Owing to the fact that the reactor coil is without a core and its magnetic field very widely distributed, particular pains must be taken to keep it away from closed metallic circuits of every kind to prevent loss of energy and even possible overheating. It is found in practice, for example, that beams, pipes and even expanded metal may be very considerably heated by acting as secondaries to the reactor coils, so that in installing reactors it is necessary to pay close attention to the surroundings. Finally, the magnetic stresses may result in drawing loose magnetic bodies into the coils and short-circuiting or injuring some of the turns. For the same reason the forces between two adjacent reactors may become high enough to cause mechanical trouble to supports in case of short circuit unless fairly liberal spacing is adopted.

Overcoming the Difficulties of Long-Span Construction

IT IS to the great transmission networks of the Pacific Coast that engineers continually look for important suggestions in power transmission. The art began there, and the Coast has continually been in the front line of progress. In particular the Pacific plants have had to deal with topographical conditions which have made their pole lines of very diversified and interesting character, especially since long spans have been used far more freely than in most other parts of the country. Not only have there been various sensational feats in spanning navigable waters but there has been a free use of uncommonly long spans in the more ordinary classes of pole construction. The difficulties which have been encountered in such work are of a rather special character, since the length of the span increases the possibility of conductors swinging into contact, a contingency quite negligible under ordinary circumstances. The stresses on the insulators and their supporting structures are increased too, and there is of course the usual rise in the stress of the conductors.

To meet these requirements it is usual to space the conductors more widely than has been the practice elsewhere, to use relatively heavy conductors, and sometimes to provide intermediate spacing devices. Just which one of these devices is most effective has to be determined in accordance with the local conditions. In some of the longer spans stranded-steel cable has been used successfully, in others composite wire, and sometimes even copper carried on a messenger cable.

For protection against the strains produced by changes of temperature at least one very interesting development has been made. The strain insulator group is attached at the tower side, not directly, but to a cable passing over pulleys, and thence to heavy concrete weights inside the tower, so that the connection is a flexible one ready to yield to the necessary degree when extra strains are imposed on the cable, and so to keep the tensions uniform. Considerable progress has been made, too, by dividing the strain of long spans between groups of insulators installed in parallel, with equalizing yokes when of the disk type.

When one realizes that in these Coast systems spans from 1000 ft. to 2500 ft. (304.8 m. to 762 m.) in length are fairly common the necessity of special engineering becomes altogether obvious. For this class of work stranded steel is being freely used regardless of voltage. A study of the suggestions contained in this particular article ought to result in considerable saving for many Eastern lines.

DECREASED net profits due to the rapidly mounting cost of operation have forced central stations to look more than ever to methods of improving economy. Among articles which will be published from time to time to show how the situation can be faced one will be presented soon giving the capitalized value of the yearly saving which can be realized from higher steam pressures. Various loads, coal prices and rates of capitalization are taken into consideration. Features of additions to the Northwest station which are touched on in this week's issue will be further noticed next week, special attention being

The Coming Issues

given to the control of auxiliary motors in the plant. A precision method of measuring alternating currents which requires relatively simple apparatus and by which all disturbing factors are eliminated or minimized so that they can be disregarded will be explained, and results of tests to show the accuracy of the method will be given. Value of flywheels for woodworking machines and methods of economizing in copper for transmission and distribution will also be discussed. The effects of daylight saving on central-station load curves and income will also be treated in articles from time to time.

The Credit of Public Utilities

Commission Regulation with Limited Rate of Return Should Be Counterbalanced by Elimination of Risk to Investors—Additional Capital in Large Amounts Must Be Attracted

BY HERBERT A. WAGNER

President Consolidated Gas, Electric Light & Power Company, Baltimore

IN THESE times, when the energy of the entire nation is being mobilized with the one object in view of winning the war, the financial resources of the country are being taxed to the utmost. Our public utilities are being called upon for more service than ever before, while at the same time their operating expenses are being greatly increased and their means of obtaining the additional capital required are being restricted in every way. It is most essential, from the standpoint of national efficiency, that these corporations should be permitted to make such additions to their charges for service as will enable them to maintain their credit.

The credit of a public utility, like that of any corporation or individual, depends upon its ability to meet its obligations. The obligations of a public utility are threefold and of equal importance to its credit—first, its obligation to the public; second, its obligation to its bondholders, noteholders and other creditors; third, its obligation to its shareholders.

OBLIGATIONS OF THE PUBLIC UTILITY

Its obligation to the public includes good service, adequate service and prompt provisions for additional facilities to furnish increased service as demanded. Its obligation to its bondholders and noteholders includes, not only the payment of interest but the maintenance of the value of its property and a reasonable equity in value above the bond and note issues. The strongest evidence of the maintenance of the required equity is in the maintenance of a fair margin in earnings above its interest obligations, and the best proof of the maintenance of such margin in earnings is the actual payment of dividends on the capital stock. On the other hand, a failure to maintain the usual dividend rate would be a direct admission of inability to maintain a normal margin.

The utility corporation's obligation to its shareholders includes not only the maintenance of the confidence of existing shareholders but also the maintenance of the confidence of the investing public, to whom the utility must apply time and again and with increasing frequency for a substantial part of the money required for expanding business and in ever-increasing amounts. No corporation can do business entirely upon borrowed capital. A substantial part of its capital must be furnished by its stockholders, and the ratio between borrowed capital and stock issued must be maintained as greater amounts of capital are required for the growth of the business.

The laws in most states prohibit the issue of public utility stock at less than par. Many issues have been put out at par or over, under the regulations and approval of public service commissions.

It is evident that, as future stock issues are an absolutely necessary part of future financing, it will be

impossible to put out additional shares at par if the market price of outstanding shares is not maintained at par or over. Manifestly the only practical course for public service commissions to pursue is to do all within their power, under the law, through the adjustment of rates for service, to maintain, in so far as may be possible, by the payment of dividends, the market value of shares issued under their approval, at prices not less than the price of original issue.

THE UTILITY CANNOT STAND STILL

The public utility is in an altogether different position from all other industrial and commercial undertakings. It cannot stand still and mark time at its will nor merely maintain its existing business. It is forced continually to expand its facilities at the demand of the public, and at an enormous rate of growth, particularly in present times. The annual new capital requirements are many times the total net income of such concerns and, by law, the earnings cannot be used to finance the growth, nor can money be diverted for this purpose from the payment of dividends.

The element of risk in the investment in public utility shares should be practically eliminated. Ordinary business enterprises succeed or fail according to their character and the demands for their products, and wise investors continue to invest only in those which appear to offer the best prospects of success. The public utility, on the other hand, cannot be permitted to rise or fall with fluctuations or changes in the opinion of the investing public in regard to its chances of success or the risk involved. Public utilities must continue in business and must continue to expand, and consequently must readily secure additional money. This involves the absolute necessity for financial success and substantial profits.

There is nothing of greater practical importance in assuring good and adequate service to the public than the maintenance of regularity in the dividend rate paid by a utility to its shareholders. In the past it has been a practice to regard shareholders as standing in substantially the relationship of partners in a business. They were supposed to be familiar with the status and fluctuations of the business and were expected to share in its ups and downs. But the corporation which has shareholders who are not active in the business or familiar with it is in a different situation, and this applies with particular force to the great public utility corporations that number their shareholders in the thousands and tens of thousands.

The great majority of the shareholders in such corporations have only the barest information as to the manner in which the business is handled and as to the results that are being achieved, and are not sufficiently familiar with the business or sufficiently interested in it to absorb more detailed information even if it were

given to them. They regard their ownership of public utility stock purely as an investment of capital that will bring them an income. They buy such stock with much the same purpose as they would have in buying a real estate mortgage, the only purpose being that of securing a dependable income with a chance of profit. The object that is actually in their minds in making the purchase is not a partnership interest in a going enterprise but the acquisition of certain certificates of stock which at regular intervals will bring them dividend checks.

To shareholders of this type regularity in their dividend returns is of the greatest importance. They count upon these returns as a fixed portion of their income. Indeed, in thousands of instances the living expenses of dependents are provided out of these dividends. In this present war time these dividends are being already substantially reduced by federal income taxes and made to bear their part of the burden imposed by the war. Further than this, the purchasing power of all money has greatly decreased under existing conditions, which in itself is equivalent to a decrease in dividend rate.

The desirability of maintaining regularity of dividend rates rests not merely upon the duty of the corporation to its shareholders but also upon a substantial advantage for the corporation itself, by reason of the fact that shares which yield regular dividends are in far greater demand by owners of capital who are not engaged in active business or who are investing their hard-won savings than those shares which are paying irregular dividends, however large these latter may sometimes be.

Out of two stock issues, otherwise equivalent, one of which is paying a permanent dividend rate year after year, and the other of which is paying dividends irregularly but averaging at least as high as the regular payer, the former issue will always sell at a substantially higher price. For this reason the corporation which has succeeded over a period of years in maintaining a record of dividend stability, and which has not changed and is not likely to change its dividend, except to raise it to a permanently higher level, enjoys the benefit of a credit and of a consequent demand for its securities which is worth an enormous amount to the corporation and to the public which it serves.

By commission regulation public utilities have been deprived of the possibility enjoyed by all other industries of taking advantage of the law of supply and demand for fixing prices and maintaining profits. Their ability to maintain profits is no longer dependent primarily upon the skill and foresight of the management, but is limited to what may be laid down from time to time as a fair rate of return on the capital invested, nor is this rate of return even assured by more than implication and the moral responsibility and self-interest of the community. The ultimate responsi-

bility lies with the public service commission, and it has been confidently expected that limitation in the amount of profits which may be earned on the investment of public utilities by such regulation would be offset and counterbalanced by the practical elimination of risk to investors and shareholders in such corporations.

By this it is not to be understood that such regulation should or could eliminate the risk incident to inefficient management (although this, to a large extent, is also under the control of the commission), nor the risk incident to depressed or subnormal general business conditions. The risk that can and should be eliminated, however, is that due to insufficient rates for service to provide for operating expenses, fixed charges and dividends; or, in other words, for the maintenance of the normally prosperous financial condition of the corporation in times of normal or expanding business. When operating expenses increase, owing to increasing cost of materials and wages, the rates for service should increase in commensurate degree.

HERBERT A. WAGNER

IS IT TO BE A GAMBLE?

If the purchase of public utility stock is to become a gamble on the part of investors, then the chance of obtaining adequate service must become a gamble on the part of the consumers.

In just so far as the risk of loss in income to the investor is minimized will the risk of inadequate service to the consumer be minimized. Additional capital in large amounts must be attracted to the utility each year to meet the growing demands of the consumer, and in order to attract the capital of the investor a record must be established and maintained for regularity and sufficiency in income-producing dividends which will not only hold the investor but will induce him, under money market conditions existing at the time, to buy more stock when it is offered.

Credit and borrowing power are not necessarily equivalent terms. While it is necessary to have good credit in order to negotiate loans satisfactorily, there are times when it is difficult or next to impossible to borrow money even with good credit. When money is plentiful almost any concern with ordinarily good credit can obtain it. When, however, there is an unusual demand for money, and for more money than there is available, then only extraordinarily good credit will command it.

At the present time the demand of the United States government for money has strained all our resources, and only those public service corporations which can show a far better credit than would be considered necessary in normal times can hope to obtain money, even at the prevailing higher rates of interest. Rates of interest are far higher than in normal times, and those undertakings which need money must not only prove their ability to pay the higher rates of interest demanded but must also show an earning capacity to

provide a higher margin above their fixed interest obligations than in usual times.

DANGERS OF DECLINE IN EARNING POWER

In these times any corporation which must admit its inability to pay its usual rate of dividends will get small consideration in the money market. The banks and trust companies throughout the country must, directly or indirectly, supply such money as the public service companies are able to obtain, and these same financial institutions are interested in one way or another in the shares of such companies, and consequently in the dividends paid. Even where banks or trust companies may not have invested directly in such shares, they are quite generally carrying loans which have been made by borrowers with such shares as collateral. Shrinkage in the value of such securities, particularly when it becomes general, creates a financial situation which not only embarrasses the investing public but the banks themselves. It is no doubt for this reason that John Skelton Williams, Comptroller of the Currency, in his last annual report to Congress, took occasion to call attention to the danger of the situation being brought about by the decline of the earning capacity of public utilities in the following words:

National and state banks and many thousands of small and large investors have suffered seriously from the decline of the earning capacity of public utility corporations and the consequent shrinkage in the value of their securities, representing investments of many hundred millions of dollars. These losses naturally diminish the power and disposition of the public to respond to the calls of the government for money for war. This danger should arouse, I venture to suggest, the anxiety and stimulate the efforts of the Congress and of every patriotic citizen. A more urgent and pressing peril is forced upon our attention by the obvious fact that we are dependent so largely on the efficiency and strength of these corporations and on our railroads for speed and success in preparing for and prosecuting the war. . . . If they are allowed to sink into inefficiency, much of the important war work will be crippled or paralyzed.

The work of war has thrown upon many of these corporations strains which they are unable to endure without prompt help. The costs of their labor and of all material for operation, betterment and upkeep have increased heavily and suddenly. They are required to increase radically and quickly their service and facilities. Industries manufacturing war munitions and materials demand of the public utilities corporations constantly greater supplies of power and light. At the industrial centers car lines are being rushed and overburdened by new armies of workers. The gas companies are called upon for gas for cooking and heating in quantities beyond all normal calculations and far beyond their present capacities. . . .

The continued and increasing efficiency of these corporations is important for the successful conduct of the war. This efficiency is not possible with present conditions. Corporations proved by their own figures to be approaching bankruptcy cannot obtain money for improvements or maintenance. On the other hand, banks and citizens suffering severe losses from investments in the securities of these entirely legitimate and once promising enterprises will be discouraged from lending money to the government or deprived of the means to lend.

The first and most direct relief to the public utilities corporations can be given by the state public utilities commissions and municipal and local authorities, with the broad-minded co-operation of the people generally, understanding the necessities of war and realizing that the more promptly its burdens are accepted the sooner they will be lifted. It is essential that forbearance and consideration be exercised by the state commissions and municipal authorities, and that the corporations also be permitted to make such additions to their charges for service as will keep in them the breath

of solvency, protect their owners against unjust loss and give them a basis of credit on which they may obtain the funds with which to meet the strain put on them by the government's needs. The breaking down of these corporations would be a national calamity.

The public utility corporations in the United States have an aggregate capitalization of more than \$10,000,000,000. Their annual operating revenues, combined, amount to more than \$500,000,000. The combined funded obligations of these utilities maturing in 1918 approximate \$225,000,000. It is estimated that they are carrying, in addition, about \$300,000,000 of short-term notes which must be refunded within from one to four years hence. These obligations cannot be met with impaired credit.

NEW JERSEY'S COMMISSION POINTS THE WAY

The attitude taken by the Board of Public Utility Commissioners of New Jersey in granting an increase in gas and electric rates upon the petition of the Public Service Corporation of New Jersey shows a broad and enlightened grasp of the financial situation and of the need of maintaining public confidence and stable security market conditions. This board has clearly pointed the way which all commissions should promptly follow to avert the national danger of which the Comptroller of the Currency has warned the country. In its opinion this board says:

Although not specifically stated therein, the petition is in effect a prayer for emergency relief on account of the extraordinary increases in the cost of labor and materials entering into the production and distribution of the company's power, arising out of the war. . . .

The board has dealt with this application as one growing out of extraordinary war conditions resulting in abnormally high costs. We have not dealt with this proceeding as we would, under normal conditions, deal with an application to increase rates. . . .

It is a matter of common knowledge that wages and the cost of fuel which make up a large part of the production expense of electric light and power companies have greatly increased, and, in fact, that all labor and supplies which must be used in the process of operating such properties and maintaining them in repair have risen greatly in price since the normal pre-war times—in some instances, in the case of supplies, the rise being more than 100 per cent. These added costs must be met. The question now presented, therefore, is whether they may with fairness be met by an increase in rates. . . .

We have not dealt with the value of the property in this proceeding. In the existing emergency the determining consideration must be to keep the property in uninterrupted and effective operation. This involves the payment of fixed rentals and charges, without regard to the value of the property, since failure to satisfy such contracted rents and charges would jeopardize uninterrupted operation.

If the revenues are not increased to meet these added costs, the moneys available for dividends will be substantially diminished. In the present financial situation the public has a vital interest in maintaining the fund available for dividends on the stock of the company. Without assurance of sufficient earnings at the present time, the company will be unable to attract new capital to finance the extensions that are required to meet war needs. A material decrease in dividends would not only result in preventing the free flow of new capital but would materially depreciate the market value of outstanding securities.

This possible shrinkage in the value and marketability of such securities would tend to undermine confidence and render unstable security markets. Such a condition would have direct influence upon the securing of money by the national government for war purposes. The required funds for these purposes must be yielded by operating revenues. In the broad view the public interest requires it.

Special Transmission-Line Problems

How Some Difficulties Peculiar to Supporting Long Spans Have Been Overcome on the Pacific Coast—Use Made of Novel Methods—Details of the Structures That Have Been Employed

METHODS of preventing the ordinary troubles which are liable to arise in connection with moderate-span transmission lines have been discussed quite fully in various articles printed in the ELECTRICAL WORLD. In this article it is the intention to consider some of the more special problems, especially those encountered in supporting long spans, and to point out how they may be solved. Practice on the Pacific Coast is cited in most instances because topographical conditions there require the use of long spans to a greater extent, perhaps, than anywhere else in this country.

In some places where long spans are required—for instance, over rocky country or places cut by deep ravines—it is possible to place the supporting structures in elevated places, so relatively short poles can be used. In other places, however, where large bodies of water must be crossed or where long stretches of ground are level but of such a nature that it is difficult to set poles satisfactorily, additional problems are imposed inasmuch as tall towers may be required.

PROBLEMS PECULIAR TO LONG-SPAN CONSTRUCTION

Regardless of whether tall or short supports have to be used, special problems are encountered which might be only incidental with moderate-length spans. For instance, with long spans there is more of a tendency for the conductors to swing into metallic contact with each other, larger stresses have to be transmitted through the insulators to the supporting structures, excessive strains have to be avoided in the conductors and other similar conditions arise. Provision must also be made to withstand the whipping action of the conductors when they are subjected to gusts of winds and also to prevent failure of the towers in case the long spans break.

The possibility of the conductors swinging together can be avoided or minimized in several ways—by spacing the conductors liberally, by using conductors which are relatively heavy compared with the area exposed to wind pressure, by using intermediate spacing structures, by minimizing the sag, and by artificially weighting the conductors. The first three methods are used most extensively, both singly and collectively.

The sag can be minimized, of course, by employing extra high strength conductors, but this method increases the strain on the towers and makes them more expensive. Providing liberal spacing at the supporting structures also makes the latter more expensive, since longer cross-arms have to be used. Only detailed analysis of each case will determine which method is most economical. Even where suspension insulators could be used, as may be practicable where the adjacent spans are sufficiently long to balance each other, it may be advisable to use pin or strain insulators to prevent conductor deflection, which can occur if suspension insulators are used.

The clearances ordinarily required over rights-of-way

do not usually impose so great a problem as those over navigable streams. Where the structures at each end of the long span can be erected on elevated ground the expense and engineering problem of designing and providing mechanically satisfactory towers are considerably reduced, as they can be made relatively short. This cannot be done in many cases, however, and therefore tall towers have to be employed or conductors with very high tensile strength have to be used to permit reducing the sag, or both.

In one case in the Northwest the expense of tall steel structures was avoided by splicing wood poles together

FIG. 1—TYPES OF CONSTRUCTION USED ON 45,000-VOLT LINES FOR THREE DIFFERENT CONDITIONS AND 600-FT. TO 1500-FT. SPANS (GREAT WESTERN POWER COMPANY)

and making H-frame towers which were cross-braced and guyed at numerous points. In another case the conductors were supported on a saddle carried by several pin insulators and the ends dead-ended at a special structure near the ground, thus avoiding the excessive bending moment which would have been exerted on the tower if strain insulators were used. This construction was not used so much for this reason, however, as to avoid depending on the tensile strength of disk insulators.

Various methods of preventing excessive stresses in the conductors have been employed. Sometimes the conductors are supported at such an elevation that large sags can be permitted. In other cases stranded steel wire of extra-high tensile strength or composite wire such as copper-clad steel, steel-core aluminum and stranded cable with a steel core has been used. Even high-strength steel messenger wire supporting a copper conductor has been employed.

NOVEL METHOD OF SECURING UNIFORM TENSION

Allowance for expansion and contraction of the conductor due to temperature changes is especially necessary on long spans as the wires may be worked nearer the safe margin of their tensile strength than on moderate-span lines. In one case compensation for this change in conductor length is provided for to insure

uniform tensile strength at all times by attaching the tower side of the strain insulators to cables running over pulleys, thence down to large concrete weights inside the tower near the ground. The weights are provided on only one end of the span. Incidentally the construction relieves the insulators from sudden strains due to whipping of the conductors and reduces the bending moment on the tower on which they are installed.

Transmission of the conductor stresses to the supporting structures is a problem of no little importance on long spans. If pin-type insulators are used, it is necessary to support the conductors on them in such a way that no bending moment is exerted on the pins, and furthermore if several pin insulators are required to carry each conductor, as may be the case with exceedingly long spans, the stress must be evenly distributed over them. If disk-type insulators are used,

two-horse vehicle so that the strings of insulators can be placed in one plane. Other yokes are constructed on the same principle, but the equalizing bars are arranged so that the insulators can be placed in two parallel planes as shown in the illustrations. In attaching the conductors to the insulators care must be taken not to bend the wire in too sharp a radius and not to injure the skin with clamps. In some cases the wires are bent around small pulleys attached to the insulators. When aluminum wire is used aluminum sleeves are advisable to protect the wire from the clamps.

SURFACE LEAKAGE

Surface leakage has caused more trouble than actual failure of insulators on the lines of the Southern Sierras Power Company, Riverside, Cal. In the dry climate of that section practically all the moisture in the poles

FIGS. 2 AND 3—TRANSPPOSITION ON 100,000-VOLT LINE (GREAT WESTERN POWER COMPANY); LONG-SPAN ANCHORAGE WHICH IS HOUSED FOR SAFETY AND TO PROTECT INSULATORS (PACIFIC GAS & ELECTRIC COMPANY)

it is not safe to depend on one string of insulators for transmitting the stress, at least for spans more than 1500 ft. (457 m.) in length. The real decision should be based, of course, on the tensile strength of the disks used and the margin of safety considered necessary.

TRANSMISSION OF STRESSES TO SUPPORTS

One case in which pin insulators are used very successfully for supporting an exceedingly long span is at Carquinez Straits, this construction being referred to before. A saddle is provided over the insulators (several are used to support each conductor) to distribute the stress and also allow the conductor to slide and thus prevent lateral stresses in the insulators. Each conductor is dead-ended by being served around a pulley and clamped, the pulley in turn being connected to a yoke pressing against multiple pin insulators. Springs are connected between the pulley and yoke to relieve suddenly applied stresses.

Where disk insulators are used for transmitting the conductor stresses to the supporting structure they are usually connected in parallel for spans above 1500 ft. (457 m.) in length. There is not much difficulty in dividing the stress between two parallel strings, but with more than two there may be some unless properly designed equalizing yokes are employed. Some yokes for this purpose are arranged like the whiffletree on a

and cross-arms evaporates so that the leakage from the iron pins chars and even burns the wood. To remedy this trouble the pins are metallicly connected by means of No. 9 galvanized iron wire stapled to the cross-arm and pole. The connection to the pins is made by wrapping the wire around the pin bolts under the washer and clamping it in place by screwing up the nuts.

At such places as river crossings and over rough country subject to slides and indented by deep ravines the Puget Sound Traction, Light & Power Company, Washington, employs spans of two to three times normal length supporting the conductors on A-frame towers made of two poles set 12 ft. (3.6 m.) apart at the base and bolted together at the top. No. 4 hard-drawn solid copper and No. 4/0 and No. 2/0 seven-stranded aluminum conductors are used on the long spans. The wires are supported in triangular formation 7 ft. by 9 ft. (2.1 m. by 2.7 m.) apart. No difficulty has been experienced from the wires swinging together.

Wherever possible the wires are strung so that the tensions on each side of the supports are equal. Where this is impossible the conductors are dead-ended by strain insulators fastened to the cross-arms by eyebolts, and the towers are back-guyed. The aluminum wires, where dead-ended, are protected from damage by the clamps by aluminum sleeves 1/16 in. (0.15 cm.) thick. Long spans are computed for a stress in the con-

ductor up to the elastic limit at 0 deg. Fahr., a wind pressure of 50 miles (80.4 km.) per hour and a $\frac{1}{2}$ -in. (1.3-cm.) coating of ice. Wherever the ground clear-

FIGS. 4 AND 5—UNIFORM WIRE TENSION MAINTAINED BY COUNTERWEIGHTS

Tower-ends of insulators attached to cables leading over pulleys and running down to concrete counterweights weighing 10,800 lb. each. The span is 1792 ft. long, the conductors are made of $\frac{3}{8}$ -in. galvanized crucible-steel track cable, and four strings of five insulators are connected in multiple. (Portland Railway, Light & Power Company.)

ence in the center of the span will permit, 10 per cent more sag is allowed than is usual.

On the Drum-Cordelia line of the Pacific Gas & Electric Company are two long spans, 4534 ft. (1382 m.) and 4033 ft. (1229 m.) in length respectively. The con-

The anchorage at the terminal towers consists of four strings of eight Ohio Brass Keokuk type insulators assembled in such a way that the total tension is evenly distributed between them. As originally equipped, seven sets of insulator disks were used, but the number has been increased to eight to provide a larger insulating safety factor. Both spans are subjected to severe stresses at times owing to snow and sleet, but have given satisfactory service since 1913.

DETAILS OF SOME STRUCTURES EMPLOYED

Long spans are ordinarily divided into three classes by the San Diego Gas & Electric Company, viz., spans of from 1000 ft. to 1500 ft. (305 m. to 457 m.), of 1500 ft. to 2500 ft. (457 m. to 762 m.) and of 2500 ft. (762 m.) up. Two-pole structures without cross-bracing, known as type T, are used on spans of 1000 ft. to 1500 ft. Two-pole structures with cross-bracing, called type U, are employed for spans of 1500 ft. to 2500 ft. where the adjacent spans are less than 1500 ft. Two pole structures with cross-bracing, distinguished as type V, are used for spans of 1500 ft. to 2500 ft. where adjacent spans likewise exceed 1500 ft., and three-pole structures, known as type S, are used for spans exceeding 2500 ft.

Conductors.—Regardless of the voltage, the conductors are of seven-strand extra-galvanized steel in one of three grades—high strength, extra high strength, or a quality which falls between the two, manufactured especially for telephone messenger cables. For spans of from 1000 ft. to 2500 ft. considerable $\frac{3}{8}$ -in. (9.5-mm.) high-strength (11,500-lb.) steel has been installed. A large quantity of 7/16-in. (11.1-mm.) special high-strength (18,000 lb.) steel has also been used on spans of 1000 ft. to 3000 ft. On one span of 3069 ft. (936 m.)

FIGS. 6, 7, 8 AND 9—SOME LONG-SPAN STRUCTURES

The spans adjacent to the structure shown in Fig. 6 are 1175 ft. and 1325 ft. No. 1/0 A. W. G. seven-strand medium hard-drawn copper is used. Fig. 7 indicates a 135-ft. wood structure made of laced poles supporting a 1611-ft. span. (Pacific Power & Light Company.) On the structure shown in Fig. 8 the anchorages con-

sist of four strings of eight strain insulators in multiple. (Pacific Gas & Electric Company.) Fig. 9 represents a type U tower with 66-kv. line above and 11-kv. line below. This tower is set in concrete because of marshy soil. (San Diego Consolidated Gas & Electric Company.)

ductors consist of $\frac{3}{4}$ -in. (1.9-cm.) nineteen-strand copper-clad steel and are placed 20 ft. (6.1 m.) apart. To prevent their swinging a spacing tower is erected in mid-span at a lower grade than the terminal towers; thus it has to support only a fraction of the weight.

the company employs 7 16-in. (11.1-mm.) extra high-strength (22,500-lb.) steel.

At the point of attachment to the towers the conductors are usually bent around a cast-iron pulley wheel and are held by three or more three-bolt guy

clamps. All long spans are sagged with a dynamometer, and a record is kept of the tension and stringing temperature of each span. No sleet is allowed for in the design, as none occurs in this territory.

Insulators. Only one type of insulator is used independent of voltage. This is Locke No. 3538, having an average ultimate strength of 12,500 lb. (880 kg. per sq. cm.). On type T towers they are used in single strings; on type U and V structures in parallel strings, balanced by means of steel yokes, purchased from Pierson, Roeding & Company and especially manufactured for this company. On type S towers four parallel strings are used, spaced and balanced with double sets of interconnected strain yokes. For voltages of less than 11 kv. single insulators are used; for 11-kv. lines two insulators are used in each string, and for 66-kv. lines five per string.

Poles.—Class A, Western red cedar poles especially selected with large tops, are used when available; the butts being open-tank-treated. Type U structures have been constructed of a variety of sizes of poles from 40 ft. to 75 ft. (12.2 m. to 22.9 m.), depending on the clearance required. Some structures built on hillsides require poles of two different heights. Type S towers are ordinarily constructed of two 45 ft. (13.7-m) pole and one 60-ft. (18.3-m.) pole.

Where poles are erected in marshy ground or sandy soil they are set in concrete to obtain a greater bearing area and for protection against deterioration.

The guys are ordinarily made of the same material as the line conductor. Each pole is usually held by three guys. In addition to the main back guy, side guys

kg.). Two three-bolt guy clamps are used at each point of attachment, the strain insulators being similarly equipped with three-bolt guy clamps rather than wrapped splices. Galvanized-steel anchor rods $\frac{3}{4}$ in. (1.9 cm.) by 8 ft. (2.4 m.) long are used.

On type T towers the conductors are supported in a horizontal plane, each outside wire being separated from the middle one by a distance of 6.5 ft. (2 m.) On type U and V towers single cross-arms are used, the conduc-

PRESENTING A CASE BEFORE PUBLIC UTILITY COMMISSION

Advice Concerning What to Do and What Not to
Do in Order to Expedite the Handling of an
Appeal for a Rate Revision

BY HAROLD L. GEISSE*

Secretary Railroad Commission of Wisconsin

THE utility desiring to obtain an increase of rates or the public desiring to contest an increase or to secure a reduction of rates usually confidently seeks the assistance of a lawyer, with a sublime trust in the ability of the legal profession to know what to do before any public body or on any public occasion. The lawyer, however, even though most skillful in the trial of cases before a court or jury, is very often as much at sea as his client on what to prepare for the hearing and how to present it. The result is that the commission is obliged to resort to an inquiry into the books and accounts of the company and to a statistical analysis of the operating performance of the plant for some years back or to extended service investigations in order to obtain facts upon which to determine whether or not the relief sought is justified, and in a fair percentage of the cases the record of the hearing is encumbered with a mass of irrelevant testimony, inexpert opinions and even vituperation, to which the commission has been obliged patiently to sit and listen.

One of the recurring incidents in the taking of hearings is the attempt to influence the judgment of the commission by the introduction of prejudicial matter. This is a method to be deplored, totally ineffective and unworthy of notice by opposing counsel.

THE PROPER SCOPE OF THE COMMISSION

The commission is not a court of law. Its business is to fix rates, to pass upon the character and quality of service, to pass upon rules and regulations under which service is given, to inquire into the methods of keeping accounts and the business management, to prevent the interference of one utility's lines and facilities with those of another, and to approve methods of construction. In performing these functions it is interested solely in finding out the facts. It is concerned in accounts, in operating statistics, in unit costs, in prices of materials and supplies, in coal costs, in values of property, in measurements and surveys, in traffic counts and in the opinions of experts.

One cannot attempt to outline a procedure for each character of case that may come before the commission. A service case will differ much in its method of presentation from a rate case, but, to illustrate how plain and matter-of-fact a case may be made, one can follow through in its simplest form a typical case in which rates are involved.

The elemental question in which the commission is concerned in a rate case is the determination of the value of the property used and useful in the service of the public. It is upon this fair value that the lump sum to be allowed as return is based. The lower the value found, the lower will be the rate schedule. In determining the ultimate fair value, the physical value of the tangible property, the amount of going value and the necessary working capital to be allowed must all be

considered. The opportunity to affect the judgment of the commission commences with the engineering appraisal of the physical value of the property. The engineers of the commission have returned their report upon the physical value, and copies of the report have been submitted to both sides in the case. It is possible that in making the appraisal the engineers have overlooked some element of the property, have failed to allow for mishaps in building the plant which increased the money expenditure necessary to its construction, or to make allowances for other elements. On any of these points the commission would be glad to have enlightening testimony.

THE DIFFICULT QUESTION OF "GOING VALUE"

Having concluded the testimony on the physical valuation, the amount of going value and of working capital to be allowed are considered. The various theories of computing going value as discussed in textbooks, prior decisions and monographs of experts furnish a fertile field of inquiry for persons preparing to present a case before a commission, and the amount of working capital necessary to conduct any particular business is sufficiently vague and uncertain to afford the litigants opportunity to present very helpful testimony.

Completing the inquiry into the value of the property, an analysis of the expenses becomes necessary to determine that no improper charges are being included and whether or not the property is being fairly economically managed. If the case under consideration arises through a public attack on the rates charged, it is probable that the representatives of the public will be able to present little testimony of any considerable assistance. Frequently testimony is introduced showing that the rates charged by the company under attack are in excess of those charged by other plants similarly situated in communities of approximately the same size. Such testimony is usually of little significance because of the factors that make the amount of the investment and the operating costs vary in different communities.

If, on the other hand, the case arises through an application of a company for authority to increase rates, the company should be able to present a thorough analysis of its operating costs and earnings, together, if possible, with graphic charts showing tendencies over a long period. Prepared with sufficient care, such a statement can be of material assistance to the commission. Data relative to the degree of saturation attained in the community, presenting a statement of the kilowatt-hour sales per capita and the gross earnings on the per capita basis, can frequently be shown with considerable effect.

In placing these data in evidence an officer of the company should be prepared to explain them in detail, answering any questions relating thereto that may be propounded either by the commission or by representatives of the public. Similarly, carefully prepared data should be provided for presentation in any service case, the object being constantly in mind to cut down the extent of inquiry that the commission must make independently after the hearing before decision can be rendered. With the figures carefully compiled, introduced and explained at the hearing, only such investigations would be required as would satisfy the commission of the fairness with which they have been com-

*Excerpts from a paper read before the Wisconsin Electrical Association.

piled, their completeness and the safety with which conclusions may be drawn from them.

It is true that the commission has a more or less complete mechanism for the ascertainment of the facts in any inquiry it may be called upon to make. This is necessary in order that the evidence introduced in a case before it may be tested by subsequent independent investigation and that accounting and engineering assistance may be rendered to utilities and municipalities operating utilities. It is taking an advantage of the commission, however, for a utility to presume that the possession of a staff of engineers, accountants and investigators renders it an available agency for the investigation of the utility's affairs when the utility feels itself in need of aid in the way of higher rates or relief from service requirements. The utility, having full

access to its own books, records and accounts, should, before seeking relief, prepare itself to draw its own conclusions as to its needs and the reasons therefor and should be in a position to convince the commission of the fairness of its cause.

A somewhat different situation exists where the public invokes the jurisdiction of the commission in securing relief from high rates or inadequate service. There the complainant has not the machinery at hand to conduct its own inquiry, but is obliged to depend to a greater or less degree on the inquiries made by the commission. Even here, however, the person in charge of the case, be he city attorney or private counselor, should have a sufficiently well prepared outline to present clearly the issues he wishes to draw and the grounds for the public belief that relief is justifiable.

Installation and Care of Reactors

Some of the Factors Which Are of Vital Moment in Their Operation but Which Are Usually Not Within the Control of the Designers Are Emphasized in This Article

BY M. E. SKINNER

Transformer Engineer, Westinghouse Electric & Manufacturing Company

CURRENT-LIMITING reactors are rapidly becoming indispensable adjuncts to electrical power-plant equipment, especially where a large source of power is concentrated in one plant—a marked characteristic of modern central station development. During the early days of the electrical industry the apparatus was of such small size and voltage that mechanical problems were not developed. With the increase in the size and concentration of generating equipment, however, the mechanical forces increased until weaknesses made themselves apparent, and to-day the electrical engineer's problems are probably as much mechanical as they are electrical.

WHERE WEAKNESSES FIRST APPEAR

Among the places where mechanical weakness first became evident may be mentioned the end windings of generators. Investigation disclosed that a majority of the early high-speed generators of large capacity would not stand a dead short circuit without considerable distortion of the end windings. There were two principal reasons for this weakness—first, the low inherent reactance of the early machines, which were built primarily for the close regulation demanded by a lighting load; second, a lack of appreciation on the part of designing engineers of the tremendous forces which could be developed. To protect such generators it was necessary to supply external reactors to limit the current under short circuit, as it was usually impossible to brace the windings more thoroughly without rewinding the machine. Modern machines combine high reactance with more thorough bracing in order to withstand the stresses due to dead short circuit.

The solution of the generator problems did not clear the situation, however, but simply removed the limitation from the generators to the next weakest link in the system. Whether this involves the circuit breakers, bus

structure, transformers and other apparatus or not, the point is that as the available power back of a short circuit increases and the system becomes more nearly able to maintain its full voltage it becomes necessary to limit in some way the current which can be fed into the fault. Reactors have met this requirement quite satisfactorily.

The questions of how much reactance is required and where it should be placed in order to give the maximum protection have been the subject of numerous articles in the trade and technical papers¹ and they will not be discussed here. However, there are some factors which are vital to the successful operation of reactors that will be discussed as they are usually not under the control of designing engineers.

AIR-CORE REACTORS TO LIMIT CURRENT

Air-core reactors are invariably used for current-limiting purposes. Since this type of reactor is surrounded by a widespread magnetic field, it is impossible to immerse them in iron oil tanks without developing a very large stray loss. On account of the high temperatures caused by short-circuit currents, it is also impossible to use inflammable material for insulation. The common form of air-core reactor is a cylindrical coil with the turns supported at suitable intervals by a fireproof and non-magnetic structure. The conductor is bare and adjacent turns are insulated from each other by the air or by the supporting structure. The reactor problems which the central-station man is likely to encounter may be traced either to the limitations of

¹"Protection Against Short Circuits," *Electric Journal*, Vol. X, p. 1217; "Protective Reactances for Large Power Systems," *Proceedings A. I. E. E.*, February, 1914, Vol. 33, p. 141; "Protective Reactors for Feeder Circuits of Large City Power Systems," *Proceedings A. I. E. E.*, October, 1914, Vol. 33, p. 1663; "Current-Limiting Reactances on Large Power Systems," *London Electrician*, Vol. 72, p. 1046; "Selection of Power-Limiting Reactances," *General Electric Review*, Vol. 17, p. 604; "The Application of Current-Limiting Reactors," *Electric Journal*, Vol. 13, p. 280.

air insulation or to those imposed by the widespread magnetic field.

The voltage across a current-limiting reactor, when carrying normal current, is seldom much more than 5 per cent of the voltage of one leg of the system. With the large number of turns which is usually required in a reactor, the voltage between adjacent turns under these conditions is below the value necessary to maintain an arc in air. However, under short circuit the voltage across the coil rises directly with the current, and it is under these conditions that there is danger of breaking down the air which constitutes the insulation. If the coils are installed on an ungrounded system, there is an additional element of danger introduced in the form of possible high transient voltages due to arcing grounds.

AIR A DEPENDABLE DIELECTRIC

Air itself is the most dependable dielectric which we have at our disposal. The difficulty lies, not with the dielectric, but rather in the ease with which it may be contaminated. Moisture, either rain or steam, metallic vapors or dust will lower the strength to a greater or less extent, depending upon the amount of the foreign substance present. Reactors are, therefore, fundamentally indoor apparatus. They should be housed so as to preclude the possibility of inclement weather affecting their insulation strength. They should not be installed where they will be exposed to steam, as even an amount so small that it would not weaken the air might condense on the surface of the structure supporting the turns and cause a breakdown at this point. Metallic vapors or dust have about the same effect. In no plant is it possible to eliminate dust completely, and for this reason a periodic inspection and cleaning of reactors is recommended. Providing a smooth surface on the reactor structure between turns will do a great deal toward minimizing the accumulation of dirt.

On account of the very high temperatures which may be attained under short circuit, inflammable material should not be used around reactors. The reason for the high temperature is that the heat-storing capac-

The short circuit conditions to which a coil will be subjected rather than the current which it is to carry normally should fix the rated temperature rise. The ultimate temperature which a coil will attain under short circuit depends upon the temperature just prior to the disturbance and the amount of copper in the coil. It is given approximately by the following relation:

$$T = \frac{(1 + cT_0) e^{R_0 I^2 ct / 180 W}}{c} - 1$$

Where T = final temperature in degrees C.

T_0 = temperature of the copper just prior to the short circuit in degrees C.

t = duration of short circuit in seconds.

R_0 = resistance of copper at temperature T_0 in ohms.

W = weight of copper in pounds.

I = short-circuit current in amperes.

c = coefficient of resistance per degree C.; = 0.00427 for copper.

e = base of Napierian logarithms.

Applying this formula to the case of 2 per cent and 5 per cent coils of the same current-carrying capacity having the same cross-section of copper we find that, though they operate at the same temperature when carrying full-load current, the 2 per cent coil will reach approximately 1150 deg. C. after a dead short circuit lasting two seconds, as compared with only 200 deg. C. in the case of the 5 per cent coil. From this example it is evident that the lower the percentage of reactance for a given current-carrying capacity the greater should be the cross-section area of the copper and, therefore, the lower the temperature rise under normal full-load current.

The amount of heat generated within the reactor can be controlled more or less largely in the design. Such provisions as the use of stranded conductors and the equalization of the impedance of parallel circuits, with consequent reduction in circulating currents, will do much to prevent excessive heating within the coil. To avoid a large expenditure for protection, it is common practice to design reactors so that a short circuit last-

FIGS. 1, 2 AND 3—VARIATION IN FORCE EXERTED BY REACTORS ON EXTERNAL MAGNETIC OBJECTS UNDER DIFFERENT CONDITIONS

If both currents are in phase, the force is unidirectional and insulating, as shown in Fig. 1. The effect of a phase displacement between the currents is to shift the curve toward negative values. As the angular displacement increases, the positive and negative peaks become more nearly equal, until when the currents are in

quadrature the force alternates between equal positive and negative values, as shown in Fig. 2. If the displacement between the currents is still further increased, the shifting continues until, with currents completely out of phase, the conditions shown in Fig. 3 exist.

weight of the parts of a reactor exclusive of those carrying current is negligible. Unlike a generator, a reactor has no heavy iron core and frame, nor is it immersed in oil like a transformer, either one of which will absorb the extra heat generated on short circuit so rapidly that the duration of the high temperature in the copper is generally not sufficient to injure the insulation.

ing approximately two seconds will not cause the temperature to reach dangerous values. This corresponds to automatic operation of the circuit breakers, with the maximum relay setting that is now considered good practice. In the case of bus-tie reactors the design should be more liberal. The designer should be informed of any special conditions, such as hand opera-

tion of circuit breakers, which might increase the length of time the reactors will be required to carry short circuit currents.

EXTERNAL CONDITIONS AFFECT HEATING OF REACTORS

Unfortunately, the heating caused by a reactor is not all within the coil. The heat developed outside a reactor is due to the widespread magnetic field which surrounds the coil. It is of two kinds—first, electrical heating caused by the circulation of currents by transformer action in neighboring closed metallic circuits; second, magnetic heating caused by the alternat-

of concrete floors and walls, where the temperature rise of the steel work must be kept low to avoid cracking the concrete.

To demonstrate the relatively great distances through which the magnetic field of a reactor is exerted, it is only necessary to walk past one when it is under load with a bunch of keys or other magnetic material in one's pocket. The attraction is quite considerable even some distance from the coil. Instances have been known where the number of ampere turns concentrated in a single air-core reactor has been as high as 135,000 under normal rated load, increasing to

FIG. 4—AN INSTALLATION IN WHICH REACTORS ARE USED EXTENSIVELY

ing field in adjacent iron structures. A reactor may be considered as the primary of an air-core transformer to which any conducting circuit in the vicinity becomes a secondary. The current which will circulate in any secondary depends upon the closeness with which the primary and secondary are linked together, and upon the impedance of the secondary circuit.

The most common sources of trouble on this account are formed by the structural steel work of floors and ceilings, pipe railings or angle-iron frames supporting screens. To avoid trouble, either the coupling of the circuits must be made very loose or the impedance of the secondary must be made large. The former may be accomplished by arranging the reactors so that they are not coaxial with the meshes in the steel work and by using insulating joints in the pipe or angle frames and railings. Where it is impossible to avoid placing a reactor directly over or under such a closed circuit in the steel work the amount of circulating current can be minimized by increasing the distance between the coil and the steel work as much as possible.

In addition to the loss just described there will be a certain amount of heating in any magnetic material adjacent to a reactor due to hysteresis and eddy currents. The loss from this source depends upon the frequency and upon the flux density and can be limited only by keeping the material far enough away to limit the density. One of the most common places where this trouble is encountered is in the reinforcing

the enormous value of 1,700,000 ampere turns under short-circuit conditions. However, as the latter condition is only momentary, it need not be considered with regard to its influence on the heating in surrounding objects. The sphere of influence of a reactor not only depends on the number of ampere turns in the coil, but also, to a very large extent, upon the dimensions and the proportions of the coil. In general, the greater the diameter and the less the axial length the greater will be the area through which the field is exerted.

The temperature rise of magnetic material in the vicinity of a reactor is very much affected by the conditions of ventilation. Some results which were derived from tests are given in the table on the following page. Although the results thus attained cannot be applied directly to another installation, they indicate in a general way what may be expected and show the effects of the location and character of the material upon the temperature rise. The dimensions of the coil used for this test were as follows: Diameter over outside turn, 51¼ in. (130 cm.); diameter of inside turn, 37¾ in. (95 cm.); axial length, 73 in. (185 cm.); turns, 54; current, 1600 amp. at 25 cycles.

FORCE EXERTED ON EXTERNAL OBJECTS

Force is an instantaneous quantity, and the capacity which it has for doing damage is dependent upon its maximum value as contrasted with the temperature rises, which depend upon the average value of the

heating. Force coming from the interaction of alternating currents is always pulsating, being unidirectional at times and alternating at others (see Figs. 1, 2 and 3).

The peak value of the force is twice as great when the currents are in phase or completely out of phase as it is when they are in quadrature. The force may be considerably increased during the first instant of a short circuit owing to the unsymmetrical nature of the currents during this interval.

GENERAL LAW GOVERNING INTERACTION OF CURRENTS

The general law which governs forces coming from the interaction of electric currents is that the force is always in such a direction that the movement produced

*Tests (3) and (4) show the effect of the heat carried to the magnetic material from the coil by convection.

will increase the total amount of flux and the back emf. of the system. Applying this law to the case of an air-core reactor, four distinct kinds of stress may be produced:

(1) A stress between adjacent turns which tends to compress the current-carrying parts into a minimum cross-section at their electrical center. This crushing force tends to shorten the length of the restricted flux path and thereby to increase the flux.

(2) A stress on the whole coil, tending to increase the diameter and in that way decrease the reluctance and increase the flux.

(3) An attraction between the coil and any magnetic material in the vicinity. The greater the proportion of the total flux path which lies through magnetic material the lower will be the reluctance of the circuit. The force, therefore, tends to pull the magnetic material closer to the coil in an effort to decrease the reluctance.

(4) Mutual stress between adjacent reactors, which may be attraction or repulsion, depending upon the phase relation of the currents, but which always acts in a direction to increase the flux.

The first two stresses mentioned above are entirely within the coil and cannot be influenced by the method of installation. The third type of stress has been proved by experience to be small enough to be neglected in most cases. If both reactor and metal work are securely fastened down, it will usually be found that the steel work will heat up unduly before the attraction becomes large enough to cause trouble. However, care must be exercised to make sure that there are no small magnetic bodies loose in the vicinity of the reactor which may be pulled into the coil, resulting in a short circuit between some of the turns. This is a danger which is often not fully appreciated. As pointed out previously, the number of ampere turns which are active at times of short circuit is often very large. At such times a reactor will attract loose magnetic material of considerable size. Bolts, nuts, screws and small tools, such as pliers and monkey wrenches, are among the things which should be particularly kept away from reactors. The writer knows of one reactor failure which was directly traced to trouble of this description.

The fourth type of stress—namely, the mutual force between adjacent reactors—depends upon the spacing of the reactors and upon the relative phase relations of the currents flowing through them. Methods have been developed for calculating these stresses to a very fair degree of accuracy. These methods all depend upon the principle that the force between two coils is proportional to the space rate of change of the mutual inductance between them. For the case of two coaxial coils, one above the other,² the methods are quite accurate. The case of two coils side by side on the same level, the axes being parallel,³ is more difficult and the results will probably be more approximate. In general, formulas involving mutual inductance are rather tedious to work with, so that a rough and ready rule is perhaps of more value to the central-station man than the actual method of computing the stress. At least such a rule will serve to indicate when the more complicated computation should be carried out.

It has been found that when the adjacent reactors are separated by one-third of their diameter when side by side and one-half of their diameter when coaxial the mutual forces due to short circuits are within safe limits and external bracing between reactors will generally not be required. This rule applies only to three reactors on a three-phase circuit and is in terms of diameter over copper and separation from copper to copper. The arrangement which should especially be avoided is that where adjacent reactors may simultaneously carry short-circuit currents in phase with each other. This condition is likely to arise when two adjacent feeders enter the same substation or are carried in the same cable duct. A short circuit on the substation busbars, or a short circuit in one cable, which is severe enough to communicate itself to other cables in the same duct would then cause both of the adjacent coils to carry very heavy currents. Since the force is proportional to the product of the currents and turns and the currents are likely to be in phase, this condition will result in very high stresses.

Six-Unit Station Will Develop 165,000 Kw.

Some Features of the Latest Additions to the Northwest Generating Station of the Commonwealth Edison Company, Where Some 30,000-Kw. and 35,000-Kw. Units Are at Present Being Installed

SINCE the last article* on the Northwest generating station of the Commonwealth Edison Company appeared in the *ELECTRICAL WORLD* a considerable addition to the plant rating has been made and the design which was originally followed has been improved. To the original installation of two 20,000-kw., 4500-volt, 25-cycle machines have been added one 30,000-kw. and one 35,000-kw., 25-cycle, 9000-volt machine and two 30,000 kw., 60-cycle, 12,000-volt machines. One of the latter is still under erection and is expected to go into service within a short time. One of the original 20,000-kw., 25-cycle, 4500-volt machines (unit No. 1) has been temporarily equipped with a 60-cycle, 12,000-volt armature. As the station stands, therefore, it will be able to produce, when completed, 85,000 kw. of 9000-volt, 25 cycle energy and 80,000 kw. of 60-cycle, 12,000-volt energy. It will be among the largest stations in the world in point of total rating and for some years will probably be the only station able to produce 165,000 kw. from as few as six machines.

The coal-handling system, the water system and the general building plans have been completed as origi-

the first two units under the boiler-room floor instead of above. This change was made to secure greater flexibility.

The big changes were made in the turbine room. The features of the recent design here are in the large machines themselves, in the change from steam to electric drive for auxiliaries, in the excitation system, in the installation of a 440-volt power system for the principal auxiliaries, and in the relay and protective equipment.

The horizontal machines were installed on a level nearly 11 ft. (3.4 m.) higher than the vertical machines to give room for large condensing equipment and auxiliaries. The arrangement and numbering of the units is shown in Fig. 2. This layout was selected because it permitted the 25-cycle and 60-cycle switching equipment to be kept separate and at the same time eliminated any necessity of crossing the generator cables on their routes to the switch house.

Unit No. 6 is a compound reaction turbine driving a 60-cycle, 12,000-volt, three-phase star-connected generator rated at 30,000 kw. at 85 per cent power factor,

FIG. 1—ONE OF THE NEW TURBINE-GENERATORS RATED AT 35,300 KVA., 60 CYCLES AND 12,000 VOLTS

nally contemplated. In the boiler room a few changes were made. Ten boilers per unit without economizers were installed for the first 20,000-kw. machines. Five double boilers for the first 30,000-kw. unit were installed without economizers, on account of building limitations. For each of the last three horizontal units the steaming equipment consists of five double boilers with economizers. Another change in the boiler room consisted of installing the stoker drive for all except

or 35,300 kva. The turbine is of the tandem compound type, the two elements being connected by a solid flange coupling. The generator is connected to the turbine through a flexible coupling so that the three rotors turn as a unit. The turbine is served by two condensers. This machine, unlike unit No. 4, has no built-in fan for cooling the generator windings but is equipped with an external motor-driven blower. The 60-cycle unit, No. 5, now being erected is a duplicate of unit No. 6.

All of the horizontal units are equipped with direct-connected 230-volt exciters. The 125-volt excitation for the two 20,000-kw. vertical machines is supplied by a

*Other articles in the *ELECTRICAL WORLD* dealing with the Northwest station of the Commonwealth Edison Company were published in the issues of March 17, 1910; June 1, 1911; Oct. 5, 1912; Jan. 11, 1913, and May 31, 1913.

300-kw. steam-driven and a 200-kw. motor-driven exciter. The motor-driven exciter has a sufficient range of voltage to permit it to be used for charging the control batteries. A system of connections has been installed by means of which this machine may be used as a reserve source of excitation for the horizontal units. Control of the field of each horizontal unit is accom-

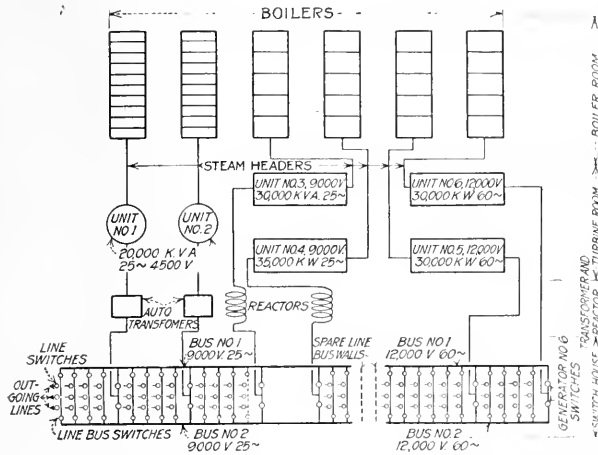

FIG. 2—ARRANGEMENT OF UNITS THAT PERMITS KEEPING 25-CYCLE AND 60-CYCLE EQUIPMENT SEPARATE

plished by manipulation of the exciter field rheostat, which is remotely controlled from the bench board in the operating gallery. A double-throw selector switch is provided so that the field rheostat of the reserve exciter can be controlled by the normal field-control switches when desired (Fig. 3).

The advantages of this scheme of connections are that it permits control of a unit from its own control panel, and after a change-over from normal to reserve excitation has been made the method of operation is not changed. The selector switches and solenoid-operated generator field switches, as well as the field rheostats for each direct-connected exciter, are grouped in sheet-iron cabinets on the turbine-room floor adjacent to the base of the unit they serve, except in the case of unit No. 4, where a special panel has been installed near the unit. Here they are readily accessible for inspection or emergency operation.

The previously mentioned selector switch is of the double-blade type to permit the selection of the normal or the reserve source of excitation without interruption of generator load. Both the double-pole, solenoid-operated generator field switch and the ammeter shunt are connected in the leads to the generator field so that the same equipment serves in both normal and emergency operation. The field switch is also under the control of protective relays on the generator, as is explained later in connection with protection. Sectionalization of the reserve excitation supply cable at several points was also resorted to for confining trouble on these circuits. As a further precautionary measure spare armatures for all direct-connected exciters are carried in stock.

RELAYS AND OTHER GENERATOR PROTECTIVE DEVICES

All generators are equipped with balanced relays of the modified Merz-Price type. The system of connections used is shown in Fig. 4. The relays are placed in the switch-house basement on concrete piers so constructed as to preclude any possibility of the relays

being operated by vibration. In addition to this the relays are inclosed in locked cabinets. The engineers of the company have recognized that, while the relays are very desirable equipment, they are delicate and must be treated accordingly. The operation of the relays is somewhat unusual in that they not only "clear" the machine from the system but also cut off excitation, and in the cases of units No. 5 and No. 6, which have external fans, also cut off the ventilation.

When the relays are tripped they perform the following functions in the order mentioned: First, open main generator oil switches; second, open generator field switch and generator neutral switch, the time element being obtained by auxiliary control contacts on the generator oil switches; and third (in the case of units No. 5 and No. 6), cut off energy supply to the motors driving ventilating fans. This sequence of operations was selected to minimize the rush of current into the generator which would occur if the field switch were to open at the same time as the first oil switch. It was thought advisable to provide for stopping the ventilation in order to reduce damage from fire.

Among the other interesting devices installed on the generators are exploring coils connected to pyrometers in the operating gallery. Temperature coils which operate on the same principle as the exploring coils are also installed in the air intakes of the machines. By means of these coils the temperature of air entering the machines can also be read in the operating gallery. These coils are of value in checking the operation of the air washers, of which enough are now installed at the plant to supply about 500,000 cu. ft. (14,000 cu. m.) of pure air per minute.

In the air ducts of units No. 5 and No. 6 an additional precaution against operating without ventilation has been taken. It consists of a small pivoted vane hung in the air duct. As long as air is being forced through the duct the vane is held in an approximately horizontal position. Should the air supply fail, the vane drops to a vertical position and gives an audible alarm in the operating gallery and a visible signal in the turbine room.

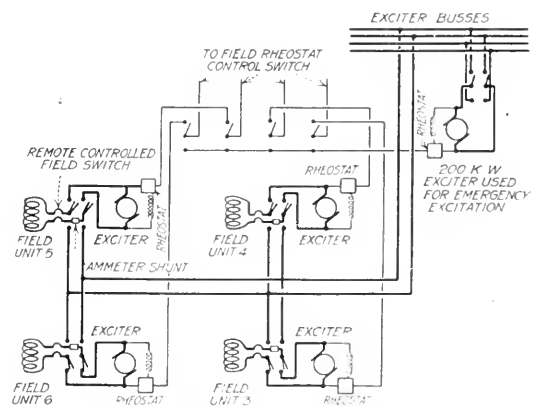

FIG. 3—DOUBLE-THROW SWITCHES PERMIT CONTROL OF RESERVE EXCITER FROM NORMAL FIELD-CONTROL SWITCHES

Plans have been made for a future installation of a three pole oil switch in the neutral leads of each generator. Under present conditions these leads are tied together and joined with a single-pole oil switch. A three-pole switch installed in this connection would assist considerably in speedily clearing trouble which may occur on any one or several phases of the generator.

The switching equipment for these generators and transmission lines is installed in the portion of the switch house which was built later than the original section. This portion differs from the original layout only in that it provides a basement for cables. The first floor contains high-tension buses and bus compartments. The second floor houses the oil switches and "disconnects" and the third floor the oil-switch mechanisms. Since the company's rules require that the transmission lines shall be grounded through oil switches, a special device has been worked out for this

purpose. It consists of a copper rod screwed to the work of the oil switch and connected at its upper end to a ground bus through a flexible conductor. Other features of the switch house are the testing cabinets installed on the second floor for each unit and the signal-lamp system energized by potential transformers on each transmission line to show operators which lines are alive.

This article will be concluded in a later issue.

WATER-POWER PROGRESS IN NEW ENGLAND STATES

The Relation Between Steam Relay Plant and Hydroelectric Development Is Analyzed by President of Turners Falls Company

An interesting analysis of the relation between steam relay plant capacity and hydroelectric development was recently presented before the Massachusetts Gas and Electric Light Commission by Philip Cabot of Boston, president of the Turners Falls Power & Electric Company. In connection with the issue of additional securities since authorized by the commission, Mr. Cabot was asked to explain some of the broader economic considerations bearing upon the construction of the new Hampden steam plant of the Turners Falls company and incidentally to set forth the underlying conditions governing the development of the Connecticut River. Closely related to the company's program of plant construction is the problem of supplying power to the Springfield Street Railway.

The Hampden steam station at Chicopee, Mass., at the junction of the Chicopee and Connecticut Rivers, is now rapidly approaching completion for its initial service. The first unit, of 15,000 kw. rating, is due for delivery in May, 1918, and a second unit of the same size is due for delivery at the end of this year. The estimated cost of the station with one 15,000-kw. unit installed, as at first contemplated, was about \$1,500,000. With two units installed the estimated cost is \$2,250,000. The ultimate capacity is 60,000 kw. and as much of the work has been done for the

Turners Falls is 60,000 hp. and that a reasonable part, say one-fourth, of the possible storage on the Connecticut River is provided in some way, Mr. Cabot said that roughly 40,000 hp. of relay would have to be maintained against that water power. The water power will provide 75 or 80 per cent of the annual kilowatt-hours taken out of the development, the steam plant being about two-thirds the size of the hydroelectric plant and providing not more than one-fifth of the kilowatt-hours. Mr. Cabot said that because of the increased price of coal it is probable that the development at Turners Falls can be made somewhat larger than was originally planned. Regarding stream conservation, he said that exhaustive study of the possibilities indicates that it is very difficult, perhaps impossible, and in his judgment unwise, for conservation

HAMPDEN STEAM PLANT AT TURNERS FALLS

on a large scale to be undertaken by private interests.

Mr. Cabot said that there is no possibility of providing in the watershed of the Connecticut River enough storage to make the flow of the stream permanent. Some relay would be necessary even if the power existed to-day and the money were at hand to store all the water which can be stored in the watershed.

The Turners Falls company spent about three years in negotiating with the Springfield Street Railway for the power contract now in vogue. As the negotiations proceeded it became clear that if the railway company was to make a contract it would have to be made for the entire supply of energy and that the investment of the railway in its generating station would have to be eliminated in some way. The Margaret Street station in Springfield is a direct-current steam plant of about 12,000 hp. rating and has little value for operating purposes in connection with a hydroelectric system like that of the Turners Falls company. It is expected that the Market Street and Westfield plants will be dismantled as the Turners Falls company takes on the railroad load. These plants have been purchased by the Turners Falls company.

The Springfield Street Railway has signed a twenty-year power contract with the Turners Falls company, and at present three 1500 kw. motor-generator sets are providing the local service required from Margaret Street as a distributing center, the incoming line pressure being 66,000 volts at the outdoor substation adjoining the motor-generator and operating room.

HYDROELECTRIC PLANT OF TURNERS FALLS COMPANY

nal development, including intake and headworks, much of the foundations and a great part of the underground work and coal handling system, the unit cost of plant for the first two machines is considerably higher than the probable unit cost of the whole station.

Assuming that the hydroelectric development at

Central-Station February Operations

CENTRAL-STATION INCOME AND OUTPUT GAIN IN PER CENT BY MONTHS FOR NATION

STATISTICS of revenue and output in February show that the central stations experienced in that month about the same retarding influences which they felt in January. Companies reporting to the ELECTRICAL WORLD, representing 52 per cent of the industry, had an increase of 9.6 per cent in the revenue from sales and of 7.1 per cent in kilowatt-hour output as compared with February, 1917.

In other words, the rate of increase in energy produced and in the revenue therefrom continued at a lower level during the second month of the year. It is encouraging that increase was maintained notwithstanding the various factors which operated to reduce production at that time.

Some of these factors were temporary, others must be accepted so long as the war lasts. Changes in requirements of customers, according as they are engaged in essential or "less essential" production, will have to be anticipated. Coal shortage must be reckoned with. The industry-closing order of Fuel Administrator Garfield is not generally accepted as a precedent to be repeated, but while the nation is at war any remote contingency may become a fact without warning.

It is interesting to see that in February as in January the rate of increase in revenue was maintained better than the rate of increase in output, showing that the

curtailment in consumption was mostly from the heavy power users. While the underlying conditions are unusually complex, it is probable that rate increases entered into the ultimate result of larger gain in revenue than in output.

TABLE I—CENTRAL-STATION RETURNS FOR TWELVE-MONTH PERIOD

Month	Percentage of Industry Represented	REVENUE FROM THE SALE OF ENERGY		Per Cent Increase	Kw.-Hr. OUTPUT		
		1917	1916		1917	1916	Per Cent Increase
March.....	64	23,919,070	20,913,000	14.6	1,409,129,000	1,139,453,000	23.6

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

ASCERTAINING BOILER-ROOM INSTRUMENT PRACTICE

Central-Station Company Contemplating the Purchase of Measuring Equipment Needed to Effect Economies Distributes Questionnaires

Contemplating the purchase of a complete quota of boiler-room instruments and the establishment of a bonus system for firemen, one Middle Western operating company mailed questionnaires to nearby plants of similar size with the idea of finding out what its neighbors were doing. Of the eight companies reporting seven have boiler-flow meters and seven have CO₂ apparatus. These companies produce 10,000,000 kw.-hr. to 67,000,000 kw.-hr. annually. Five of the seven recognize that the installation of these instruments has permitted them to effect economies. All eight companies have draft gages, six of the eight have water meters, and seven have recording thermometers on the feed water. Three use coal scales of some sort, and a like number depend on the mine weights or number of car loads for records.

Some sort of bonus system for boiler-room employees is used by only three out of the eight. One of these was certain that the bonus system effected economies in operation. From the information contained in this questionnaire and from a study of its own conditions the company decided to install a more adequate complement of boiler-room instruments.

IDLE GENERATOR IS USED TO IMPROVE POWER FACTOR

Connected with Load End of Transmission Line by Parallel Reserve Circuit and Operated as Synchronous Condenser

It is not unusual to connect a synchronous machine to some part of a circuit to improve the power factor, but a company in New England has found a method of doing this which utilizes any generators which may be idle. This is made possible by the fact that it has duplicate transmission lines running from its main generating station, only one of which is ordinarily required to carry the load. The other circuit is provided for emergency use and also to take care of future increases in load. When the power factor gets low the duplicate lines are paralleled at their distant ends, and any generator that may not be carrying load is connected to the reserve line. It is then allowed to run as a synchronous motor, being excited enough to compensate for the low power factor at the delivery end of the line.

A slight load can be put on the generator if necessary to secure the desired wattless current by allowing some water to flow through the waterwheel.

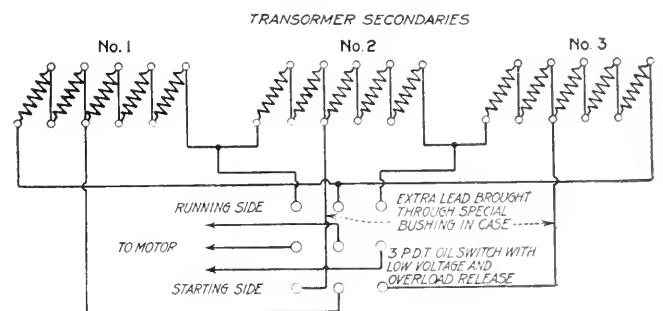

This arrangement, besides utilizing equipment that

would otherwise be idle, improves the power factor in both the line and the generators carrying load, whereas if it was merely floated on the bus as a synchronous condenser it would not benefit the line. By so doing it is also possible during a sleet storm to circulate enough current through the reserve line to melt any sleet which may adhere to the conductors.

TRANSFORMER CONNECTIONS ELIMINATING AUTO-STARTERS

Can Be Easily Arranged to Give 53, 60 or 72 per Cent Normal Voltage, Depending on Starting Torque Necessary

Where transformers arranged for three-wire secondaries are connected in delta for service to three-phase motors the neutral points may be connected to one side of a double-throw switch to provide half voltage for starting. This scheme is one which has been

CONNECTIONS FOR OBTAINING DIFFERENT STARTING VOLTAGES WITH VECTOR RELATIONS

much used in the past and should never be overlooked in emergency cases.

A modification of this system may be readily applied where transformers having 2300/460-volt secondaries are in use to furnish low voltage for starting 2300-volt motors. In such transformers only two secondary leads are available, and it is necessary to run an extra lead out of the case. If connections are made as shown in the upper part of the accompanying illustration, 53 per cent of full voltage can be procured for starting. This will ordinarily afford good starting torque without an excessive rush of current.

This connection was recently used successfully in operating a 350-hp. motor from three 100-kva. transformers after the auto-starter had burned out. The

double-throw oil switch was equipped with low-voltage and overload release. If this voltage is insufficient, 60 per cent or 72 per cent normal voltage may be obtained by tapping, as shown by the vector diagrams at the bottom of the illustration.

CONSOLIDATION OF TWO CENTRAL-STATION SYSTEMS

Conditions in Memphis Were Unfavorable for Unification, but It Was Accomplished with the Apparatus at Hand Without Interrupting Service

When the Merchants' Power Company and the Consolidated Memphis Gas & Electric Company of Memphis, Tenn., were taken under one management the engineering department was confronted with the problem of connecting two dissimilar systems in the most effective manner. The first-mentioned company furnished most of the energy to the underground business district, and the latter supplied the remainder and the overhead residence section. The Merchants' plant was equipped with 4000-volt generators that were connected directly to the business district by means of seven four-wire overhead cables. The Consolidated plant supplied 2300-volt electric service to the transformer primaries in the business district through fourteen single-phase, two-conductor feeders in separate ducts.

When the cut-over was made the Merchants' plant was shut down and its service was supplied from the 2300-4000-volt transformers at the Consolidated power house. The fourteen two-conductor cables were reconnected to serve as six four-wire feeders for the 4000-volt system. The cables were originally designed fifteen years ago for 4000 volts, but had been used at only 2300 volts up to the time of the change-over.

As the cables became heavily loaded during the peak hours, additional feeder capacity was necessary for emergency purposes. Fortunately a municipal electrical pumping station supplied by two 6600-volt cables was situated near the old Merchants' plant though fed from the Consolidated plant. In it were three 667-kva., 4000-6600-volt transformers through which energy could be supplied from the Merchants' plant in case of accident to the Consolidated station. An auxiliary line was therefore run from the 6600-volt cable to the Merchants' plant, where arrangements were made to step down the potential to 4000 volts and to feed back to the business district by means of the old 4000-volt feeders from the Merchants' plant.

This method of unification permitted the cut-over to be made without the purchase of new equipment, permitted the two dissimilar generating systems to feed the same cut-overs without changing the secondaries and provided workable emergency operating conditions. The coal consumption per kilowatt-hour of the Merchants' plant was about twice that of the Consolidated, and therefore considerable economy was effected when the latter assumed the load. The main difficulty in unification was the changing from two-wire to four-wire circuits. It was found that a four-wire system in two cables had doubled the reactance of a single four-wire feeder in one duct. Under the conditions existing at the time—high price of equipment, poor deliveries, etc.—however, this trouble had to be overlooked.

SPECIAL CLAMPS PERMIT THE SECTIONALIZATION OF LINE

With Tools Adapted Particularly to This Purpose the Clamps Can Be Connected or Disconnected While the Line Is Energized

By dead-ending its lines at points where it may be desirable to sectionalize them in case of trouble and by connecting these sections with jumpers and special conductor clamps, a Southern electric-service company has made it easy to isolate the sections at any time. These clamps, which are of the Johnson type, are constructed so that they may be connected or disconnected safely (see ELECTRICAL WORLD, Vol. 57, page 1346)

CONDUCTOR CLAMPS CAN BE REMOVED TO SECTIONALIZE LINE

while the line is energized with the use of a simple device on the end of a switch hook. Thus the expense of higher-priced disconnecting devices is avoided. The installation illustrated is on a 13,200-volt line.

NAMING PACKAGE QUANTITIES IN ORDERING COPPER WIRE

Class of Service for Which the Wire Is to Be Used Should Determine Whether It Shall Be Ordered in Reels or Coils

In placing orders for overhead copper conductors it is necessary to determine whether shipment should be made in coils or reels. This is especially true on large orders or where a specific character of construction is in view. Manufacturers' standard package quantities differ considerably, and often reductions may be made in construction costs by specifying packages suitable for the work in hand.

For large jobs reels are to be preferred. The greater length of the pieces minimizes splicing and permits pulling longer sections at a time. Furthermore, the wire can be easily run off the reels clean and is free from kinks. Large crews are usually available on such work, so no difficulty should be experienced in handling the heavy reels. The reels may be mounted on cable-reel jacks, on reel wagons or on trucks specially equipped for wire pulling.

On the other hand, wire which is to be used on a multitude of small installations should be ordered in coils to expedite the issuance of supplies and handling by small crews in the field.

One company having these requirements in view specifies packages as follows:

No. 8 weatherproof, 75 per cent in 50-lb. coils, 25 per cent in 100-lb. coils.

No. 6 weatherproof, 50 per cent in 125-lb. coils, 50 per cent in 250-lb. coils.

No. 4 weatherproof, 250-lb. to 300-lb. coils.

No. 2 weatherproof, 600-lb. to 800-lb. reels.

Nos. 1 and 1/0 weatherproof, 1000-lb. to 1200-lb. reels.

Nos. 2/0 and 4/0 weatherproof, 1500-lb. to 1800-lb. reels.

Nos. 6 to 2 bare, 1000-lb. reels.

Nos. 1 to 2/0 bare, 1500-lb. reels.

No. 8 weatherproof wire, being used exclusively for services, is ordered in small packages so that it may be issued directly to service wagons without cutting or re-reeling. No. 6 weatherproof conductor is used for short secondary extensions, series circuits and other light work and is therefore ordered in small and medium coils suitable for such work. No. 4 is also used in moderate lengths, but the lighter coils are found unnecessary. The larger sizes are generally employed only on more extensive jobs and are therefore ordered exclusively on reels. The same is true of bare wire in all sizes. This, being used only on high-voltage distribution systems or transmission lines, is invariably ordered on large reels.

USING MATERIAL CATALOGS FOR INVENTORY PURPOSES

Assist Inspectors Who Are Not Familiar with Equipment and Are Also Useful for Other Purposes

In making inventories of overhead distribution systems difficulties are experienced in securing inspectors sufficiently familiar with line construction materials to list them correctly in detail. One company recently engaged in making a complete inventory for use in a rate hearing before a state public service commission provided its inspectors with illustrated catalogs showing in detail line hardware and appliances with ap-

PHOTOGRAPHS OF EQUIPMENT AID INSPECTORS MAKING INVENTORIES

propriate names and style numbers. A group cut from one of these catalogs is reproduced. A number of such sheets were provided, showing respectively cross-arms, bolts and braces, clamps, pins, brackets, anchors, strain insulators, grounding devices, cut-outs, lightning arresters, pin-type insulators, disconnecting switches, mast arms, lamp reels and hangers, time switches and dead-ends. The smaller devices were shown grouped in single photographs; the larger ones required separate sheets for each style.

It was found that photographs were cheaper to prepare than diagrammatic sketches, besides which they were more easily identified in the field. After the inventory was completed the booklets were found of service to inspectors checking completed work and to

line foremen ordering material from the storeroom. Such a catalog will in fact be found useful for any central-station employee engaged in the purchase, handling or utilization of line materials.

HIGH-GRADE COAL FIRED DURING PERIOD OF PEAK

Emergency Measure Is Also Utilized to Good Advantage During Plant Construction When Boiler Deliveries Are Slow

Influx of war industries coupled with slow deliveries of equipment made the problem of carrying last winter's peak a difficult one for the Moline plant of the Moline-Rock Island Manufacturing Company, which supplies electric service to the "Tri-Cities," Davenport, Rock Island and Moline. Boiler capacity appeared to be the limiting factor. In order, therefore, to obtain the maximum rating out of the existing equipment only high-grade coal was burned during peak hours. Under ordinary conditions Iowa coal was burned.

Getting the high-grade fuel on the fires at the critical time was the chief problem. The difficulty was surmounted by constructing auxiliary bunkers for the high-grade southern Illinois coal. They were constructed of wood and were set almost against the fronts of the 500-hp. boilers in an elevated position so that they could be emptied into the stoker hoppers during peak loads by operating a metal-bound wooden gate. The clearance between these bunkers and the boiler fronts was just sufficient to afford ventilation and to give space for operating levers. The auxiliary bunker in front of each 500-hp. boiler holds 3 tons of coal. Coal was delivered to these auxiliary hoppers by the same machinery that conveyed coal to the overhead bunker that holds the supply of ordinary coal. When the high-grade coal had to be distributed chutes were arranged under the conveyor so that the coal would be dumped into the auxiliary bunkers instead of the main bunker. With underfeed stokers it was possible to get as much as 300 per cent of rating out of the boilers with this arrangement, but with the chain-grate stokers 175 per cent of boiler rating was about the limit that could be obtained.

At the Fort Dodge (Iowa) Gas & Electric Company, which is under the same management as the Davenport company, the same idea was utilized in a different way and for a different purpose. In constructing the plant permanent arrangements were made to fire two kinds of coal in order to reduce the investment which would otherwise be necessary for additional steaming equipment. The boiler plant at Fort Dodge consists of 500-hp. boilers with a sectionalized 17-ton bunker divided into two equal parts. One part is for Iowa coal and one is for southern Illinois coal. Duplicate spouts are provided to each stoker hopper. During the peak, or at times when transmission line failure places extra load on the plant, it is possible to get at least 20 per cent increase in rating over the best that can be obtained with Iowa coal. It may be possible to get even better performance. The great saving in this instance comes, however, from the saving of investment in one entire boiler equipment, which would amount to around \$22,000.

Light, Power and Heat

INNOVATION IN ADVERTISING ON CUSTOMERS' STATEMENTS

Washington Company Gives Discount Coupon Besides a Different Cooking Recipe Each Month to Be Pasted in a Scrapbook

An interesting innovation has been introduced by the Potomac Electric & Power Company of Washington, D. C., by the addition of a special advertising and discount coupon to its monthly service bills. The Potomac company's bill is printed in four sections, the bill proper carrying the amount and detail of the charge with a cashier's "tear-off" coupon at the right which is to be returned with the check. At the left of the bill, however, is a special advertising panel featuring at the top an attractive picture lithographed in many colors and illustrating a nursery rhyme which appears beneath it. Below this is an advertisement of some appliance which is being advocated particularly that month; at the bottom of the coupon is a notice to the effect that the holder of this coupon is entitled to a special 10 per cent discount on all cash purchases of appliances made during that month, while on the reverse of this coupon is printed a cooking recipe. At the left of this advertising panel is a "tear-off" for the collector which is sent to the collection department when the bill is rendered, in case the account stands in arrears.

This bill, which is reproduced here, is exceedingly attractive in appearance. The entire form is lithographed, and the advertising panel, being in bright

recipes which will have a value for the housewife and a little file of illustrated nursery rhymes which will appeal to the children, but also a little file of pictures and descriptions of electrical household appliances which will have an advertising influence of some permanence.

FIG. 2—SCRAPBOOK GIVEN TO CUSTOMERS

The offer of the 10 per cent discount to the holder of the coupon is expected to bring a large number of people into the company's salesroom to purchase appliances. This will give an opportunity to present the scrapbook

MAY 10, 1918		THIS BILL IS RENDERED NET AND SHOULD BE PAID ON OR BEFORE MAY 10, 1918. IF NOT PAID BY SAID DATE AN ADDITIONAL CHARGE OF 10 PER CENT OF THE AMOUNT OF THE BILL WILL BE ADDED.

FIG. 1—SERVICE BILL OF WASHINGTON (D. C.) COMPANY, SHOWING COUPONS

colors, is assured of a reading. The plan goes further, however, as is announced on this particular bill. The company has prepared a "Nursery Rhyme and War Recipe" scrapbook which will be given to any customer for the purpose of pasting up and saving these rhymes and recipes. The result will be not only a little file of

and paste in the first rhyme and recipe, which will insure the distribution of a very large number of books.

J. C. McLaughlin, commercial manager of the company, says: "We figure that the additional cost of adding this advertising panel to our bills is exceedingly profitable when we realize that for \$1,800 more it will

distribute during the year over 500,000 advertisements, each one a direct appeal for business with an appealing, human-interest feature. More than \$64,000 worth of appliances were sold out of the company's display room last year, and we are confident that this new system will greatly increase our sales through 1918. Our appliances all carry a 50 per cent profit. This allows us ample margin for the 10 per cent discount offered to the coupon holders, which of course covers cash purchases only. This particular bill, being the first of the series and announcing the plan, does not exactly follow out the form of display which will be standardized hereafter, the 'ad' being on the back."

Another interesting feature of this bill form is a list on the back of thirty-seven banks and trust companies to which the bill may be paid by arrangement with the power company if such payment is more convenient for the consumer.

REDUCING THE DELINQUENT ACCOUNT BY 80 PER CENT

Central Station Obtains Excellent Results in Twelve-Month Period by Building Up Collection Organization

In one year the Muncie (Ind.) Electric Light Company reduced its delinquency account from \$12,591.98 to \$2,225.51, or more than 80 per cent. This was done, says C. L. Walling in the *Bulletin* of the American Gas & Electric Company, the parent organization, first, by creating the office of manager of collections; second, by insisting upon a deposit with each contract; third, by never closing the books on a bad account, and, fourth, by keeping continually after the old offenders and educating them to pay their bills promptly. The

rowed for a few days and a big drive on delinquents is made by the collection department.

Delinquent letters are sent out as soon after the tenth as possible to every delinquent account, and the delinquent list is kept up to the minute.

HANDLING MOTOR AND WIRING ORDER CREDITS

Short Sketch of Office Routine by Large Middle Western Lighting Utility in Matters of This Nature

In taking care of credit matters on orders for motors or for wiring the practice of one of the large central stations of the Middle West is as follows:

If applicant for motor or wiring is a consumer, both his service and mercantile accounts are scanned and if habit of pay is good the order is approved. If payment is slow or the customer's account would not justify the amount or terms of the order, the customer is so notified and payment in full or in part, as the case may be, is requested in advance.

Should the applicant not be a consumer, his rating, if any, is looked up, his references are investigated, and if found satisfactory the order is passed. If investigation proves otherwise, applicant is notified and advance requested, and a copy of such notice is filed seven days ahead, which, if not acted on, is removed from the file and a second or follow-up letter is written, a copy of which is also held seven days, at which time the con-

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Windings for Polyphase Motors.—T. SCHUTTER.—Rules for making half-coil and whole-coil windings are given and slot spacing and winding details are embodied in this article, which is illustrated by several drawings.—*New York Electrical Engineering*, April, 1918.

Winding Troubles of Direct-Current Machines.—GORDON FOX.—Methods of locating and temporarily repairing faults of armature and field coil windings are described.—*Railway Electrical Engineer*, April, 1918.

Elementary Principles of Continuous-Current Armature Winding.—F. M. DENTON.—Armature windings are classified as closed-coil and open-coil windings and further subdivided into ring, drum, lap, wave and series parallel windings, single and double re-entrant duplex and multiplex ring windings, and simplex and multiplex wave windings. The different types of windings are illustrated.—*London Electrician*, March 29, 1918.

Economy of Electric Drive in Cane Sugar Mills.—C. A. KELSEY.—Economic advantages that result from adopting electric drive are discussed with respect to labor, supplies, repairs, production, water supply, illumination and traction. The general as well as the specific advantages of electric drive are analyzed, particular attention being given to the direct-current motor-driven centrifugal pumps.—*General Electric Review*, April, 1918.

Essentials of Transformer Practice, Section 11.—E. T. REED.—The author points out that the amount of insulation to be used in a given space often depends upon its mechanical properties and the stresses which it must withstand in winding as well as on other electrical properties involved. Among other subjects discussed are the dielectric characteristics of transformer insulation, curves being presented to show temperature effect, etc.—*Electric Journal*, April, 1918.

Mechanical Design and Specification of Turbo-Alternator Rotors.—S. F. BARCLAY.—Methods of providing for adequate ventilation, the design of end-bells, the relative merits of solid and laminated types of rotor, the maximum diameter permissible, factors that should determine the steel used, the design of the shaft and the effect of alternating stresses are among the subjects discussed in this, the last of the author's articles on this subject.—*London Electrician*, March 29, 1918.

Lamps and Lighting

Importance of Correct Lighting in the Shop.—A. L. POWELL.—The factors that influence the amount of light and the equipment necessary to fulfill certain requirements are discussed in this article.—*Railway Electrical Engineer*, April, 1918.

Report on Automobile Headlamps.—Road illumination, the intensity, distribution and direction of light required, the optical principles of headlighting features required in a practical headlamp, safety limitations and

the minimum illumination and minimum spread permissible are among the subjects discussed in this report, which includes data and charts.—*Report of Committee on Automobile Headlights*, I. E. S. Council.

Generation, Transmission and Distribution

Russian Water-Power Legislation.—Statistics show that the water-power reserve in Russia is approximately 30,000,000 hp., of which only about 1,000,000 hp. has been utilized. Turbine installations utilize about one-quarter of this amount. Lack of special legislation and the existence of stringent rulings are given as the reasons for this lack of development.—Abstracted from a Petrograd journal by the *London Electrical Review*, Feb. 22, 1918.

Recent Advances in Transmission Construction.—L. M. KLAUBER.—The article deals with improved methods of installing transformers, conductors, splices, spans, poles, cross-arms, braces, insulators, ground guards and dead-end clamps and refers to the latest tendencies as to wire arrangement, clearances and grounding. Embodied in the article is a sag table suitable for stringing conductors. The article is illustrated by several instructive diagrams.—*Journal of Electricity*, March 15, 1918.

Relief of Fuel Consumption.—J. M. ROBERTSON.—The complete and efficient utilization of Canadian resources, including transportation and fuel, as well as the reduction of fuel consumption, by the increased use of hydroelectric energy, are discussed.—*Canadian Engineer*, March 28, 1918.

Power-Plant Losses.—R. J. C. WOOD.—The interconnection of power lines has resulted in economies being effected. A detailed survey of the saving possible in the power plant itself, as well as an analysis of the larger problems, is given in the article.—*Journal of Electricity*, April 1, 1918.

Transmission and Distribution Losses.—R. E. CUNNINGHAM.—War conditions necessitate that electric service be stimulated rather than diminished. The elimination of losses along economic lines is of paramount importance and is dealt with in this article.—*Journal of Electricity*, April 1, 1918.

Power Resources in Southern California.—H. A. BARRE.—The increase of war demand for economical output was met by the power companies of southern California by the interconnection of the hydraulic resources.—*Journal of Electricity*, April 1, 1918.

Installations, Systems and Appliances

Canadian Pumping Stations.—G. KUHN.—Description of a number of interesting pumping stations installed in Canadian cities. Three of the installations are electric (Port Arthur, Kitchener and Deseronto). The author explains how the problems of speed regulation and water regulation for ordinary and emergency

demands are solved to the satisfaction of these cities.
Schweizerische Bauzeitung, Feb. 9, 1918.

Power-Factor Improvement in a Large Central Station.—F. SCOUMANNE.—An extended study of the actual application of methods of improving power factor previously outlined by the author to the networks of the company at Baku of which he is director. The main divisions of the subject cover the character of the installations and choice of the system; the consequence of raising the power factor and how far it is advantageous; data on interest charges, amortization, price per kilowatt-hour, value of existing installations, and the optimum charge of aerial lines; choice of the centers of production of reactive current, and an elaborate valuation of the economy effected thereby in operating turbo-generators, substations, aerial lines, network, transformers, etc. The determination of the reactive current necessary, the employment of synchronous motors and the use of static condensers are also discussed. The conclusions arrived at are: (1) The improvement of the power factor in the case under study afforded a considerable advantage; (2) on the bases accepted for price, rate of amortization, cost of repairs and production of energy by existing equipment, the static condenser is superior to the synchronous condenser; (3) the optimum value of the power factor is approximately $\cos \Phi = 0.90$, whatever type of condenser is employed. It is better to keep slightly within this value than to go beyond it.—*Revue Générale de l'Electricité*, Feb. 23, 1918.

Tres Sargentos Electric Substation, Buenos Aires.—An unusual feature in this substation is the replacement of reserve batteries by a Diesel-engine-driven generator plant. The article describes the substation in detail.—*London Engineering*, March 22, 1918.

Tendency Toward Outdoor Switching Apparatus.—H. G. MACDONALD.—It is pointed out that only recently has it been possible to make large power transformers with all their controlling and protected apparatus so that they can be installed outdoors without protection from the weather. Pressures set up within oil-switch housings by automatic operation under severe overloads must have means of relief, and provision must be made for the escape of gas volatilized from the oil during the summer. If the apparatus is used in cold climates, the oil must be prevented from solidifying. Adequate provision must also be made to protect the mechanism from accumulations of snow and ice. The apparatus must have more mechanical strength than indoor apparatus because severe internal pressures have to be withstood. The insulation of exposed parts must be protected against collection of dirt and moisture and snow. Methods of supporting the switches, providing for inspection, protecting the bushings and operating mechanism are also described.—*Electric Journal*, April, 1918.

Wires, Wiring and Conduits

Iron and Steel Conductors.—R. C. POWELL.—The scarcity of copper owing to war conditions has led to the use of iron and steel wherever the substitution is possible. The application of these metals as conductors has created a new situation and problems for the power expert to solve. The situation is analyzed in this article.—*Journal of Electricity*, April 1, 1918.

Electrophysics and Magnetism

Some Applications of Electromagnetic Theory of Matter.—ALBERT C. CREHORE.—The theory of radiation and the atomic structure was principally interpreted from the Rutherford-Bohr theory of the atom. The fundamental hypothesis of atomic structures as composed of electrons, positive and negative, may be considered to be correct. Planck's quantum theory of radiation, the Rutherford-Bohr theory, the electromagnetic theory, rings of electrons, electrons ejected from atoms with high velocity, X-ray spectra, ionizing voltages, theory of crystal structure, atoms at a great distance, the number of electrons per atom, the order of magnitude of the orbits of the electrons in the atoms and several other interesting phases of the subject are set forth in this article.—*Proceedings A. I. E. E.*, April, 1918.

Improvement of Power Factor.—W. C. RECHNIEWSKI.—Different methods employed to raise the power factor are discussed. The chief of these are: (1) The employment of high-tension or low-tension static condensers. These have not given practical results because of their fragility, difficulty of regulation, high price, etc. (2) The employment of phase advancers. (3) The employment of over-excited synchronous motors placed in the installations or at particular points of the network to furnish current to the surrounding motors—a plan widely adopted and facilitated by specially constructed motors. The author considers over-excited synchronous motors in two aspects—as producers of wattless current and as producers of motive power. In the first aspect he holds that in the great majority of cases they will pay for themselves in two or three years by the economies realized; from the second point of view they afford the maximum of economy wherever they can be employed. A practical example is worked out to support these conclusions.—*Revue Générale de l'Electricité*, March 9, 1918.

Electrochemistry and Batteries

Methods and Plant for Battery Charging.—F. AYTON.—Different methods of charging lead-plate and nickel-iron alkaline batteries are described and the advantages and disadvantages of a reducing booster plant are discussed. The author concludes by saying that in spite of the higher efficiency and lower cost of the reducing booster it will generally be found, where pressure reduction is required on a scale which justifies the employment of a rotary transforming machine, that the motor-generator is the most satisfactory type to use.—*Electric Vehicle*, March, 1918.

Battery-Charging Equipment of Southern Pacific.—Economies were effected by using a motor-generator set to reduce the generated voltage to a value suitable for charging storage batteries and by employing resistors only to make small adjustments in the voltage. The method of doing this is described and illustrated.—*Railway Electrical Engineer*, April, 1918.

Units, Measurements and Instruments

Experimental Study of Periodical Movements.—A. POUCHOLLE.—Description of an interesting apparatus due to the ingenuity of M. Gueugnon and consisting of an Atwood machine modified for the production and recording of periodical movements, the graphical records lending themselves to precise quantitative measurement.

It will facilitate the comprehension of alternating currents in less advanced schools where the lack of mathematical knowledge makes it necessary to proceed experimentally.—*Revue Générale de l'Electricité*, March 16, 1918.

Chart for Calculating the Resistance of Parallel Conductors.—A. CASTEX.—The chart, based on the method of M. d'Ocagne, provides a convenient means to the end mentioned.—*Revue Générale de l'Electricité*, March 23, 1918.

Telegraphy, Telephony and Signals

Limitations of a Telephone Receiver.—The telephone receiver as a detector for very feeble alternating currents in both wireless telegraphy and wireless telephony is discussed.—*Telegraph Engineer*, April, 1918.

Postal Company's Generator Wiring Arrangement.—A method is illustrated and described for wiring three motor-generators to operate duplexes and quadruplexes.—*Telegraph and Telephone Age*, April 1, 1918.

Simultaneous Telegraph and Telephone Communications.—WILLIAM MAVER, JR.—This article relates to the use of the Van Rysselberthe method of transmitting telegraph messages over metallic telephone circuits without impairing the telephone service. Several wiring diagrams are shown indicating the key system and use of gradulators. By this system the emission and extinction of the telegraphic current is rendered gradual, thereby permitting the transmission of telegraphic and telephonic messages over the same line or lines simultaneously by means of a combination of electromagnets and condensers from the gradulators by the inventor.—*Telegraph and Telephone Age*, April 16, 1918.

Technical Problems of Radio-Communication.—LÉON SOUTHILLON.—A paper on the application of the Austin-Cohen formula to the determination of the characteristics of sending and receiving radio stations in the calculation of rating, desirable wave length and sending distance. The author arrives at a formula which affords a simple solution of these problems.—*Revue Générale de l'Electricité*, March 23, 1918.

Miscellaneous

Bonus for Power-Plant Employees.—WARREN B. LEWIS.—The author outlines a basis for a bonus system, discussing stand-by losses.—*Power*, March 26, 1918.

Automobile Electric Kitchen.—ANSON S. RICE.—A mobile and entirely self-contained electric kitchen is described. The capabilities of the outfit are demonstrated by results of tests made at the direction of government officials.—*General Electric Review*, April, 1918.

Combustion Characteristics of Coals.—JOSEPH G. VORKER.—Four factors determine the selection of stoker equipment—load conditions, available coal, draft conditions and application conditions. The nature of the load and the amount of coal to be burned by the apparatus are the most important. This is true because different types of stokers can burn the same kind of coal, but each type is limited in the overload rating that can be successfully maintained. The performance data of various stokers burning buckwheat and anthracite coal, Eastern bituminous coal, Pittsburgh coal, low-grade Illinois coal, Illinois and Carterville mixed, lig-

nite, etc., are given. The effect of mixing various percentages of anthracite coal with the ordinary coal used is given in dollars and cents.—*Electric Journal*, April, 1918.

Low-Temperature Industrial Heating.—DWIGHT D. MILLER.—The relative advantages of different types of electric furnaces, their operation and control and the advantages that accrue by the use of electrical energy for production of high temperatures are discussed in this article, which is concluded from the March issue.—*Ohio Electric Light Association Monthly*, April, 1918.

Substitute for Cedar Poles.—L. M. KLAUBER.—War demands on lumber have caused a scarcity of cedar poles. As a result substitutes have been resorted to, the best available substitute on the Pacific coast being Douglas fir, usually termed Oregon pine. Availability, cost, strength and durability are factors to be considered in selecting substitutes, the author points out. A treating plant for fir poles is described.—*Journal of Electricity*, April 15, 1918.

Report of Sub-Committee on Insulation Deterioration.—J. A. KOONTZ.—It is pointed out that the best method of bringing out defects in cap and stud insulators is to subject them to several temperature cycles and test them at suitable intervals for failure due to the formation of cracks in the caps by spark-over voltage. The article includes two tables embodying insulator test data.—*Journal of Electricity*, April 15, 1918.

Possibilities of Reducing Fuel Consumption by the Adoption of Electrical Heating.—P. H. MITCHELL.—The author points out the relative amounts of heat which can be produced for one cent with various fuels and electricity at different prices as follows:

	B.t.u.
Anthracite at \$8 per ton.....	18,000
Anthracite at \$10 per ton.....	14,300
Bituminous coal at \$3.50 per ton.....	48,000
Bituminous coal at \$7 per ton.....	24,000
Peat at \$4 per ton.....	21,000
Fuel oil at 0.07 cent per gal.....	15,500
Fuel oil at 0.14 cent per gal.....	7,750
Electricity at 0.01 cent per kw.-hr.....	3,413
Electricity at 0.008 cent per kw.-hr.....	4,240

From this he concludes that electric heating is feasible at \$12 per horsepower, but that it is not yet an economic possibility, due to high cost and lack of available power. Electric power rates would have to be one-quarter of the present rates for electric heating to compete with heating by anthracite coal. Many millions of horsepower would be required to meet even present requirements. For example, 2,000,000 hp. would have to be available to heat Toronto's dwellings and other buildings, or 4 hp. per capita. When millions of horsepower in Canada are developed and power at \$12 is available, a large electric heating load may be established. This, of course, does not mean that every portion of the country could be served, but the great bulk of the population would be within zones of distribution and it might thus be in large degree substituted for coal and other fuels. It may be that the economic use of fuel and water-power resources will demand that fuels shall be reserved for heating purposes and that the hydroelectric power available will be substituted to the maximum for all mechanical, railroad and metallurgical operations. By arranging to maintain a continuous heating load electric heating may be given a positively economic status.—*Canadian Electrical News*, April 15, 1918.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

ELECTROCHEMISTS INSPECT PLANTS IN THE SOUTH

Members and Guests of the American Electrochemical Society Are Making Extensive Tour—
F. J. Tone Elected President

One hundred and twenty-five members and guests of the American Electrochemical Society left Washington on Sunday evening, April 28, for a week's trip through the Appalachians south to inspect the electrochemical and metallurgical industries of that region, as well as to study its mineral resources and possibilities of hydroelectric development. The society is traveling by special train chartered with the approval of Director-General McAdoo.

The first stop was at Johnson City, Tenn., on Monday, as breakfast guests of the Chamber of Commerce. Later in the day, at Kingsport, the varied industries of that city were opened to the visitors, who saw the manufacture of cement dyes, explosives, alcohol, paper pulp and tanning extract. The local committee entertained the party at luncheon at Rotherwood Farm. A complimentary banquet in the evening was followed by the annual business meeting, at which the election of officers for the ensuing year was announced as follows:

President, F. J. Tone of the Carborundum Company of Niagara Falls; vice-presidents, Acheson Smith, H. W. Gillett and R. Turnbull; managers, C. F. Burgess, E. L. Crosby and C. G. Schluederberg; treasurer, H. G. Salom; secretary, J. W. Richards.

Tuesday, April 30, was spent in the Knoxville district, with the first stop at Mascot to visit the ore concentration and flotation plant of the American Zinc Company. Later the Knoxville Board of Commerce provided a special train to take the party to the new hydroelectric development of the Aluminum Company of America at Cheoah and Alcoa. At each of these points a 200-ft. (60.9-m.) dam and power house are under construction as the first two units of a complete development of about 400,000 hp. A brief technical session was held in the afternoon at the University of Tennessee.

In the evening a banquet was tendered the visitors, after which President Fink made his presidential address on electrochemistry and national economy. Mr. Schluederberg spoke on the part the United States industries must play to enable the Allies to win the war. Prof. J. A. Switzer of the University of Tennessee gave a report of a preliminary survey of possible water powers in eastern Tennessee. He showed a total possible development of 750,000 hp. at twenty-one sites.

Wednesday, May 1, was spent at Chattanooga and vicinity, visiting plants of the Southern Ferro Alloys Company and the Chattanooga Gas & Coal Products Company. A special trip was made by boat to the Tennessee Power Company's development at Hales Bar. In the evening the society was tendered a dinner at

Signalman Inn, which was followed by a short technical session. The rest of the week will be devoted to districts in the vicinity of Muscle Shoals, Birmingham and Anniston, Ala.

SPRING MEETING OF THE CONFERENCE CLUB

National Labor Policy, Government Attitude Toward
Contractors and Functional Reorganization of
the Industry Discussed at Asheville

The spring meeting of the Conference Club, at Asheville, N. C., on April 25, 26 and 27, was of particular importance for two reasons: Sullivan W. Jones, secretary of the Conference Club, and its representative in Washington, was appointed to represent the National Association of Electrical Contractors and Dealers for the purpose of placing before the government the right claimed by the electrical contracting industry to serve the government in connection with its war construction work. A Conference Club plan for the functional reorganization of the electrical industry was announced.

The regular sessions of the Conference Club were preceded by a meeting of the advisory board of the National Association of Electrical Contractors and Dealers. All of the members of the advisory board are also members of the Conference Club. L. K. Comstock, chairman of the Conference Club, is also chairman of the advisory board. William Creighton Peet, chairman of the national association, outlined the intended function of the advisory board. Mr. Peet's statement was followed by a general discussion of the Washington situation as it relates to government construction work and the employment of the electrical contractor, and also a discussion of the labor problem.

The chairman was authorized to discuss with Mr. McNulty, grand president of the International Brotherhood of Electrical Workers, the possibility of formulating a national labor policy. Back of this authorization was the view, expressed by many of those present, that the labor problem was of the utmost importance to the industry; that the mistake had been made in the past of regarding it as local and intermittent instead of nation-wide and continuous. Organized labor had come to stay, and the time had likewise come to think of the labor question in terms of the future, to look at it down a vista of years, and to formulate a constructive policy acceptable to both employer and employed. It was felt that such a policy need not necessarily be the answer to the sporadic issues arising, but one which would ultimately so alter conditions of employment and relations between the employer and his employees as to provide for the future industrial peace and the maximum of benefits to both.

With respect to the situation on government con-

struction, the discussion developed the consensus of opinion that the electrical contracting industry was at present in a critical position, largely brought about by the government's failure to require general contractors to follow their normal practice of sub-contracting the mechanical and specialized trades. The government's failure in this connection had a very important bearing upon the future of the electrical contracting industry. If the government continued to permit general contractors to create and educate, at the government's expense, branches of their organizations to execute these trades, the electrical contractor might, after the war, find it necessary to go into general contracting to secure his legitimate work. The conclusion was that the work of the secretary in Washington was vital and must be continued. It was pointed out, however, that while he was directing his efforts toward the employment by the government of the whole electrical contracting industry, he represented only the Conference Club. It was decided that in carrying on his work the secretary ought to represent the entire electrical contracting industry.

At the first session of the Conference Club a resolution was introduced and unanimously carried authorizing the advisory board to offer to the national association the services of Mr. Jones as its Washington representative. The offer was accepted by Mr. Peet under authority already vested in him.

The proposed functional reorganization of the electrical industry was presented in a paper in the preparation of which a number of Conference Club members collaborated. After reviewing the defects in the present system for distributing the manufacturers' products and the conflicts between the engineering functions performed by the manufacturer, the contractor and the consulting electrical engineer, the paper proposed a readjustment providing for an orderly sequence of mutually complementary engineering functions in connection with the production, distribution and utilization of the industry products. The proposed plan was summarized as follows:

1. That the manufacturer change and ultimately abandon his practice of selling direct to the ultimate consumer, and abandon also his policy of making such sales on the basis of expert engineering advice given by his representative.

2. That the consulting engineer organize to increase the scope of his practice to include rendering expert services to those large consumers of electrical products who heretofore have been thus served by the manufacturer; that he establish with all manufacturers such relations that he may familiarize himself with their products and standards, advise with them on the improvement of their product, and function as the coordinator of their several departments, and that he cease to function as his client's agent in the purchase of apparatus and supplies.

3. That the electrical contractor reorganize, and annex to his organization engineering talent of a high order, so that he may become a constructing engineer with sufficient capital to act as his own jobber; that he assume much of the consulting engineer's detail work, abandon very largely his independence as a purchaser of the manufacturer's product, and effect with the manufacturer some sort of close working contact based upon a liberal policy providing for reciprocal benefits.

OLIVER HEAVISIDE MADE

A. I. E. E. HONORARY MEMBER

Board of Directors Votes to Confer Honor Upon English Mathematician and Physicist for Eminent Services to Science

At a recent meeting of the board of directors of the American Institute of Electrical Engineers in New York Oliver Heaviside, mathematician and physicist, fellow of the Royal Society of London, was elected an honorary member. The vote was unanimous.

This action accorded with the procedure prescribed in the constitution to govern the election of honorary members. It followed the presentation to the board of a proposal in writing, signed by ten prominent members.

In recognition of the eminent services rendered by Heaviside to the scientific world the directors adopted the following resolution:

Whereas, Oliver Heaviside has rendered service of the highest value in the advancement of electrical science, leading to practical results of a far-reaching order, and notably in the development of electromagnetic theory; and

Whereas, The constitution of the American Institute of Electrical Engineers provides that by unanimous vote of all the members of the board of directors honorary members may be chosen from among those who have rendered acknowledged eminent services to electrical engineering or to its allied sciences; it is

Resolved, That Oliver Heaviside, Fellow Royal Society, London, England, be elected, in recognition of his contributions to electrical science and engineering, to honorary membership in the American Institute of Electrical Engineers.

Oliver Heaviside, now made an honorary member of the A. I. E. E., is, as stated, a fellow of the Royal Society of London. He is an honorary member of the Literary and Philosophical Society of Manchester, a member of the American Academy of Arts and Sciences and an honorary member of the Institution of Electrical Engineers. The University of Göttingen, Germany, conferred the honorary degree of Doctor of Philosophy upon him. The home of Mr. Heaviside is at Homefield, Lower Warberry, Torquay, England.

SHORTAGE OF COAL IS

THREATENED NEXT WINTER

National Coal Association Issues Public Statement that Unless Railroad Traffic Is Readjusted Soon Serious Conditions Will Arise

Another coal shortage, more serious than that of last winter, and almost certain interference with the war program are inevitable throughout the East, in the opinion of bituminous coal operators in the chief producing sections of the country, unless there is a readjustment soon of traffic over Eastern railroads. This is stated in a statement made by the National Coal Association. The enormous demands of other war industries are crowding coal off the rails, and the resultant continued shortage of cars at the mines has cut production to the danger point.

WILLIAM D. WEAVER TO BE HONORED BY A. I. E. E. TABLET

Directors of American Institute of Electrical Engineers Accept Petition of Group of Members to Record Appreciation of His Services

A bronze tablet in honor of William D. Weaver of Charlottesville, Va., former editor of the *ELECTRICAL WORLD*, is to be placed in the room of the board of directors of the American Institute of Electrical Engineers.

A communication to the president and directors of the Institute, presented at the meeting of the board on April 12, follows:

The undersigned members and fellows respectfully submit to the president and the board of directors of the American Institute of Electrical Engineers a petition asking for the acceptance of a permanent record in the form of a bronze tablet, to be placed in the room of the board of directors, in honor of Lieut. William Dixon Weaver, volunteer chief engineer, United States Navy.

The signatories have selected this year since it is twenty years ago that Mr. Weaver, laying aside his work and private duties, re-entered, as volunteer chief engineer, the United States Navy at a moment of the nation's need.

The contemporaries of Mr. Weaver need no explanation of the reason why the signatories desire to do him honor and why they deem the rooms of the Institute the proper place for such record. We have, however, to remember the younger generation.

He was born at Greensburg, Pa., Aug. 30, 1857. He was graduated in 1880 from the United States Naval Academy at Annapolis, studying at the Sorbonne and in London. In 1883 he went on the first Greely relief expedition. He founded the *American Electrician*, and he was editor of the *ELECTRICAL WORLD* from 1893 to 1912. He re-entered the United States Navy as volunteer chief engineer in 1898. In 1900 he was appointed by the United States government as the official delegate to the International Electrical Congress at Paris, but, upon his suggestion, the appointment was transferred to Dr. Kennelly, who had taken a more active part in the congress work. In 1904 he was treasurer and business manager of the International Electrical Congress at St. Louis.

He was twice a director of the Institute, and from 1901 to 1906 chairman of its library committee. In 1915 he was selected by the board of directors as one of the Institute's representatives on the Naval Consulting Board, but he declined on account of his health.

The Engineering Societies Building owes its existence to the munificence of Mr. Carnegie. At the Institute library dinner in 1903, which Mr. Carnegie attended as guest of honor, Dr. Billings, then perhaps the greatest authority of the world on library administration and organization; Theodore De Vinne, our greatest printer, and R. R. Bowker, who had the leading part in introducing the card catalog, were the principal speakers. In their remarks they referred to the desirability of proper quarters for the great collection of books gathered by the American Institute of Electrical Engineers. Mr. Weaver prepared and submitted to Mr. Carnegie a proposition under which Mr. Carnegie was to donate an amount for the purpose of "housing" the library. Mr. Weaver wished to make this library a great library of reference on electrical, physical, engineering and technical subjects generally, having complete files of important publications, notably the proceedings of the French Academy (donated by C. O. Mailloux) and the proceedings of the Royal Society (donated by E. D. Adams). The library is Mr. Weaver's silent monument.

"But for his extremely retiring disposition," said the *ELECTRICAL WORLD* of May 4, 1912, "he would long since have been clothed with the highest honors which it is within the power of the profession as a whole to bestow. . . . The career of Mr. Weaver is notable . . . also by reason of many other highly important results attained in his characteristic manner, without widespread public knowledge of his work therefor, but always with the assurance on his

part that no credit was withheld from all others assisting in the work."

The signatories recognize in him the highest type of an American, engineer, scholar, journalist and patriot, and they desire to dedicate to this Institute, in recognition, always so modestly veiled by him, of his services in the promotion of the welfare of the Institute and the engineering profession; of his untiring assistance and aid to men he deemed able and promising; of the creation of a journalistic forum in which independent opinions could be voiced by all; in rendering those columns familiar to great English, French and other European writers; in having been instrumental, jointly with others, in securing a permanent home for the engineering societies, and in building up the Institute's library and rendering it serviceable to the membership; in organizing and carrying to a successful conclusion the work of the International Electrical Congress at St. Louis and the Commission on Resuscitation from Electric Shock.

We conclude this brief memoir by citing the words of our honorary secretary, Ralph W. Pope:

"The most prominent feature, and which is a matter of record, is his building up of our great engineering library, which was practically accomplished by his exertions, guided by a most remarkable knowledge of engineering literature and his devotion to the highest ideals in the ever-growing field of electrical science."

In response to this petition the board of directors unanimously adopted the following resolution:

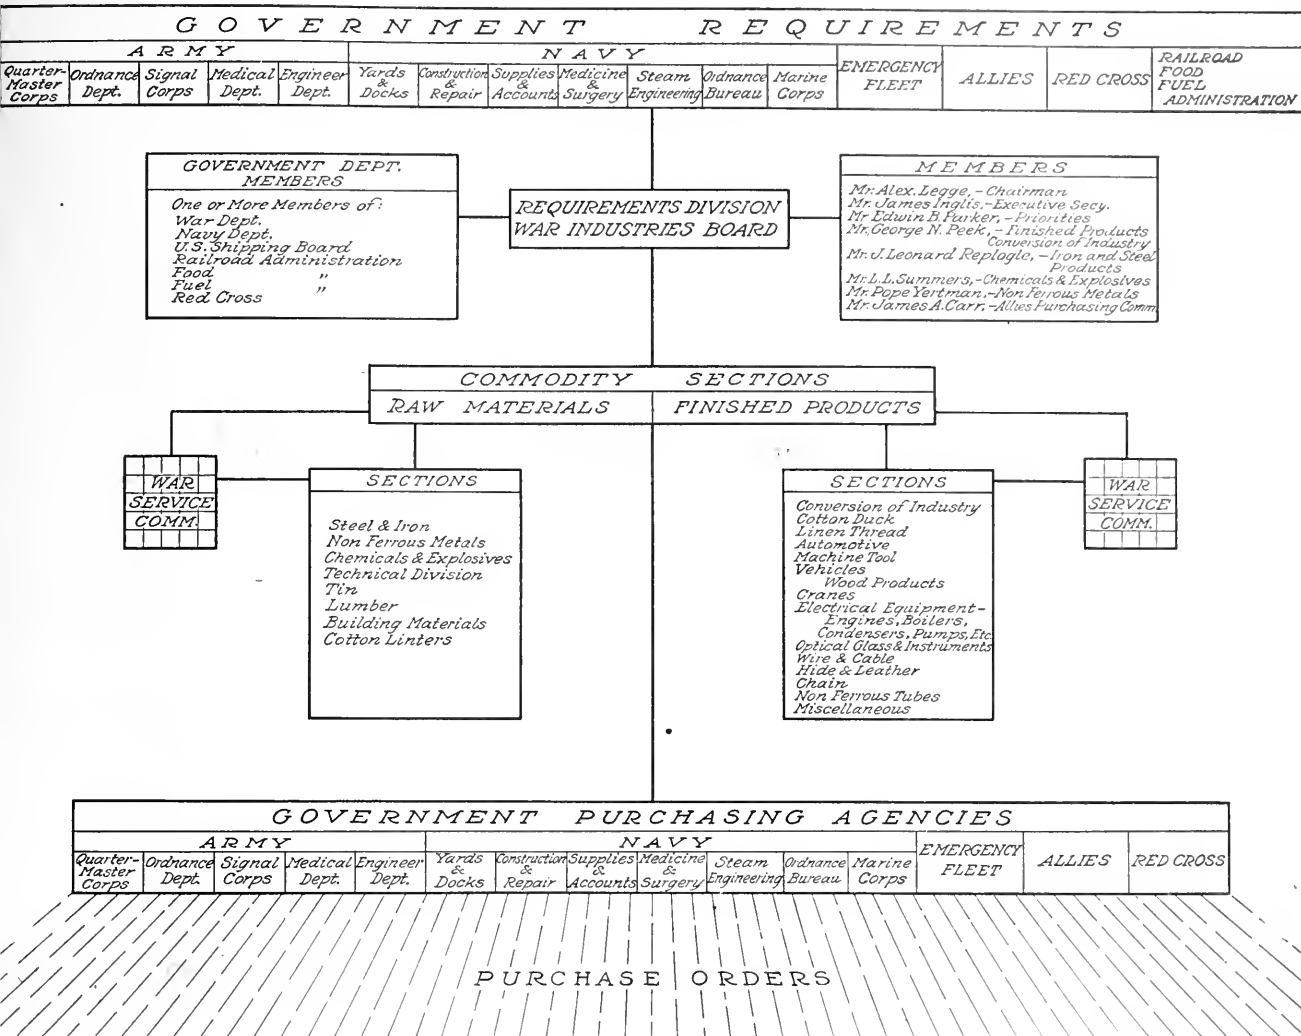

Whereas, A group of members of the Institute has presented a petition to this board offering to donate to the Institute a bronze tablet for the purpose of recording appreciation of the services rendered to the Institute and the electrical engineering profession by William D. Weaver; and

Whereas, Mr. Weaver has been an active member of the Institute for over thirty years and has ably served the Institute in various capacities, including several years as chairman of the library committee and six years as a member of the board of directors; be it

Resolved, That the American Institute of Electrical Engineers hereby accepts the offer referred to above, and that the president be authorized to appoint a committee of three to confer with representatives of the petitioners, this committee to have power to complete the arrangements to carry out the intent of this resolution.

Red Cross Mission Includes Engineers

The American National Red Cross announces that a commission of about sixty, including a number of engineers from the United States, will study existing conditions in Palestine. The commission, with the exception of a few members, is believed to have arrived in Palestine. The following electrical engineers are in the party: Arthur A. Bacon, Hobart College, Geneva, N. Y., and Julius A. Brown, Fayerweather Hall, Columbia University, New York.

In order to acquire a knowledge of the government's requirements as far in advance as possible this division has been formed, and the various departments of the government and the Allies' Purchasing Commission bring their requirements to it as soon as they are known. These re-

quirements are passed from the requirements division directly to the commodity sections interested in the particular requirements. The diagram was exhibited by George N. Peek at the recent Chicago meeting of the United States Chamber of Commerce.

ENGINEERING COUNCIL ACTS ON INDUSTRIAL EFFICIENCY

Special Committee on Industrial Affairs Drafts Resolution to Urge Retention of Bonus Method of Stimulating Production

The Engineering Council has appointed a special committee on industrial affairs as follows: Prof. George C. Swain, Massachusetts Institute of Technology, chairman; E. W. Rice, Jr., president General Electric Company; Charles T. Main, president American Society of Mechanical Engineers; Alexander C. Humphreys, president Stevens Institute of Technology and Buffalo Gas Company, and Benjamin B. Thayer, vice-president Anaconda Copper Mining Company. The committee has drafted a resolution which was adopted at once by special action of the Engineering Council.

In the preamble of the resolution it is stated that Congress has under consideration in the navy and army appropriation bills proposals to prohibit, diminish and condemn the payment to public employees or to employees of private establishments under government

control of any cash reward, premium or bonus for superior service. In the opinion of the Engineering Council these methods, if applied with due regard to wages, surroundings, health and safety of the employee, will increase efficiency and production, help win the war and preserve our institutions. It is vital to the winning of the war, the Engineering Council holds, that no legislation or other measure should be adopted which may interfere with highest efficiency and maximum production; on the contrary, every proper means should be taken to increase efficiency and production.

Upon the subject matter of the resolutions presented on April 18 by F. P. Fish, chairman of the National Industrial Conference Board, the special committee is now concentrating its attention and making a careful investigation. This board has requested the engineering societies of the United States "to investigate and to publicly express themselves as to whether or not we are losing or gaining in industrial efficiency, and to state what causes, if any, in their opinion are influencing the condition, and in what manner broadly they believe our industrial efficiency can be stimulated."

The A. I. E. E. Members in Service

A framed poster hanging on the wall of the offices of the American Institute of Electrical Engineers, New York, tells the present total.

EDISON MEDAL AWARDED

TO COL. JOHN J. CARTY

Presentation of Eighth Edison Medal for Colonel Carty's Work in Science and Art of Telephone Engineering to Be on May 17

The eighth Edison medal has been awarded by the Edison medal committee of the American Institute of Electrical Engineers to Col. John Joseph Carty for his work in the science and art of telephone engineering.

The medal will be presented to Colonel Carty at the annual meeting of the Institute to be held in the auditorium of the Engineering Societies Building, New York, Friday, May 17, at 8.30 p. m. President E. W. Rice, Jr., will preside and the program will be as follows: Address by A. E. Kennelly outlining the origin and purpose of the Edison medal; address by Michael I. Pupin giving history of Colonel Carty's work in regard to telephone engineering; presentation of medal to Colonel Carty by President E. W. Rice, Jr.; acceptance of the medal by Colonel Carty.

As is generally known, the Edison medal was established upon the initiative of a group of friends and associates of Thomas A. Edison for the purpose of recounting and celebrating the achievements of a quarter of a century in the art of electric lighting with which the name of Edison is imperishably identified. It was decided that the most effective means of accomplishing this object would be by the establishment of a gold medal which should, during the centuries to come, serve as an honorable incentive to scientists, engineers

and artisans to maintain by their works a high standard of accomplishment.

Therefore the Edison medal was established and endowed with a trust fund, under an indenture dated Feb. 11, 1904, whereby the American Institute of Electrical Engineers agreed to award the medal annually. The medal is awarded each year, by a committee consisting of twenty-four members of the Institute, to a resident of the United States of America and its dependencies or of the Dominion of Canada, "for meritorious achievement in electrical science or electrical engineering or the electrical arts."

POWER CONTRACT TERMS

MADE IN PASADENA, CAL.

Agreement, Subject to Approval of State Railroad Commission, Arranged Between City and Southern California Edison Company

After lengthy negotiations between the Southern California Edison Company and the city of Pasadena, an agreement has finally been reached which is satisfactory to both, and essentially along the lines of elimination of duplicate investment and conservation of fuel resources. The agreement is subject to the approval of the Railroad Commission of California, and a joint application was made to the commission by the city and the Edison company at a hearing held in Los Angeles on April 25. The following are the principal points covered by the agreement:

The city of Pasadena agrees to lease the electric distributing system of the Edison company in Pasadena, the stipulated value of which is \$513,102.11, for a period of two years, the city to pay a rental for said property equal to 8 per cent per annum and also to pay rental for the use of every extension made to the company's distributing system in Pasadena at the same rate. In addition, the city agrees to pay to the company an amount equal to 3.36 per cent of the value of the company's distributing system on account of depreciation, the money so paid to go into a depreciation reserve fund, which will be handled according to a special provision in the agreement.

The city is to have an option to purchase the company's distributing system in Pasadena at the price stipulated plus cost of additions thereto at the end of the two-year period. If the war still continues at the end of two years, then the lease may be extended under the same terms and conditions until the end of the war and for four months thereafter.

The city agrees to purchase from the company at all times during the term of the lease such electrical energy as it may require, and at the termination of the lease, provided that the city acquires the company's distributing system, to continue purchasing all its electrical energy from the company until April 15, 1933.

The schedule for energy supplied by the company to the city is to be: For the first 250,000 kw.-hr. furnished during each month, 0.95 cent per kilowatt-hour; for the next 500,000 kw.-hr. furnished during each month, 0.90 cent per kilowatt-hour; for all over 750,000 kw.-hr. furnished during each month, 0.75 cent per kilowatt-hour.

The city is to have the right, upon giving thirty days' notice, to take service upon an annual load-factor basis;

the load factor being figured upon an average of the three highest peaks in a year, no two peaks being in any one month. The load-factor schedule is:

	Cents per Kw.-hr.
less than 44 per cent load factor.....	0.875
less than 46 per cent but not less than 44 per cent.	0.85
less than 48 per cent but not less than 46 per cent.	0.84
less than 50 per cent but not less than 48 per cent.	0.82
less than 52 per cent but not less than 50 per cent.	0.79
less than 54 per cent but not less than 52 per cent.	0.77
fifty-four per cent and over.....	0.75

The steam plant of the city, with a rating of 6000 h.p., which now supplies electrical energy to the city's distributing system, shall be maintained by the city and kept in condition for operation, but shall be operated only upon the order of the company or when and during the time the service of the company to the city shall be interrupted and the operation of the plant reasonably necessary. Whenever the plant shall be operated the company is to pay all costs incident to putting in operation and maintaining it during the period required, including interest and depreciation at the rate of 12 per cent per annum for said period on the depreciated value of the plant as carried upon the books of the city.

During the period of the lease the provisions of the agreement will be carried out under the supervision of "operating board," to consist of the manager of the city's electric department and a representative of the company.

The city agrees to lease and sell to the Edison company certain distribution lines belonging to the city outside the limits of Pasadena under the same terms and conditions as the Edison company's lines in Pasadena shall be leased or sold to the city, and further agrees to confine its electric distributing business in future to the territory within the corporate limits of Pasadena, to certain specified existing consumers outside the city accepted.

During the term of the lease all additions and new business secured by the city shall be attached to and become a part of the respective systems of the city and the company in such manner and quantity that the new business and extensions measured in income shall be distributed that the present proportion of business between the company and the city shall be at all times substantially maintained. The distribution of such extensions and new business shall be subject to the operating board. The present proportion between the city's business and the company's business is determined 56 to 44.

The testimony submitted at the hearing before the commission indicated that Pasadena could make great economies in operation by the consolidation of the Edison company's Pasadena business with that of the city. No rate reductions were promised by the city in the near future. The Edison company will be a gainer by the agreement in that it will earn 8 per cent on its capital investment instead of less than 5 per cent under existing conditions, and that it will supply a total of over 12,000,000 kw.-hr. annually to the territory within the city, instead of approximately 5,000,000 kw.-hr. at present.

Since December, 1917, the city of Los Angeles has been supplying Pasadena with some electrical energy, this being surplus energy from the aqueduct plant over and above that required by Los Angeles under its con-

tract with the Edison company. At the hearing before the Railroad Commission in reference to the joint application of the city of Pasadena and the Edison company, the city attorney of Los Angeles entered a protest against the discontinuance of power service to Pasadena by Los Angeles which would follow the approval of the joint application made by Pasadena and the Southern California Edison Company. The existing contract between Los Angeles and Pasadena for surplus electrical energy contains a provision that it may be abrogated upon thirty days' notice by either. According to the attorney for Los Angeles, the protest was made along the lines of patriotic conservation. He stated that Los Angeles did not desire to embarrass Pasadena in the matter of its agreement with the Edison company, but that if the power service of Los Angeles city to Pasadena were discontinued, the Edison company would have to supply an equal amount of energy generated by steam. This statement was not allowed to go unchallenged by representatives of the Edison company.

PROBLEMS OF WAR BEFORE OKLAHOMA ASSOCIATION

Meeting of 200 at Oklahoma City Marked by Seriousness and Patriotic Consideration of War-Time Questions

The seventh annual convention of the Oklahoma Gas, Electric and Street Railway Association was held in Oklahoma City on April 22, 23 and 24. About 200 utility representatives were in attendance. The convention was marked by an attitude of seriousness not noted in previous conventions. The utility members seemed to feel that the present conditions called for co-operative work, for patriotic willingness to share their portion of the war burdens and for an entire revision of the past methods in dealing with the public. The association at this convention accomplished more in the way of reaching a solution of the larger utility questions than at any convention in the previous history of the association.

The first session met on Monday afternoon. Mayor Overholser of Oklahoma City made an address of welcome, and F. D. Shaffer, manager of the Chickasha Gas & Electric Company, gave his presidential address, the keynote of which was co-operation on the part of the utilities of the State to relieve the present financial stringency and effectually prosecute the war.

C. W. Shannon read a paper on "The Reliability of the Oklahoma Oil and Gas Fields." Mr. Shannon predicted that in the near future it would be possible to predetermine the life of Oklahoma oil and gas wells. The convention then adjourned to inspect the new waterworks project built for the supply of Oklahoma City at a cost of \$1,500,000.

At the Tuesday morning session L. E. Mohrhardt read a paper on the use of electricity in the oil and gas fields of the State. Discussion brought out the point that the load obtainable in the oil and gas fields would be advantageous to central-station men from every standpoint, but that there had been no attempt to get this load. One of the difficulties is the necessity for costly equipment and high-tension lines. Mr. Barnes of the Westinghouse Electric & Manufacturing

Marching for the Third Liberty Loan in New York City

Executives and employees of the New York Edison Company, the United Electric Light & Power Company and

affiliated companies turned out for the Liberty Day parade, April 26, swelling the numbers and adding to the enthusiasm.

Company said that the oil-well supply firms have volunteered to carry a stock of electrical apparatus, thereby lowering the capital investment of the central stations.

After hearing the papers of Guy B. Treat, chief engineer of the Oklahoma Railways Company, and Prof. L. W. W. Morrow of the University of Oklahoma, the convention went on record in support of the National Committee on Public Utility Conditions appointed by the National Electric Light Association, the American Gas Institute, the National Commercial Gas Association and the American Electric Railway Association. It passed a resolution to the effect that the Oklahoma sub-committee of the national committee be empowered to engage a high-grade man to handle the work of the associations in Oklahoma in connection with the granting of rate increases, the obtaining of financial aid from the War Finance Corporation and the obtaining of proper publicity for the utilities in the State, and in other ways to advance the interests and promote the welfare of the individual members of the association.

In discussing the papers, the consensus of opinion was that a rate increase was the only solution of present financial problems, and that such an increase ought to be granted upon proper presentation of facts with a minimum delay.

At the afternoon session C. S. Thompson and J. W. Shartel discussed the advisability of concentrated production, transmission and distribution of electricity in Oklahoma through the use of a few large stations.

The discussion of the paper by L. A. White, entitled "Gas-Fired Boilers," dwelt on the fact that a large combustion chamber was the essential prerequisite for the efficient use of gas under boilers. Mr. Kretz of Okmulgee went so far as to advocate the Dutch oven method of combustion. Mr. Molinard of the Oklahoma Gas & Electric Company said that his company was now trying out the effect of large and small combustion

chambers on oil-fired boilers. The opinion prevailed that the use of gas for power production was a thing of the past and that every plant must necessarily be equipped with oil or coal for emergency conditions when the gas supply was low or completely failed.

At the Wednesday morning session the discussion following Charles Hoopes' talk was to the effect that the licensing of stationary engineers was advisable in Oklahoma, and a resolution favoring a law to this effect was passed.

In discussing Prof. F. F. Blachly's paper on "Utility Taxation" there was no agreement as to a proper method of taxation, but there was an entire agreement as to the advisability of an intensive study of the subject with a view to working out an equitable basis for Oklahoma.

At the afternoon session there was a thorough discussion on the relations of the utilities and the consumer. The idea advanced by A. L. Mitchell was that every utility should be represented in an association and at its meetings, and that the meetings of such an association afforded the only place for the utilities and the corporation commission to discuss informally the many utility problems. The opinion of the members was that commission regulation had come to stay and that so long as the standard of the Oklahoma commission membership was maintained there could be no more advisable method. J. C. Resler, city manager at Weatherford, advocated the placing of municipal plants under the jurisdiction of the corporation commission in order to enforce proper accounting methods.

J. F. Owens, vice president and general manager Oklahoma Gas & Electric Company, was elected president; C. S. Thompson, general manager Shawnee Gas & Electric Company, first vice-president; J. W. Shartel, vice-president and general manager Oklahoma Railways, vice-president, and L. W. W. Morrow, University of Oklahoma, secretary-treasurer.

Associations and Societies

The Directory of Electrical Associations, which is regularly printed in the first issue of each month, appears on page 963 of this number.

Duluth Engineers' Joint Meeting.—There will be a joint meeting of all the engineering societies in Duluth on May 6. General subjects will be discussed.

Institute of Radio Engineers.—"The Feasibility of Low Antennas in Radio Telegraphy" was the title of a paper presented by Prof. Edward Bennett of the University of Wisconsin before the Institute of Radio Engineers on May 1.

A. I. E. E., Panama Section.—On April 1, the Panama Section of the American Institute of Electrical Engineers held a meeting at Balboa Heights. E. A. Graham, electrical engineer, presented some general notes on methods used in public utility examinations.

National Fire Protection Association.—On May 7, 8 and 9 the National Fire Protection Association will hold its twenty-second annual meeting at Chicago in the auditorium of the Insurance Exchange Building. The report of the electrical committee will be given during the Tuesday morning session, which opens at 10 o'clock.

N. E. L. A., Southeastern Section.—The Southeastern Section of the National Electric Light Association will hold its annual convention on June 19 and 20 in Atlanta, Ga. The meeting will be a strictly war-time meeting and no provision will be made for entertainments. The titles of the papers and other details will be given later.

Syracuse Technology Club.—Prof. A. J. Acheson, consulting engineer of the Bureau of Gas and Electricity, presented some thoughts regarding street lighting in Syracuse, N. Y., before the Technology Club on April 22. He discussed several methods for lighting the town-districts in the town, methods for assessment for the special lighting and a new method of lighting residential districts.

A. S. C. E., San Francisco Section.—"What water-power development is to be fostered was the prediction of F. H. Fowler, United States Forestry Engineer, before the San Francisco Section of the American Society of Civil Engineers on April 16. "Demand for power in California has been increasing at a steady rate of about 30,000 kw. mean load annually," said Mr. Fowler, "and this means that there should be an annual installation of from 40,000 kw. to 50,000 kw. to carry the peak loads." He also stated that there was a shortage in development which could be attributed to two causes, first, the uncertainty concerning federal legislation, and second, the failure of rate-fixing bodies throughout the country to allow increases in rates as rapidly as the cost of production increased.

A. I. E. E., Spokane Section.—"Hydraulic Turbines—Their Design, Manufacture, Efficiency and Testing," was the subject of a paper by J. W. Hungeate, electrical superintendent Inland Empire Railway Company, C. F. Udhen, chief engineer Washington Water Power Company, and R. F. Daniels, engineer Washington Water Power Company, presented before the Spokane Section of the American Institute of Electrical Engineers on April 19.

A. E. R. A. Annual Convention.—The annual convention of the American Electric Railway Association and affiliated associations will be held at Atlantic City, N. J., this year during the second week in October. According to the tentative program so far prepared, the American association meeting will open on Tuesday afternoon, Oct. 8, and close on Wednesday afternoon. The affiliated associations will meet on Wednesday and Thursday mornings.

Boston Engineers.—The ninth annual dinner of the Boston Society of Civil Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers was held at the Boston City Club on April 30. W. H. Flood, Jr., of the American International Shipbuilding Corporation spoke on "The Greatest Shipyard in the World." Alfred D. Flynn, secretary of the Engineering Council, talked about the progress and changes of that body.

American Gear Manufacturers' Association.—The second annual meeting of the American Gear Manufacturers' Association was held April 18 to 20 at White Sulphur Springs, West Va. F. N. Sheppard of the United States Chamber of Commerce spoke at the opening session on "How We Can Get Behind the Government and Help Win the War." F. W. Sinram was elected president, and Frank D. Hamlin was chosen for secretary and treasurer. The next meeting of the association will be held in September, the time and place to be determined later.

Pacific Coast Joint Electrical Meeting.—The meeting of all of the electrical interests on the Pacific Coast will be held in Del Monte, Cal., as previously announced in the ELECTRICAL WORLD. The National Electric Supply Jobbers of the Pacific Coast will meet on Monday, May 6, the California Association of Electrical Contractors and Dealers will convene on Tuesday, and the delegates of the National Electric Light Association will arrive on Thursday. Some of the important papers to be presented are: "Possible Water-Power Development in California," by F. H. Fowler; "Joint Operation of Power Companies," by J. P. Jollyman; "Power-Plant Losses," by R. J. C. Wood; "Transmission and Distribution Losses," by R. E. Cunningham; "Iron and Steel Conductors," by R. C. Powell; "Standardization of Pin-Type Insulators," by L. M. Klauber and R. E. Cunningham; "Substitute for Cedar Poles," by L. M. Klauber, and "Insulator Deterioration," by J. A. Koontz. There will also be papers on commercial, accounting and contractors' problems.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Pole Maintenance.—Where the employee of a telephone company, in order to make certain repairs, climbed a telephone pole and sustained injuries as a result of the breaking of the pole beneath the surface of the ground on account of its decayed condition, which condition was not obvious or known to him, it being shown that it was not the duty of the employee under his contract of employment to make an independent inspection of the pole for the purpose of discovering hidden defects, the failure of the telephone company to use due care to maintain such pole in a reasonably safe condition for the purpose of such employment constitutes actionable negligence, the Supreme Court of Idaho held (170 P. 88).

Liability of Water-Power Company for Damages Caused by Dam on Navigable River.—The erection of a dam in the Tennessee River, backing water over lands adjacent to those occupied by plaintiff as tenant at will, was an appropriation for flowage purposes, all resulting damages from which were compensated by an award to the owner, plaintiff's landlord, the Supreme Court of Tennessee held in Chattanooga & Tennessee River Power Company vs. Lawson (201 S. W. 165). A private contractor building a dam to be deeded to the United States in a navigable stream under direction and according to specification of the United States is liable only to the same extent as the government, which is not liable for the consequential damages to a tenant at will of one who has been compensated for land taken by alternate overflow and recession of water, causing stagnation and breeding mosquitoes which infected plaintiff and his family with malaria. Such contractor, being liable only to the same extent as the government, it is not liable for the tort of failing to remove obstructions and rubbish after each overflow, since the United States is not liable for torts. Where a dam was erected for the United States in a navigable stream and alternate overflow and recession caused a stagnant pool on land of a private owner, the United States was not liable for failure to drain the pool, since it had no right to go upon private lands for such purpose. That a private contractor building a dam to be deeded to the United States in a navigable stream under direction and according to specifications of the United States retained an interest in the surplus water for power production did not render the contractor liable for merely consequential damages to residents of the vicinity by reason of creation of unhealthful conditions.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Government Wants Men for Export-Trade Offices.—The government is looking for men capable of taking charge of branch offices of the Bureau of Foreign and Domestic Commerce, Department of Commerce; also men to act as assistants in such offices. These branch offices are established in the principal commercial cities, the salaries ranging from \$1,800 to \$3,000 for managers and from \$1,200 to \$1,800 for assistants. Applicants should write at once to the Bureau of Foreign and Domestic Commerce at Washington, as a non-competitive examination will be held on May 16 in various parts of the country.

University of Pittsburgh Gives Radio Engineering Course.—A course in radio engineering for technical graduates will be given at the University of Pittsburgh, starting May 20 and lasting for eight weeks. This course will be open only to graduates in electrical or mechanical engineering who are recorded in class 1 of the National Army draft. Men enrolling in it will be placed by the government in class 5 until completion of the course, when they will be inducted into the Signal Corps and sent to an army school for further training. The need for men familiar with the technique of radio communication is great, and the chances for obtaining a commission ultimately are good. There will be no charge for tuition, but students must provide their own living and traveling expenses. As the number of men is limited, application should be made at once to Prof. H. E. Dyche, department of electrical engineering, University of Pittsburgh, Pittsburgh, Pa.

National War Labor Board.—The National War Labor Board, the outgrowth of the Commission of Employers and Workers, has mapped out a plan of organization. Frank P. Walsh of Kansas City and William H. Taft, who had been designated by the President as chairmen of the board, will preside alternately at all sessions. The board, as finally appointed by the President, consists of the same persons who formulated the national war labor program, but pending the return of William H. Johnson, president International Association of Machinists, now abroad upon a special mission, his place will be taken by T. J. Savage. The other members are: Loyall A. Osborne, vice-president Westinghouse Electric & Manufacturing Company; B. L. Worden, vice-president and general manager Submarine Boat Corporation; W. H. Van Dervoort, vice-president Root & Van Dervoort Engineering Company; L. F. Loree, president Delaware & Hudson Company, and C. E. Michael, president Virginia

Bridge & Iron Company, representatives of employers, and Frank J. Hayes, president United Mine Workers of America; William L. Hutcheson, president United Brotherhood of Carpenters and Joiners of America; Victor Olander, secretary Illinois State Federation of Labor, and T. A. Rickert, president United Garment Workers of America, representatives of employees.

Employment Management.—The first course of intensive training in employment management under government supervision has been opened at the University of Rochester. Twenty prospective employment managers, sent by manufacturers having war contracts, including especially shipbuilding plants and several departments at Washington, have begun six weeks' intensive training in the practice and theory of employment management. The course is given at the request and under the supervision of the industrial service sections of several departments at Washington. It will later be repeated in Boston, New York and elsewhere.

Dividends in Scrip.—American Public Utilities Company directors declared the regular quarterly preferred dividend due on April 1 in scrip, payable on or before April 1, 1923, with 6 per cent interest, payable semi-annually. The directors deemed it prudent to conserve the cash resources of the company and its subsidiaries. While not authorizing any unusual construction expenditures by subsidiary companies, at the same time the directors felt that they must provide for the constant demands for added service at existing plants, and as there is no certainty that funds for these unavoidable expenditures can be obtained through the sale of securities in the usual way, they must be taken from earnings ordinarily devoted to dividends.

Vail Expects Justice for Telephone Company.—In a statement at the annual meeting of shareholders of the American Telephone & Telegraph Company, Theodore N. Vail, the president, said: "The system must be increased as fast as demands of a growing country call for service and as fast as new services are discovered and introduced. Whenever our earnings are in excess of requirements, if they are not absorbed by improvements in service, they are invested in plant, which is not burdened with capital charges and which thus forms a safeguard against possible obsolescence on a large scale. These commitments make necessary readjustments in charges, and while we have had many reductions, we have been obliged to ask many rate increases. After a thorough presentation of our case, we have never been refused relief, with the possible exception of some negligible cases. We have been allowed many increases in rates in many cases the last year, and there are several very important cases closing in which we have had most favorable consideration and in which material increases are conceded. We feel confident that we shall continue to get ample justice and full consideration."

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Electric Extensions During the War.—The California Railroad Commission has authorized the Mount Whitney Power & Electric Company, which sells electricity in Tulare, Kern and Kings Counties, to put into force certain rules for extensions of electric service during the war. These rules obligate the company at its own expense to make all extensions in which the annual gross revenue equals a third of the cost. Where the annual gross revenue is less than the cost of the extension, but more than one-fifth, the company will give the service if the consumer advances the entire cost, which will be refunded to him on the basis of 20 per cent of the monthly bills. The consumer may at his own cost build enough of the extension so that the amount to be expended by the company shall not be more than three times the annual payment for service by the consumer. The Mount Whitney company is ordered to adjust all extensions made by it within one year prior to this order, if requested by the consumer.

Rate Relief in Wisconsin.—A decision of the Wisconsin Railroad Commission authorizing the Glidden Light, Power & Water Company to increase electric rates says in part: "There is bound to be more or less fluctuation in voltage with equipment such as that used at Glidden, but the commission does not believe that conditions at this time warrant the issuance of an order requiring the utility, in view of its finances and in view of the present high prices of apparatus, to go to the expense of installing auxiliary equipment so that absolutely uninterrupted service may be rendered. . . . It is evident that some adjustment of the rates is necessary to give the utility relief. . . . If the flat rate for business use as filed were strictly applied the increase would be greater. Inasmuch as the practice of supplying electric service to commercial users on a flat-rate basis, except under certain restricted circumstances, is contrary to the best accepted practice in electric plant operation, the commission has endeavored to eliminate such flat rates whenever possible. In the present case the finances of the utility do not warrant the purchase and installation of meters upon all flat-rate consumers at this time. We believe, however, that the flat rates should be increased and, further, that steps should be taken by the utility so that flat-rate users who desire to be metered may purchase the meters at cost from the utility, the latter to refund 50 cents monthly to each such consumer until the amount paid has been returned to him."

G. H. Smart, commercial manager of the Knoxville (Tenn.) Railway & Light Company, has resigned.

Ivy Carr has succeeded F. H. Miller, manager of the Crawfordsville (Ind.) Electric Light & Power Company.

George M. Patterson has been appointed manager for the Central Maine Power Company at Bucksport, Me.

William H. Fitzhugh, superintendent of the Bay City (Mich.) electric light department from November, 1885, to the present time, has resigned.

John D. Ryan, president of the Anaconda Copper Mining Company and of the Montana Power Company, has been appointed director of aircraft production for the army.

Dr. A. E. Kennelly, professor of electrical engineering at the Massachusetts Institute of Technology, has been appointed acting head of the electrical engineering department of the Institute during the absence of Professor Jackson, who has been commissioned a major.

Frank V. Burton has been appointed to the newly established position of general sales manager of the Bryant Electric Company of Bridgeport, Conn. He was educated in the public schools of Albany, N. Y., and in 1891, at the age of seventeen, in partnership with his brother, embarked in an electrical contracting business which continued about three years. He entered the electrical contracting firm of Berger, Rogers & Potter of Troy, N. Y., and in 1895 became connected with the Western Electric Company at New York, first in the construction department and later in the supply department, where he remained for more than six years. His short connection with the electrical engineering firm of Sanderson & Porter in New York followed, and in the sum-

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

W. W. Erwin has been appointed chief operating engineer of the New York Edison Company to succeed the late J. P. Sparrow. Mr. Erwin joined the

W. W. ERWIN

forces of the Edison company in October, 1900, as a mechanical draftsman. He was made chief draftsman in 1903 and superintendent of construction in 1906, which position he held until his appointment to the present one.

Lieut. William Sikes Tucker, formerly connected with the sales department of the Electric Storage Battery Company, Philadelphia, has been awarded the French war cross for bravery.

F. W. Lachicotte, Jr., manager of the Chester (S. C.) branch of the Southern Public Utilities Company, has been transferred to become superintendent of the electrical department of the Charlotte (N. C.) branch of the company.

Frank L. Fox, for the last four years manager of the Thomasville (S. C.) branch of the Southern Public Utilities Company, has been transferred to the managership of the Chester (N. C.) branch, succeeding F. W. Lachicotte, Jr.

W. W. Hanks, superintendent of the electrical department of the Charlotte (N. C.) branch of the Southern Public Utilities Company, has resigned to become associated with the Charlotte Electric Repair Company, in which he is interested.

H. W. King, superintendent of distribution for the East St. Louis Light & Power Company, has resigned that position to become associated with the Sangamo Electric Company of Springfield, Ill. A farewell banquet was given him at the Planters' Hotel in St. Louis by the St. Louis Electric Club.

G. N. Turner was recently appointed manager of the Washington-Idaho Water, Light & Power Company at Castle Rock, Wash., succeeding H. A. Bottomly.

Cyrus Schumacher, for the last ten years superintendent of the Bluffton (Ohio) Light and Water Works, has resigned to go into the business of manufacturing air motors.

R. C. Coffy, formerly manager of the Puget Sound Gas Company, Everett, Wash., will succeed George H. Wilmarth as manager of the Sapulpa (Okla.) Electric Company.

George H. Wilmarth, formerly manager of the Sapulpa (Okla.) Electric Company, has been appointed manager of the Muskogee Gas & Electric Company, Muskogee, Okla., succeeding J. F. Owens, who has been promoted.

Prof. Dugald C. Jackson, the head of the department of electrical engineering of the Massachusetts Institute of Technology, has received the commission of major in the Engineers' Reserve Corps and has been ordered to France. Major Jackson began his educational work as professor of electrical engineering at the University of Wisconsin, where he stayed from 1891 till 1907, when he was called to the Massachusetts Institute of Technology to fill the chair of electrical engineering. In the same year he was named in charge of the department at the Institute, a position which he still retains. In 1913 he became in addition a member of the staff of the electrical engineering research laboratory. This laboratory led to the establishment at the institute in 1917 of a division of electrical research, of which he was one of the directors. Major Jackson has been president of the American Institute of Electrical Engineers and of the Society for the Promotion of Engineer-

F. V. BURTON

mer of 1902 Mr. Burton entered the employ of the Bryant Electric Company, where he has remained ever since, first as service correspondent, in 1907 as eastern sales manager and now as general sales manager. Mr. Burton is active in several of the sections of the Associated Manufacturers of Electrical Supplies.

D. C. JACKSON

ing Education and a member of other national associations, the American Society of Civil Engineers and the American Society of Mechanical Engineers, also of the English Institution of Electrical Engineers and the Société Internationale des Electriciens. He has contributed largely to the literature of electrical engineering.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

FILLING OF STEEL ORDERS ON PRIVATE ACCOUNT HELD UP

Facilities of Mills and Blast Furnaces Devoted Solely
to Government Requirements for
Thirty Days

At a meeting of fifty iron and steel manufacturers held in New York City April 26, after a conference with government officials, it was decided to hold in abeyance practically all orders for commercial steel. By this action the heads of the industry engaged to put their entire plants at the disposal of the United States and the allied governments for the production of material for the munition factories and shipyards, thereby sidetracking indefinitely contracts entered into with private buyers. Therefore manufacturers of electrical apparatus, machinery, supplies, accessories and a long line of specialties and staples for which steel is essential, unless requirements have been anticipated and sufficient stock is on hand to meet the demand, will be obliged to curtail or defer production and postpone promised deliveries.

Exceptions from this program, it is understood, will be only those buyers of commercial steel who secure government authorization for the early completion of their orders. The initial steps in this schedule for concentration were taken several weeks ago, when a number of companies decided to shelve for thirty days all commercial orders.

Furthermore, a fresh survey of steel consumption throughout the country made by the government requires that each seller of steel be told by his customer or the buyer the precise use to which steel already ordered is to be put. All tonnage either on government or civilian orders is to be so itemized. The various rulings that have been made as to priorities in manufacture and shipment are to be elaborated, so that in substance there will be a definite sequence all along the line, the lesser essential commodities to be placed nearer the bottom of the list.

PRODUCERS AND DISTRIBUTERS MARK UP WEATHERPROOF WIRE

Increasing Cost of Cotton Is the Cause—Scarcity of
Tin May Affect the Rubber-Covered
Product

Weatherproof wire has responded to the increasing cost of cotton by an advance of from 1 cent to 2 cents a pound recently. Cotton has more than doubled in cost within a year, and therefore weatherproof manufacturers feel justified in adding their extra expense to the finished article. In fact, the cost of production has steadily been going up fractionally for some time. Jute, which is used as an insulating material on copper cable, is also high and difficult to obtain, and a revision of quotations may be made on the finished product.

A difference of figures is noted as between various producers. One large company, selling in quantities, quotes 26½ cents a pound for weatherproof, declaring that no change in price has occurred for several months. A second manufacturing concern of equal standing, which specializes on power-house orders, quotes from 25 cents to 26 cents, and states that it is glad to handle all business it can get at that figure. With 23½ cents as the government price on raw copper the concern says it finds ample margin in such transactions. A third firm, which also sells almost exclusively to power houses, confessed it was high in naming 27½ cents.

Jobbers estimate their requirements on a 30-cent base,

the ELECTRICAL WORLD quoting weatherproof in 100-lb. lots, New York, 28¼ to 34¼ cents; Chicago, 33.42 to 38.35 cents, which has ruled for some time. Jobbing houses accept these prices, but it is probable that an order of some size may be booked on a closer figure. One prominent distributor has notified the trade of an advance of 2 cents a pound.

Rubber-covered wire, on account of the unprecedented cost of tin, may also be subjected to a revision if the metal goes much higher. This week Straits tin cannot be bought at any price, and it is nominally quoted at \$1 a pound, with a possibility of \$1.50 next month. Chinese tin, which is not so pure as Straits, containing a greater percentage of arsenic, but answering perfectly for coating bare copper wire for rubber covering, sold at 92 cents, May arrival.

FUEL ORDER BRINGS ECONOMY IN WASHING-MACHINE INDUSTRY

Idea That Savings Would Need to Be Made or
Output Curtailed Stimulated Manufacturers to
Renewed Efforts to Increase Efficiency

According to a report issued from the American Washing Machine Manufacturers' Association, the industry operated under restrictions in accordance with its pledge and the fuel order for the month of January, 1918. The monthly reports from members in practically every case showed that the manufacturers practiced the economies to which they had pledged themselves without decreasing their volume of production, except as such a decrease was caused by the Garfield holidays and the lack of transportation facilities. Most of the manufacturers co-operated with the War Service Committee and with the government. This co-operation meant a saving of labor per unit of production, a saving of materials, including fuels, and a saving in transportation facilities.

Increasing costs and increasing federal taxation were doing much to reduce the margin of profit in the industry even before the manufacturers heard of the proposed restrictions. Skillful managers had already begun the burdensome task of trying to reduce the cost of production. The proposed restrictions, however, acted as a club to make the manufacturers begin to put into operation plans to save fuel, material and labor.

LARGE DROP IN FEBRUARY ELECTRICAL GOODS EXPORTS

For First Time in Many Months Figures Fall Below
Four-Million-Dollar Mark—Eight Months Ended
with February Show Total of \$34,735,741

Official figures on the exports of electrical merchandise manufactured in the United States during February last give a total of \$3,446,801, or more than \$100,000 less than in February, 1917. This is the first time in many months that the export of electrical goods has fallen below the four-million-dollar mark. There is a very noticeable decrease in the exports of wire and cables. These had been falling off to some extent for a considerable period. Not all of this falling off has been in volume, however; some of it is accounted for by lower prices.

The figures for the eight months ended February last show a total of electrical exports of \$34,735,741, as compared with \$31,793,041 for the corresponding period of the previous year. The following figures were compiled by the Bureau of Foreign and Domestic Commerce:

	February		Eight Months Ended February	
	1917	1918	1917	1918
Articles				
Batteries	\$227,105	\$140,742	\$1,769,158	\$2,213,082

Total	\$3,575,073	\$3,446,801	\$31,793,041	\$34,735,741

METAL MARKET SITUATION

Propaganda for 25-Cent Copper—Weatherproof Wire Advance—Tin Exceedingly Scarce and High

A determined effort on the part of the producers and refiners is being made through propaganda to persuade the War Industries Board to advance the price of copper from 23.50 cents to 25 cents a pound. Reports are spread that this is now assured by those in "close touch with the producers." The increase, to follow the same authority, to give the refiners 1¼ cents a pound and the producers 1 cent. The production is also said to have decreased 17 per cent and the consumption of the metal to have swollen enormously. Yet one authority says: "It is very doubtful if this claim will be recognized by the government, public statements issued by the various companies show that, compared with other metal industries, copper at 25.50 cents is the rich sister and spelter the Cinderella of the metal trade. There is no indication that recent production has not been equal to all demands." A week ago Holland placed an embargo on tin from the Dutch East Indies; indeed, one has practically been in effect since March. Weatherproof wire has advanced slightly in price. No Straits tin is purchasable for any delivery or shipment. A nominal quotation of \$1 was made this week. Chinese, May delivery, is quoted at 90.50 cents to 91 cents a pound. The Commercial Economy Board of the Committee of National Defense has been conferring with a large number of manufacturers, including producers of electric appliances, babbitt metal and solder. The purpose is to adopt means for the conservation of the tin supply, with a view of obviating an acute shortage of the metal. Lead metals only show a shading in lead.

THE WEEK IN TRADE

WITH a few changes in prices the sale of electrical goods in all parts of the country is maintaining a fairly high level. Commercial business, as against the tremendous buying of material and equipment for war uses, is rather quiet; but at that the volume and value are considerable. Floodlighting requirements for cantonments, camps and shipyards are large. There are also gratifying sales of domestic appliances, especially washing and sewing machines and vacuum cleaners. Rush shipments of conduit have relieved the situation in the Far West to some extent, but in the East stocks in several sizes continue scarce, owing, of course, to transportation delays.

Labor in manufacturing centers is becoming still more scarce, and the demand upon essential man power grows heavier. This is leading to a stronger demand for all kinds of labor-saving equipment and the more general employment of women.

Predictions that the great drive for the third Liberty loan would control collections do not seem to have been fulfilled. Credits are closely watched.

NEW YORK

District distributors and local jobbers are doing a very satisfactory business, civilian and governmental. Officials scour the market for electrical goods needed in manifold ways in the installation and upkeep of industrial enterprises engaged wholly or in part in the production of war material. The trade is lending every assistance in this respect cheerfully and promptly, and with no little pride. The drawing on reserve stocks of staple merchandise, along stupendously liberal lines at times, is reducing the visible supply of many items, particularly conduit.

Some price advances have been made, and others are mentioned as likely to occur. As an example of how goods are moving it may be reported that shipments of electric apparatus from the plant of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., in March amounted to 1200 carloads, a new month's record.

Collections are referred to as running from fair to excellent, and credits firmly maintained.

HOUSEHOLD SPECIALTIES.—The stock of sewing machines is none too abundant, owing to the trouble and delays incident to obtaining fractional motors, the supply having shrunk in an unexpected way within the last month or longer. The production of vacuum cleaners of standard makes is also curtailed for lack of metal essentials—steel and aluminum. A shortage is probable, if not already present. Prices are stationary. Sales of electric washing and ironing machines are reported as heavy; in instances the demand exceeds the supply. This activity is stimulated by the scarcity of domestic help and the high wages insisted upon by laundry operatives. Two leading factories a few weeks since advanced prices 10 per cent on both ironing and washing machines. A Western-made washing machine was recently marked up 15 per cent. A local distributor announced these increases for the Eastern territory April 1. A shortage in both ironing and washing machines, owing to the difficulty of getting copper and galvanized iron, is impending. Deliveries have lengthened on this account to about thirty days.

FUSES.—Renewable fuses are having a very good sale. Deliveries are what may be said to be prompt, no later than a week or ten days at the outside, owing largely to transportation delays. Where parcel post is utilized shipments are still shorter. Discounts to dealers in standard packages are quoted by one concern as 45 per cent; half package, 40 per cent; one-fifth package, 33 per cent. To

jobbers carrying the regulation stock the discounts are more liberal.

SOLDERING IRONS.—There was a run of short duration on local stock by jobbers. None of the orders was large. They came just prior to the schedule advance.

PORCELAIN.—Knobs, cleats and bushings are coming into the market very slowly, factories being swamped with orders and shipping restrictions creating no end of interference. The labor situation at the plants in Indiana, Ohio and West Virginia is occasioning grave concern.

POLE-LINE MATERIAL.—Yellow-pine cross-arms, oak brackets and locust pins are not available for small requirements. The government has requisitioned locust so heavily that the trade may have to consider substitutes. Rock elm is already employed in some localities.

CONDUIT.—Stocks are closely held, and conduit of all sizes is not being freely offered. Fittings for exposed work are in great demand, but jobbers are encountering difficulty in relying upon factory shipments, a condition which has prevailed for several months.

LAMPS.—Government and commercial requirements are being gradually caught up with by the producers, owing, it is said, to the enforcement of the daylight-saving law. The rumor of a higher price for lamps, which is being industriously circulated in some circles, is contrary to the language of the lamp contracts. Accordingly, no higher prices can be expected prior to 1919. No reserve stock has been accumulated at the factories.

ASBESTOS INSULATION.—Reported advances in asbestos mineral, which has been on the rise for a year and more, have not as yet affected the cost of asbestos insulation. Manufacturers state that no revision is contemplated, but with fluctuations in other lines "change without notice" may rule in this case.

CHICAGO

Seasonable goods of all kinds are selling freely, considering the various drawbacks by which the electrical trade is hampered. Dealers report better collections, which also are reflected in the statement of jobbers. The jobbing houses express a belief that there will be a serious shortage in motor fans, of the smaller sizes especially, and are advising retailers to place orders as soon as possible.

TELEPHONE BRACKETS.—There has been an extraordinary demand through jobbers for telephone brackets and extension arms. Most of this equipment is going to the government, probably to equip new offices which are being established. Two months' delivery is being quoted.

BOSTON

The volume of trade is still somewhat below that of a few weeks ago. The dearth of building operations is unquestionably a factor in the situation. It was announced a few days ago that the government plans to expend about \$7,000,000 in increasing the repair facilities at the Boston Navy Yard. Collections are somewhat improved, despite the retrenchment to be seen in purely civilian business. Deliveries, on the whole, are better. Liberty loan financing occupies the center of the stage, and appliances are said to be moving a little slower in retail circles for this reason. Labor appears to be getting scarcer all the time. With the successive additions to the National Army the drain upon industrial man power grows heavier, and it will become more and more a factor in the sale of labor-saving equipment and the introduction of women into the commercial fabric.

ELECTRIC RANGES.—The demand for these exceeds the ability of central stations in the larger areas to provide the necessary service. Prices are steady. The principal limitation to a widespread extension of electric range application appears to be the restrictive policy of central stations regarding new services.

WASHING MACHINES.—Business continues remarkably healthy in these units. Even the smaller contractors and dealers are taking up the merchandising of washers successfully. No recent price changes are noted.

CONDUIT.—Nothing very encouraging can be said about deliveries. Some jobbers who stocked up long ahead of the present demand for larger-sized pipe are still filling orders promptly. With the government's restrictions upon conduit shipments the outlook is not very satisfactory for stock accumulation along broad lines.

APPLIANCES.—Business is a little quieter, owing, according to some observers, to popular absorption in the third Liberty loan campaign. Vacuum cleaners are moving well, as are irons, toasters and heating pads.

MOTOR-DRIVEN COAL LOADERS.—The demand is very healthy for portable machines of this type. One New England manufacturer is placing at least one outfit a week in service by making delivery over the road and ordering stock from Boston distributors. The small alternating-current motors used are now being obtained with little delay through city jobbers.

FLASHLAMPS.—Dealers report a shortage in miniature lamps and some difficulty in filling stocks due to railroad delays. Government demands are very heavy for miniature lamps and have interfered with the production of standard types. Sales to cantonments and navy yards are in good volume, the former paralleling the various draft movements campward.

FARM LIGHTING SETS.—Inquiries are coming in faster as the road conditions improve in the interior, and the outlook is excellent for the summer's business. An advance in the price of storage cells was scheduled for May 1, but the increase on farm lighting sets recorded some weeks ago appears to absorb this without present need of further rise.

FUSES.—Stocks are substantial and business is well maintained.

ASBESTOS AND EBONY BOARD.—The demand for this material is very heavy for both land and marine work. Labor is scarce, and prices were advanced about two weeks ago. Factory facilities are hard pushed to get out the orders now on the books, and there is a present scarcity in the more common thicknesses of this insulating material.

PORCELAIN FITTINGS.—Some improvement in deliveries is noted. The available stocks are rather spotty in regularity of sizes and types, but the situation is showing signs of real betterment.

ATLANTA

Although indications point to a lessening of activity in industrial ventures and construction for this week, the volume of building appears to be holding up fairly well, considering the fact that all energies are now being utilized to put across the third Liberty loan. New organizations are confined principally to cotton products, oil refineries and minerals. Government expenditures in the South continue as anticipated. Extensive construction is being carried on in Alabama, Florida, Georgia, North Carolina and bordering States. This construction covers barracks, hospitals, warehouses, aviation field developments and cantonment extensions. Manufacturers report a falling off in inquiries and actual sales to central stations. The volume of sales in large apparatus has reached a low level.

TRANSFORMERS.—The call for distributing-type transformers from the central stations shows a decrease, with a corresponding report from factories that capacities up to 100 kva., 2300 volts to 6600 volts, are promised for four weeks, 33,000 volts for six weeks. Ratings up to 200 kva. covering the same voltage range are promised for eight weeks. The slowing up of central-station demand is offset to some extent, however, by steady government buying of ratings from 50 kva. to 200 kva. Local stocks are in good shape in capacities to 25 kva. While freight embargoes are affecting all lines more or less, transil oil, especially, is slow in coming in. Rumors are afloat that transformers are due for a jump in price soon.

SERIES LIGHTING OUTFITS.—Manufacturers report that business from the central stations is light. A strong demand continues, however, from government sources. A substantial demand exists, too, from textile mills for village

street lighting. This class of business has created a strong demand for the pole-type constant-current transformer. Stocks of the stationary-coil type are good. Shipments on the movable-coil type are promised for four to six weeks.

FLOODLIGHTING.—The volume of sales to industrials and government account is big, with a decided increase over the past few months. For spot-light purposes the 400-watt is popular, but for general floodlighting the 1000-watt unit seems to come in for greater utility. Shipments are slowing up materially, owing to the fact that factories are deluged with orders. Local stocks are kept depleted by constant government requirements necessitating immediate delivery. Prices remain steady.

INSTRUMENTS.—Substantial sales are recorded for the various switchboard types. The volume of sales originates at industrial sources, however, as very little business of this nature is coming from central stations at this time. The demand for portables is steady and satisfactory. Shipments are very good considering present conditions.

METERS.—A decided slump has been noted of late, covering both the popular residence and the polyphase power type. The present volume of business compared with last year shows a decrease of approximately 50 per cent.

OIL CIRCUIT BREAKERS.—A steady demand exists from industrial sources. Central-station sales are off, showing only spotty tendencies of improvement. Shipments continue slow.

SEATTLE

A gratifying volume of sales for the past month is being maintained along the line of domestic appliances. There has been a noticeable increase, particularly in sales of washing machines and vacuum cleaners of the small hand type. Sales of sewing machines also show a decided increase over the past week. Retailers report the movement of sewing and washing machines as unexcelled. The feature of the week's business, however, was the award of a contract for a large amount of general electrical supplies for shipyards in the Portland territory. The larger part of the order was schedule materials, although there was some power apparatus. With but one exception this contract was the largest awarded since the first of the year. There were no fluctuations in prices during the week, although some were expected.

The arrival of several cars of conduit assisted materially in relieving the strained condition which has existed the past month. Notices were received by local jobbers of other cars en route, and the situation at present looks considerably brighter. A carload shipment of sewing machines will fill back orders and replete exhausted stocks. The lamp shortage in Seattle is relieved somewhat, still there is a dearth of larger sizes. Sales to shipyards and industrials in the Seattle field show no decided increase or decrease. The Gray's Harbor and Portland fields report increasingly heavy sales. The establishment of several projected concrete shipbuilding plants in the Northwest at Everett, Tacoma and Vancouver, Wash., is attracting considerable attention.

Authorities state that the actual production of lumber under the eight-hour day in the Pacific Northwest continues to be approximately 10 per cent less than under the normal ten-hour capacity. Indications point to heavily increased government buying to care for additional cantonment building, ship materials and for 100,000 freight cars. It is unofficially reported that car building at plants in Seattle, Tacoma and Portland will share in the government's car-building program.

Reports from various cities in the Northwest indicate that building operations this summer will be much greater than in many years. In line with other shipbuilding cities in the Northwest Astoria, Ore., has taken steps to secure a portion of the fifty-million-dollar fund appropriated by Congress for the relief of the shipyard housing problem. Spokane is experiencing unusual activity in building with particular reference to repairs and improvements of medium-priced residence properties. Smaller towns throughout the Inland Empire also report increased building.

Within the next few weeks an army of 3000 soldier farmers will be released from military duties at Camp Lewis to

assist farmers in eastern Washington and Oregon in planting spring crops.

Pole-line materials, replacements and general maintenance work, especially in eastern Washington, have resulted in increased sales of poles, cross-arms, insulators, etc. The volume of sales in the Puget Sound territory is below expectations. Along this line utility companies are confining themselves strictly to maintenance work. In porcelain the predicted advance has not materialized. Recent heavy sales have reduced stock materially. New stocks are comparatively hard to obtain. Collections are not suffering from the Liberty loan drive.

SAN FRANCISCO

The electrical business is slowing up, especially in the volume furnished by dealers and contractors.

Collections are reported slower than for a few weeks past. The most notable building permits are still for canneries, Rosenberg Brothers reporting a five-hundred-thousand-dollar packing and storage plant. And it is significant that similar work in Mountain View has been held up for lack of industrial housing. Representations have already been made to Washington in this regard. The United States government has leased forty additional acres for its San Pedro cantonment and intends to enlarge the Letterman Hospital in San Francisco and the Benicia Arsenal. Notable shipbuilding construction is a four-way equipment for the Union Construction Company at the Oakland mole and a larger plant and concrete dry dock for the Rolph Shipbuilding Company on the Alameda shore of the bay.

BELLS.—Sales of small iron box bells are slow, but there is a big call for large bells, especially waterproof bells and specially wound types for shipbuilding work. This demand is so large and so well maintained that some manufacturers are carrying large-sized bells of this sort wound for 100-volt direct current for Pacific Coast delivery. Also to be noted is the increasing use of transformer bells.

HOUSE GOODS.—This line, which includes annunciators, push-buttons and other fancy electrical hardware, is very slow, owing to lack of house and hotel wiring.

SCHEDULE MATERIAL.—Demand has suffered in common with all other staple contracting lines. Because of increase in freight rate the prices on standard sockets and switches are to be advanced 10 per cent. The best-moving schedule item just now is the National Code fuse, which is being supplied in lots of 1000 and 5000 to shipbuilding plants.

FIRE-ALARM MATERIAL.—Each week brings its quota of inquiries, most of which originate from lumber plants and mines, although the increasing lawless element has caused several towns to consider some assistance. Particularly noticeable is the demand for electric sirens, which seem to have been standardized for effective alarm work.

CONSTRUCTION TOOLS.—The demand is very slack on account of a lack of extension work and because of the quiet winter, which was free from storms that necessitated reconstruction.

TAPE.—The total demand is about 20 per cent below that of last year, but tape is difficult to get from the Eastern factories, which usually require four weeks to fill an order. To this must be added forty days for delivery to the Pacific Coast.

STANDARD PORCELAIN MATERIAL.—The demand is very quiet because of lack of country house-wiring jobs. Stocks are good.

GLASS INSULATORS.—The price was recently advanced about 15 per cent because of the increased freight rate. There is very little demand owing to the almost complete shut-down on all power extensions. Local stocks are good, in fact, too good for present conditions.

RAILWAY EQUIPMENT.—Stocks are big, with absolutely no demand, save for a few extra field coils. Practically no railway motors are being shipped.

LAMPS.—Deliveries and sales are good, and, as the market is in a very healthy condition, the sales from lamp agents are good and are well handled.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Heavy-Duty Polarized Attachment Plugs

An attachment plug designed to be used interchangeably with heavy-duty polarized wall and flush receptacles has been recently placed upon the market by Harvey Hubbell, Inc., Bridgeport,

KNIFE-BLADE CONTACTS PLACED AT
RIGHT ANGLES

Conn. This heavy-duty polarized attachment plug is rated at 660 watts and 250 volts. The knife-blade contacts are placed at right angles to each other to assure polarization.

Circuit Breaker with Self-Timing Attachment

A self-timing circuit breaker for the protection of motors during starting or running is being manufactured by the Roller-Smith Company, 233 Broadway, New York City. Interposed in the path of the trip armature is a pivoted hook-shaped barrier under two independent controls. One control is thermal and depends upon the expansion of an iron rod. This rod is heated at the same rate as the motor, which is being protected by the same current that operates the motor. When the rod expands it retracts the barrier, causing the breaker armature to trip when the

BARRIER CONTROLLED BY TWO INDEPENDENT METHODS

heating is excessive. It does not matter how this excess comes about—it may be either a prolonged starting current in the motor or a variable load with high requirements.

The other control, which is electro-

magnetic, retracts the barrier instantaneously if a mechanically dangerous load is suddenly applied.

Both controls are adjustable for either the maximum current which may continuously flow or the emergency overload value. They may be adjusted independently if desirable. Ordinarily, however, the controls are set to protect the average motor of normal ampere rating, therefore no further adjustment is required.

Combined Washer and Wringer

A combined washer and wringer in which a dolly and a disk are used to agitate the clothes is being manufac-

REVERSIBLE WRINGER MAY BE PLACED IN
FOUR DIFFERENT POSITIONS

tured by the Superior Machine Company, Sterling, Ill. It is known as the "Submarine" type and is belt-driven by a 0.25-hp. electric motor, which also operates the wringer by means of gears and rod drive. The wringer is reversible and may be placed in four different positions, so that all of the operations, involving rinsing, wringing, etc., can be performed easily. This line of washing machines is manufactured in several different styles including a short-bench type, a twin-tub washer with wringer in between, and an extended-stave-leg type.

Attachment Plug with Few Parts

An attachment plug that has no screws to disassemble or lose is being manufactured by Mueller Electric Company, 423 High Avenue, Cleveland, Ohio. The plug has screw connections, so soldering is not required for connection to the appliance. An interest-

ing method is used to connect the terminal to the brass shell of the plug. The brass shell, as shown in the accompanying illustration, is removed, and the terminal is inserted through the slot in the composition shank. The

TERMINAL CONNECTION MADE BETWEEN
SHELL AND COMPOSITION SHANK

brass shell is then replaced and when screwed on to the composition shank holds the terminal against the shank in such a manner as to provide a permanent connection. The device is small and adapted for any kind of electric appliance.

Automatic Pressure Governor

A pressure governor to control standard self-starters for motor-operated pumps and compressors has been developed by the General Electric Company, Schenectady, N. Y. The governor will maintain a pressure between predetermined limits on any gas or liquid systems that will not corrode the Bourdon tube.

This governor is listed as CR 2922 and can be used on any standard alter-

POSITION OF STOPS IN SCALE CONTROLS
RANGE OF PRESSURE IN TANK

nating-current or direct-current circuit. It is rated for pressures of from 60 lb. to 500 lb. (89 kg. to 69 kg. per sq. cm.) and will operate within settings of from 3 lb. to 12 lb. (1.4 kg. to 5.4 kg.) between high and low pressures. Gov-

errors for higher pressures can be supplied if desired.

The governor consists of a Bourdon tube, an indicating needle, a graduated pressure scale, adjustable pressure stops and a relay which actuates the contacts in the control circuit of the self-starter. The free end of the tube *T* in the illustration produced herewith is mechanically connected to the indicator needle *N* and moves it over the scale as changes of pressure affect the tube.

When the pressure is at the low limit the contact *C* on the needle *N* completes the circuit through the contact *C'* on the movable arm *M*, which at the low-pressure limit rests against the stop *P*. When this contact is made the circuit is completed through the relay coil *R*, causing the armature to close, and causes the motor to operate. The relay armature is attached to the spring which holds the contact *C* firmly against *C'* until contact is broken at *P*.

As the pressure increases the needle pointer moves to the right, and its lower part, to which the contact *C* is attached, moves to the left, followed by the movable arm *M*. When the high-pressure limit is reached the movable arm is prevented from traveling further by stop *P*. The needle continues its course, breaking the circuit by separating contacts and de-energizing the relay *R*.

Automatically Controlled Electric Pump

Mast, Foos & Company, Springfield, Ohio, have recently placed on the market the "Buckeye" electric house pump for use with cisterns and shallow wells. It can be operated by energy from electric service or trolley lines or from a farm lighting and power system.

The pump is controlled by an automatic switch and is provided with large oil pockets for all bearings. It therefore requires very little attention. The

AIR CHAMBER INSURES STEADY FLOW OF WATER

driving mechanism is totally inclosed and runs in grease. Felt washers prevent the grease escaping or dirt getting into the bearings. Roller bearings of a special type are used that insure easy starting, a minimum amount of power

for operation, perfect alignment, and durability.

The outfit is rated at 180 gal. (681.3 l.) per hour, which is said to be sufficient for supplying all the water that would be required for the bathroom, kitchen and laundry of an ordinary dwelling. It is equipped with an air chamber and vacuum chamber to prevent water hammer and to insure a steady flow of water. The valves are faced with rubber to eliminate any noise in operation.

Very small floor space is required for this outfit because the pump is of the vertical type of construction and the motor and driving mechanism are placed directly above the pump proper.

A Motor-Operated Rubbing Machine

A motor-operated rubbing machine for wood-surface finishing has been developed by the Mattison Machine Works of Beloit, Wis. The machine is operated by a General Electric Company fractional-horsepower motor which moves the rubbing blocks together and

DUST-PROOF CASE PREVENTS INJURY TO THE MOVING PARTS

apart at an even speed. The speed is governed by a regulator which can be varied according to the class of work to be done. The machine is inclosed in a dust-proof aluminum case and weighs about 35 lb. (15.8 kg.). This weight gives sufficient pressure for ordinary purposes, but additional pressures can be applied by the operator if it is desired. The device can be used for rubbing surfaces 15 in. (3.8 cm.) in length and of practically any width. It may be attached to an ordinary light socket and consumes about 250 kw.-hr. of energy.

Hand and Face Drying Machine

A machine that will heat and blow air through an adjustable nozzle for drying the face and hands has been placed upon the market by the Groton Electrical Devices Company of New York City. The machine consists of a white-enamelled iron standard with a motor, fan, heating element and mirror.

It may be connected to ordinary lighting circuits. The machine is set in operation by means of a foot lever at the base of the standard. The nozzle through which the air is discharged is adjustable so that the air may be directed on the hands or up into the face. This device is particularly adaptable to general washrooms in hotels, office buildings and public places.

Disk Stove Chafer

A device that can be used as a chafer disk stove, a frying pan or a saucepan has been developed by Landers, Frary

ELECTRIC STOVE OF MANY USES

& Clark of New Britain, Conn. The two-heat appliance is equipped with a clamp which holds the pans in place on the stove. Either pan may be placed upon the stove separately or the stove may be utilized as an ordinary disk stove.

Loom Fastener for Outlet Box

A loom fastener, approved by the National Board of Fire Underwriters, that will fasten two pieces of loom at one time to an outlet box is being manufactured by J. J. Duck, 432 St. Clair Street, Cleveland, Ohio. The fastener will grip a piece of loom extending only 0.25 in. (0.63 cm.) through a box or plate. When a stud is used on the outlet box the same bolt or screws that hold the stud will also serve to hold the fastener in place. The device is made of spring brass and will hold 0.21 in. (0.56 cm.) and 0.25 in. (0.63 cm.) flexible tubing.

Open-Construction Pipe Bender

An open-construction pipe bender that will bend conduit or pipe at any angle from 1 deg. to 180 deg. is being manufactured by the Akron Electric Company of Akron, Ohio. The bender is light in weight and is strongly constructed.

PIPE MAY BE INSERTED AND REMOVED WITH EASE

It consists principally of a small bending wheel and a roller. Only a very small amount of energy is required to bend the pipe. It is constructed so that the pipe may be inserted and removed easily.

Trade Notes

G. A. BINE, formerly manager of the meter department of the Varnall-Waring Company, Philadelphia, has been appointed sales manager.

N. M. GARLAND of New York City, district manager of the Ohio Brass Company, Mansfield, Ohio, has been elected a member of the board of directors.

THE PARAGON ELECTRIC COMPANY of Chicago on May 1 removed from 9 South Clinton Street to larger quarters in the Old Colony Building, 37 Van Buren Street.

THE JEFFERY-DEWITT COMPANY, manufacturer of high-tension disk insulators, will after June 1 move its factory from Detroit, Mich., to Kenosha, W. Va.

LANDERS, FRARY & CLARK of New Britain, Conn., have purchased the business of the National Electric Utilities Company, of New York City, and will increase and develop it.

THE SUNDH ELECTRIC COMPANY of New York City on May 1 removed its main offices and factory to Avenue C and Parkhurst Street, Newark, N. J. The New York office is at 51 East Forty-second Street, room 301.

ALBERT TATE SMITH, lately manager of the R. U. V. Company, 50 Broad Street, New York City, has returned to the Permutit Company, with which he was formerly connected, to take the position of assistant manager of sales. Mr. Smith is widely known in the water purification field.

THE MACLEOD MANUFACTURING COMPANY of Chicago announces that it will move from its present factory at 420 Orleans Street to its new building at the corner of Austin and Wells Street. This company manufactures extension brackets for telephones and other office supplies.

THE SPRAGUE ELECTRIC WORKS OF THE GENERAL ELECTRIC COMPANY, New York City, announces the removal of its office in Boston from 201 Devonshire Street to 81 State Street, room 906; also the removal of its quarters in St. Louis from the Chemical Building to the Pierce Building, room 1352.

CHARLES C. SCHNEIDER, manufacturers' agent, has moved from 329 to 327 Broadway, Market Building, Detroit, Mich., where larger quarters have been secured. Mr. Schneider, who represents the Pittsburgh Lamp, Brass & Glass Company, has recently added to his line the transformers made by the Cumberland Electric Company of Memphis, Tenn.

THE NATIONAL BANK OF COMMERCE of New York City has printed the export trade associations act (Webb act), as approved April 11, with annotations, in convenient pamphlet form. The enactment of the law is a decisive step in the direction of an expansion of foreign trade. Copies may be had by applying to the foreign department of the bank.

FRED W. GODFREY has severed his connection with the Republic Electric Company to become associated with the American Carbon & Battery Works of the National Carbon Company, Inc., of East St. Louis, Ill. Mr. Godfrey will cover all of Minnesota, North and South Dakota, Nebraska, Colorado, Montana, Wyoming, Utah, Idaho and New Mexico. He has traveled the Central West for many years.

W. W. EWING, special agent of the Department of Commerce, Bureau of Foreign and Domestic Commerce, of Washington, D. C., has just finished an investigation, made on the ground, of Colombian markets for construction materials and machinery. In this report will be found a general introduction covering industries, resources, means of communication, architecture and construction, etc., in Colombia, S. A., and chapters devoted to specific building activities, markets for particular lines of materials and machinery, and commercial practices and requirements—all the preliminary data needed to form an estimate of the possibilities of the field. Mr. Ewing finds that Americans have a bigger business in Colombia now than when the war started and sees no insurmountable obstacles in the way of doing even better when peace is made. Copies of the report can be obtained by writing to the superintendent of documents, Washington, D. C., or to any of the district offices of the Bureau of Foreign and Domestic Commerce. The co-operative offices have copies for those who apply in person.

GERMAN-RUSSIAN TARIFF DISPUTES.—The strained tariff relations that existed between Russia and Germany much of the time between 1890 and the outbreak of the war are described in a report just

made public by the Bureau of Foreign and Domestic Commerce, Department of Commerce. The author of the report, Louis Dameratzky, tariff expert of the bureau, gives it as his opinion that, aside from political contingencies, which were not without influence on the tariff relations of the two countries, Russia has been at a disadvantage in negotiating commercial treaties with Germany. The author considers it extremely hazardous to make any forecast as to the future tariff relations between the two countries, but discusses at some length the situation as it existed a few months before the war started. Copies of "Tariff Relations Between Germany and Russia," Tariff Series No. 38, can be obtained at the nominal price of 5 cents from the superintendent of documents, Government Printing Office, Washington, D. C., or from any of the district or co-operative offices of the Bureau of Foreign and Domestic Commerce.

Trade Publications

COAL CONVEYOR.—A single-rope coal conveyor is described and illustrated in a circular distributed by John F. Godfrey of Elkhart, Ind.

VACUUM CLEANERS.—The "Liberty" cleaner, Model C, is described in a folder issued by the Innovation Electric Company, Inc., 585 Hudson Street, New York City.

PLANERS.—The Powell Machine Company, Worcester, Mass., is distributing descriptive bulletins of its various patent planers for high-speed cuts and for standard work.

BUSBAR SUPPORTS.—The Electrical Engineers' Equipment Company is distributing advance sheets on its bulletin No. 107, which describes its new line of busbar supports.

ELECTRIC APPLIANCES.—A catalog and price list of electrical appliances is being distributed by the Hotpoint division of the Edison Electric Appliance Company, Inc., of Ontario, Cal.

SECTIONAL CABINETS.—Sectional cabinets for display counters and for holding tools are illustrated in a bulletin recently issued by Stevens & Company, 375 Broadway, New York City.

CLAMP INSULATOR SUPPORTS.—The General Devices & Fittings Company, Mid-City Bank Building, Chicago, has recently issued a bulletin describing its new clamp supports for pipe and flat mounting.

BLUEPRINT RACKS.—The "Presto" quick-acting holder for blueprints, records, charts, drawings, newspapers, etc., is illustrated in a circular distributed by the National Company, 275 Congress Street, Boston.

REGULATORS AND ADAPTERS.—Regulators and adapters for motion-picture projection for Mazda lamps are covered in a bulletin recently issued by the Argus Lamp & Appliance Company, 322 Euclid Avenue, Cleveland, Ohio.

MOTOR-GENERATOR SETS.—Bulletin No. 3602 is being distributed by the Emerson Electric Manufacturing Company of St. Louis, describing its alternating-current motor-generator sets both with and without switchboards and rheostats.

CIRCUIT BREAKERS.—The Roller-Smith Company of 233 Broadway, New York City, is distributing bulletin No. 501, describing its "self-timing" circuit breakers. These circuit breakers are both thermally and electromagnetically controlled.

SWITCHES.—The Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has recently issued a small two-color envelope folder, publication No. 242, which illustrates and describes the single and two-circuit brass shell used in its porcelain pendent switches.

OXY-HYDROGEN GENERATOR.—The Electrolytic Oxy-Hydrogen Laboratories, Inc., 15 William Street, New York City, have issued a bulletin describing the Levin oxygen and hydrogen generator. The products of this company are sold under the trade name of "Electrolabs."

CENTRIFUGAL PUMPS.—The Wheeler Condenser & Engineering Company of Carteret, N. J., has recently published a bulletin, No. 108-B, embracing its line of centrifugal pumps. The bulletin shows the latest Wheeler turbine-driven geared centrifugal pumps of various types. Pumps are made for nearly all requirements where large volumes of water must be pumped against low heads.

INCLOSED SWITCHES.—The Square D Company, Detroit, Mich., has issued a new catalog, No. 24-B, describing the Square D

steel inclosed safety switches. The book is of convenient size and can be carried in the pocket for ready-reference purposes. Prices and descriptions of the entire Square D line are given, together with a table of wiring data for single-phase, three-phase and direct-current motors.

LIGHTING APPARATUS.—"Stage and Studio Lighting Apparatus and Electrical Effects" is the title of a new catalog issued by the Universal Electric Stage Lighting Company, 240 West Fifth Street, New York City. The bulletin illustrates and describes many developments in stage lighting which have recently been accomplished. Accessories for motion-picture photography are also included in the bulletin.

STOKERS.—The Sanford Riley Stoker Company, Ltd., Worcester, Mass., has issued a new catalog describing the Riley underfeed stoker. The booklet is well illustrated and shows the construction features and installations of the stokers. Engineering data are also given, together with outline drawings showing the cross-sections and views of different boiler installations. A separate circular included in the catalog gives a list of representative installations of Riley underfeed stokers.

COPPER CASTINGS.—The Titanium Bronze Company, Inc., Niagara Falls, N. Y., has issued a bulletin entitled "High-Conductivity Copper Castings." The bulletin describes copper castings, their manufacture and method of rolling, and tells why high conductivity is needed. Small quantities of impurities present in copper castings may reduce their conductivity by even one-half. Tables are given showing the effect of a mixture of copper with specific quantities of various substances.

ELECTRICAL DEVICES.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued several additions to its catalog, describing overhead relays, automatic starters and portable hoists and dumbwaiter motors. The company has also published electrification data in a bulletin entitled "Electrification of Railroads as a War Measure." This bulletin gives the mechanical features of electrification and shows the various characteristics of electric locomotives used in the electrification of steam railroads.

New Incorporations

THE BRANTLEY ELECTRICAL COMPANY of Terrell, Tex., has been chartered with a capital stock of \$2,000 by A. L. Brantley and others.

THE HELD ELECTRIC COMPANY of Utica, N. Y., has been incorporated by J. E. Vaeth, H. I. and J. P. Held of Utica. The company is capitalized at \$5,000 and proposes to manufacture electrical goods.

THE STERLING ELECTRIC COMPANY of Sacramento, Cal., has been incorporated with a capital stock of \$25,000 by W. A. Weight, C. Weight, C. E. Turner, T. L. Nightingale and Lee Gebhart, Sacramento.

THE ACME-ELECTRIC OIL COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$250,000. The incorporators are: Charles D. Allee, J. B. Bailey and L. B. Phillip of Dover, Del.

THE IDEAL ELECTRIC THERAPEUTIC APPARATUS CORPORATION of New York, N. Y., has been incorporated with a capital stock of \$5,000 by A. and S. Cooper and D. Hertman, 160 East Twenty-third Street, New York City.

THE SLUGLAND POWER COMPANY OF NEW JERSEY has filed articles of incorporation with a capital stock of \$250,000. The incorporators are: Leonard Slugland, Frank P. Venable, John H. Mussiner, Louis J. Patmos, all of Paterson, N. J.

THE W. & R. MANUFACTURING COMPANY of New York, N. Y., has been incorporated with a capital stock of \$100,000 by A. J. Lalibert, L. T. Fetzer and H. Macintyre, 220 West Forty-ninth Street, to make heating and lighting systems.

THE PROGRESSIVE ELECTRIC COMPANY of New York, N. Y., has been chartered by George F. Broyn, 1462 Vyse Avenue, Bronx; Joseph Segal and Philip Segal of New York, N. Y. The company is capitalized at \$5,000 and proposes to manufacture and deal in electric equipment.

THE TIRRELL MANUFACTURING COMPANY has filed articles of incorporation under the laws of the State of Delaware. The company is capitalized at \$50,000 and proposes to manufacture electric-light controllers. The incorporators are: C. L. Rimlinger, M. M. Clancy and F. A. Armstrong of Wilmington, Del.

New England States

PLYMOUTH, N. H.—The Plymouth Electric Light Company is erecting an electric transmission line to the village of Livermore Falls, a distance of 2 miles, to supply electrical service there. Electricity will also be supplied to residents along the line.

PORTSMOUTH, N. H.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 6, under specifications 2904, for furnishing and installing an intake tunnel and circulating pump at the navy yard at Portsmouth, N. H. The cost is estimated at \$45,000.

BOSTON, MASS.—Bids will be received by the lighthouse inspector, Boston, Mass., until May 7 for two oil-engine-driven air-compressing outfits. Further information may be obtained at the above office.

PALMER, MASS.—Plans are being prepared by the Wright Wire Company, 69 Hammond Street, Worcester, for the erection of a new power house, 100 ft. by 125 ft., at its local plant. Griggs & Myers, 110 West Fortieth Street, New York, N. Y., are architects and engineers.

BRIDGEPORT, CONN.—Contract has been awarded by the Bryant Electric Company to Martin & Son for the construction of an addition 60 ft. by 128 ft. to its plant.

Middle Atlantic States

BUFFALO, N. Y.—Plans are being prepared by Frank M. Williams, state engineer, Albany, for a freight and transfer warehouse for the New York State Barge Canal Terminal, Erie Basin, Buffalo, which will be equipped with crane and conveying equipment.

BUFFALO, N. Y.—The final schedule of streets is now being arranged in connection with the installation of the proposed new underground conduits to replace the present overhead wires in various districts of the city. The work will be done by the New York Telephone Company, the Buffalo General Electric Company and other public utilities operating in this section.

MASSAPEQUA, N. Y.—Contract has been awarded by the Board of Supervisors of Nassau County to the Tucker Electric Construction Company, 114 West Thirtieth Street, New York City, for the electrical work in connection with the erection of the new tuberculosis hospital at Massapequa.

MOHAWK, N. Y.—Plans are being prepared by Frank M. Williams, state engineer, Albany, for the construction of a hydraulic power plant on the State Barge Canal at Mohawk, N. Y.

NEW YORK, N. Y.—Contract has been awarded by the board of trustees of Bellevue and Allied Hospitals, 415 East Twenty-sixth Street, to Charles K. Daly, 172 Paynter Street, Long Island City, for the construction of a power house.

NIAGARA FALLS, N. Y.—Plans for power development by the merged Niagara Falls Power Company, the Cliff Electrical Company and the Hydraulic Power Company, authorized by the State Legislature, have been approved by the War Department. Construction work, involving an expenditure of about \$16,000,000, to permit the development of 400,000 hp. from 20,000 cu. ft. authorized to be diverted from the Niagara River by the British-American treaty, will begin as soon as the federal government sanctions the consolidation.

SYRACUSE, N. Y.—Plans are being prepared by the Syracuse Lighting Company for the construction of an electric plant on South Warren Street.

SYRACUSE, N. Y.—The Continental Can Company of Syracuse has awarded contract for the construction of a power house and coal pocket at its factory, to cost about \$60,000.

WATERVILLE, N. Y.—Plans are under consideration by the Waterville Gas & Electric Company for the construction of a new electric plant.

BLOOMFIELD, N. J.—Plans are being considered by the Town Council for improvements to the electric fire-alarm system.

BORDENTOWN, N. J.—Plans are being considered by the City Commissioners for the installation of electrically-operated pumps at the waterworks pumping station.

CAMDEN, N. J.—Permit has been taken out by Kind & Lantesmann for the construction of a new boiler plant at the head of Fifth Street.

HAMBURG, N. J.—The township committee is considering the installation of a new electric street-lighting system.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

JERSEY CITY, N. J.—Plans are being considered by Swift & Company, 154 Ninth Street, for building an addition to their engine and power plant on Henderson Street, to cost about \$23,700.

NEWARK, N. J.—Plans have been filed by A. Fink & Son, 810 Frelinghouse Avenue, for the erection of an addition to the engine house at its works.

PERTH AMBOY, N. J.—The Standard Underground Cable Company, 26 Washington Street, is reported to be considering the construction of a new plant in Ideal Park, on property recently acquired. The company manufactures cables, electric conduits, etc.

PHILIPSBURG, N. J.—Improvements to the electric street-lighting system, including the installation of a number of new lighting units, are under consideration by the Town Commissioners.

POMPTON LAKES, N. J.—The Council is considering the construction of a new municipal electrical power plant on Corning Lake. An ordinance authorizing an issue of \$46,900 for this purpose has been adopted by the Council.

ALTOONA, PA.—Plans have been prepared for an addition, 50 ft. by 130 ft., to the plant of the Altoona Storage Battery Company, 802 Chestnut Street, to cost about \$10,000.

COATESVILLE, PA.—Plans are being considered by the West Chester & Conestoga Traction Company for the construction of an electric railway from the proposed terminus, commencing at the South City line on First Avenue and extending to the iron and steel mills in the center of the town.

HAZLETON, PA.—The Cranberry Creek Coal Company is planning to equip its Cranberry mines for electrical operation by 1920. Overhead trolley wires have been abolished and the mine motors are now charged by storage batteries. The pumps will also be driven by electricity.

HAZLETON, PA.—The Lehigh Valley Coal Company contemplates equipping its entire chain of mines in the Lehigh field for electrical operation as soon as the war is over. The Oneida stope No. 4 will be equipped with electrically-driven machinery this summer. The Gowen & Wolf mines, just put into service, are equipped with electrically-operated machines and hoists.

HOLTWOOD, PA.—The Pennsylvania Water & Power Company is erecting an electric transmission line, 10 miles long, from Holtwood to a point on the Gunpowder River for the government. This line will transmit electricity to the proving grounds of the government at Aberdeen.

MANORVILLE, PA.—Work has begun on the construction of a new power house in connection with the new local plant of the Triple Airless Tire Company of Pittsburgh. The cost of the entire work is estimated at about \$85,000. Herbert & Henderson of Kittanning are architects.

PHILADELPHIA, PA.—Contract has been awarded by the E. F. Benson Company, 926 North Delaware Avenue, to the William Steele & Sons Company, 32 South Fifteenth Street, for the construction of an addition to its engine plant.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 6, under specification 2923, for a motor-driven, two-stage duplex air compressor, having a capacity of 1000 cu. ft. of free air per minute at the navy yard, Philadelphia, Pa.

PHILADELPHIA, PA.—Contract has been awarded by the Badenhausem Boiler Company, 1425 Chestnut Street, Philadelphia, for the construction of a machine shop, 200 ft. by 350 ft., at its boiler works, Cornwells. The company is also planning to erect a five-story office building, 25 ft. by 175 ft., on Walnut Street, Philadelphia, to cost about \$50,000.

PITTSBURGH, PA.—Contract has been awarded by the Heppenstall Forge & Knife Company, Forty-seventh and Hatfield Streets, for the erection of a new boiler plant at its works to C. Huntsman, Pittsburgh, to cost about \$23,000.

SCRANTON, PA.—The Mill Creek Coal Company has recently placed a contract with the Scranton Construction Company for the installation of electrical equipment at its Morea colliery. Energy for operat-

ing the machinery in the mines and also for lighting the interior of the mines and the outside plants will be supplied by the Eastern Pennsylvania Electric Light, Heat & Power Company of Pottsville. The cost of the improvements is estimated at \$200,000.

WASHINGTON, D. C.—Bids will be received at the office of the Commissioners of the District of Columbia, Washington, D. C., until May 10 for furnishing two 3½-ton motor trucks for use in the water department. Specifications may be obtained from the purchasing officer, Room 320, District Building, Washington.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 13, under specification 2905, for power plant improvements, to cost about \$35,000. Further information may be obtained from the chief of bureau.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until May 10 for furnishing, under Schedule 4298½, one generating set at the Brooklyn Navy Yard. Bids will also be received until May 6, under Schedule 4315½, for furnishing 5800 ft. single-conductor cable at Portsmouth, N. H.; Schedule 4318½, for one generating set to be delivered at Pensacola, Fla.; Schedule 4322½, for howlers, annunciators, bells and buzzers to be delivered at Detroit.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until May 6 for furnishing, under Schedule 4180½, electrical material, including switchboards, switches, lamps, etc. Bids will also be received, under specification No. 2879, for furnishing and installing a complete switching equipment for the control of machines in the substations and for the various incoming and outgoing feeders and all connections between panels and the machines.

NORFOLK, VA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 6, under specification 2913, for an electric traveling crane in the structural shop at Norfolk, Va. The cost is estimated at \$8,500.

North Central States

CINCINNATI, OHIO.—Bids will be received by the Board of Education of Cincinnati, Denton Building, until May 13 for furnishing and installing a system of electric clocks and bells in the Lincoln Public School Building. Plans and specifications are on file at 511 West Court Street.

CINCINNATI, OHIO.—All bids submitted for the installation of lighting fixtures in the new court house building have been rejected by the new court house building commission, all bids received having been too high. The lowest bid, which was submitted by the St. Louis Brass Manufacturing Company, was \$62,477. The price fixed as the base figure upon which subsequent bids are to be made is \$60,000. Some changes in design of the fixtures, to make them less elaborate, will be made.

HAMILTON, OHIO.—Plans are being considered for improvements to the municipal electric-light plant.

ST. PARIS, OHIO.—Bonds to the amount of \$5,500 have been voted for improvements to the municipal electric-light plant.

TOLEDO, OHIO.—Press dispatches from Washington state that the War Department has announced that government nitrate plant No. 3, composed of two half units, would be located in Toledo, Ohio, and at Elizabethtown, near Cincinnati. The half unit to be erected at Toledo will be located on the outskirts of the city in the vicinity of the new Acme generating station of the Cities Service Company. The government will expend about \$22,000,000 on this plant and will require a 24-hour load of 35,000 kw. of electric energy, which will be furnished by the Acme Power plant. To provide for this service a second 20,000-kw. generating unit will be installed, making the total output of the plant 40,000 kw. Financing for the installation of the new unit and the erection of the transmission line to the nitrate plant will be provided by the government. Work on the new plant, it is expected, will begin at once.

CHARLESTOWN, IND.—Bids will be received by the township of Charlestown until May 11 for the construction of a new high school building, including electrical wiring and ventilating apparatus. The cost of the building is estimated at about \$36,000. Charles F. O. Pangburn is trustee.

INDIANAPOLIS, IND.—The capital stock of the Merchants' Light & Heat Company has been increased from \$2,000,000 to \$2,500,000.

INDIANAPOLIS, IND.—Plans are being considered by Governor Goodrich and a committee of the Legislature for the erection of one wing of a proposed building and power house for the Indiana University Medical College. The proposed building and power house will cost complete about \$150,000. It is planned to expend \$130,000 of the emergency and contingent fund for the erection of the first wing immediately.

MORGAN, IND.—Work has been resumed on the local plant of the Farmers & Merchants' Light & Power Company.

RICHMOND, IND.—The Kilo Meter Company, it is reported, is planning to erect a plant at Richmond for the manufacture of electric meters. The company's plant at Indianapolis was recently destroyed by fire.

ATHENS, ILL.—The Athens Electric Light & Power Company has filed a petition with the Illinois Public Utilities Commission for permission to erect a high-tension transmission line over the tracks of the Chicago, Peoria & St. Louis Railroad.

HOMER, ILL.—The Homer Electric Light & Power Company has been granted a franchise to install and operate an electric-lighting system in Fairmount.

PECATONICA, ILL.—The Council contemplates the installation of an electrically operated pump at the pumping station after July 1.

MENASHA, WIS.—The City Council is considering the installation of an additional engine in the municipal electric-light and water-works plant.

MILWAUKEE, WIS.—The Universal Machinery Company, 784 Thirtieth Street, Milwaukee, has purchased a site at the north limits of West Allis, on which it is planning to establish a new plant. Tentative plans provide for the erection of a machine shop, 150 ft. by 300 ft.; foundry, 90 ft. by 160 ft.; transformer building and boiler house, 40 ft. by 60 ft., and auxiliary buildings. J. E. Purdy is secretary and treasurer.

MILWAUKEE, WIS.—Bids will be received by the board of industrial education of the city of Milwaukee, Manufacturers' Home Building, Milwaukee, until May 9 for furnishing material and construction, including electric light wiring and air line conduit work, sewer and water supply work, for the first unit of the Central Continuation School, to be erected at the corner of Seventh and Prairie Streets. Plans and specifications are on file at the above office and the office of Van Ryn & De Gelcke, architects, 726 Caswell Block, Milwaukee.

RIPON, WIS.—The Wisconsin Power, Light & Heat Company of Chicago, Ill., is reported to have purchased the property of the Ripon Light & Water Company and its branches, the Greenlake (Wis.) Electric Company, the Wisconsin Power, Light & Milling Companies at Rosendale and Eldorado, the Markesan Light & Power Company and the Kingston Electric Company. These companies, it is understood, will be consolidated under the name of the Central Wisconsin Utility Company.

WINNECONNE, WIS.—The Winnebago Electric Company of Winnebago, recently incorporated, contemplates establishing an electric plant here to supply electricity for lamps, heaters and motors. Richard W. Button is one of the incorporators.

ELDORA, IOWA.—Bids will be received by Calvin Boyland, county auditor, Eldora, until June 11 for construction of boiler house, concrete or brick smokestack, concrete tunnel, heating plant and drainage.

OTTERVILLE, MO.—The installation of an electric-lighting plant, to cost about \$6,500, in Otterville, is under consideration. Jesse Straten is reported interested.

PRAIRIE HOME, MO.—The Simmons Electric Company is contemplating changing its system to 110-volt direct current, using storage battery 24-hour service, consisting of 23 Delco light units with one 60-amp. -hour, 56-cell battery. Kelly Simmons is vice-president.

JAMESTOWN, N. D.—Bids will be received by the City Council until May 6 for furnishing one double suction, two-stageolute pump with a capacity of 700 gal. per minute, against a maximum head of 20 pounds, directly connected to a 2300-volt, three-phase, 60-cycle, slip-ring motor, to be delivered on or before July 1.

MILLER, S. D.—Plans are being prepared for the reconstruction of the municipal electric-light plant and water-works system, for which \$55,000 is available. The proposed plans provide for the instal-

lation of two units (directly connected), at least two boilers, re-building distribution system, etc. Definite plans have not yet been decided upon. William Saltmarsh is manager.

BURNS, KAN.—Bids will be received by the city of Burns until May 7 for the installation of an electric-lighting system, consisting of one 30-hp oil engine, one 25-hp direct-current, 110-volt generator, one 160-amp.-hour storage battery, complete pole line, etc. Archer & Stevens, New England Building, Kansas City, Mo., are engineers.

DIGHTON, KAN.—The contract for equipment, including engines, boilers, generators, switchboard, etc., for the municipal electric-light plant has been awarded to the Merkle Machinery Company. The plant heretofore has been operated by oil engines.

YATES CENTER, KAN.—The proposal to issue bonds for a municipal electric-light plant was defeated. The Yates Center Electric Light & Power Company is contemplating selling its plant. Charles H. Opperman is manager.

Southern States

COMMERCE, GA.—At an election held recently bonds to the amount of \$15,000 were voted for the installation of an electric-light and power plant. Contracts, it is understood, have been placed for machinery and equipment. L. F. Brooks is superintendent.

MARYVILLE, TENN.—The Aluminum Company of America of Pittsburgh, Pa., is planning to build a plant to manufacture nitrate as a by-product of its present aluminum works and hydroelectric development, to cost about \$2,000,000. Electricity to operate the plant will be transmitted from the Alcoa (Tenn.) dam, now under construction, on the Little Tennessee River, 50 miles from Knoxville.

HEADLAND, ALA.—Bonds to the amount of \$10,000 have been voted for improvements to the municipal electric-light plant and water-works system.

LITTLE ROCK, ARK.—Contract has been awarded by the school board for the erection of a grade and junior high school building, to cost about \$128,000, to H. F. Ault, of Little Rock. Heating and lighting systems not yet decided upon. Charles L. Thompson and Thomas Harding, 504 Southern Trust Building, Little Rock, are architects.

MONROE, LA.—Bids, it is reported, are being received by the Standard Gin Company of Monroe on cotton gin and power plant equipment. The company was recently organized with a capital stock of \$60,000. John P. Parker and J. T. Austin are among the incorporators.

BLOCKER, OKLA.—The Tri-State Coal & Coke Company, recently incorporated with a capital stock of \$100,000, is reported to be in the market for mining and power plant equipment. J. A. Dill is among the incorporators.

TULSA, OKLA.—The Atchison, Topeka & Santa Fe Railroad Company contemplates the erection of a passenger station at First and Second Streets, to cost about \$100,000. The company will build a freight depot with terminal yards having a track-are of about 10 miles, and install an electrical interlocking system. The cost of the entire work is estimated at about \$2,000,000.

YALE, OKLA.—The City Council is considering issuing \$200,000 in bonds for the installation of an electric-light plant and water-works system.

BEAUMONT, TEX.—The Kansas City Southern Railroad Company is planning to install electrical equipment to operate its drawbridge across the Neches River in Beaumont.

Pacific and Mountain States

EPHRATA, WASH.—Application has been made to the Commissioners of Grant County by the Ruff Lighting Company of Ephrata for a franchise to erect and maintain electric transmission lines along the highways in Grant County. The company asks for a 50-year franchise to include the unincorporated town of Ruff.

SEATTLE, WASH.—The Skyhomish Power Company has filed with the City Council modified plans for the development of the Stillaguamish power site, submitting estimates covering proposed additional development as follows: Dam to be built at an elevation of 950 ft., with ultimate elevation of 1050 ft. With the development of the

Stillaguamish stream alone, this dam would generate 66,000 hp. at an elevation of 400 ft., or 90,000 hp. with dam at 1050 ft. Building two steel penstocks for standpipe to turbine, 600 ft. long and 8 ft. in diameter, installation of two vertical units generating 30,000 hp., power house of reinforced concrete with provision for future extension to provide space for two additional units of same capacity, to change railway to go north of reservoir and join the present line at the east end of the line. The cost of the above plant, including riparian rights, is estimated at about \$5,000,000. The report has been referred to the City Utilities Commission.

TACOMA, WASH.—The proposal to issue \$5,000,000 in bonds for the purchase of the property of the Tacoma Railway & Power Company was defeated at an election held recently.

GOLD HILL, ORE.—The City Council has taken over, under lease, the city water system from the new owners of the defunct Rogue River Public Service Corporation, which has been operating the system under a 20-year franchise, and which expires in 1920. The arrangement is only temporary, as the city owns the McClure power plant on the Rogue River, with a 500-hp. right, which is to be developed for municipal light and water purposes. Bonds to the amount of \$25,000 were voted for that purpose in 1914.

TOLEDO, ORE.—The Thorsen-Hendrickson Mill Company of Toledo, recently reorganized, it is reported, will take over and operate the local electric-light plant.

LOS ANGELES, CAL.—Plans are being prepared by the Board of Education for the construction of a machine shop, 70 ft. by 100 ft., at the San Pedro High School.

REDDING, CAL.—At an election held recently the proposal to issue \$40,000 in bonds for the installation of a municipal electric-lighting system was carried.

Canada

REVELSTOKE, B. C.—The Lanark Mines Company, it is reported, contemplates the construction of a dam and power plant in Revelstoke to furnish electricity for its mine and mill. The cost is estimated at from \$25,000 to \$30,000. W. B. Dornberg of Spokane, Wash., is manager.

WINNIPEG, MAN.—The provisional government of Manitoba contemplates replacing the present telephone system in Winnipeg with the automatic service, at a cost of about \$1,500,000. Within the next five years, it is estimated that an expenditure of \$600,000 will be required for extensions to the system.

HALIFAX, N. S.—New equipment, including electric street cars, electrical equipment and generating machinery is reported to be under consideration by the Nova Scotia Tramways & Power Company. G. A. Fowler, Lower Water Street, Halifax, is engineer.

BISMARCK, ONT.—The Township Council of Gainsborough, Lincoln County, is considering utilizing Hydroelectric power.

COBALT, ONT.—The Mining Corporation of Canada is reported to be contemplating the purchase of electric motors, pumps, etc.

MONTREAL, QUE.—Extension to its carbide and electrode plants is reported to be under consideration by the Shawinigan Water & Power Company.

MONTREAL, QUE.—Tenders will soon be asked for the construction of a power house for Lamontagne, Ltd., 338 Notre Dame Street, West, to cost about \$10,000. E. Laurie & Company, 243 Bleury Street, Montreal, are architects and engineers.

GULL LAKE, SASK.—The Canadian Pacific Railway Company is contemplating the construction of a pumping station and installation of machinery at Gull Lake, to cost about \$100,000. J. M. Cameron of Calgary, Alta., is manager.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until May 20 for furnishing dynamite, steel cable, copper tubing, vulcanizing material, boiler lagging, pipe covering, roll asbestos paper, etc. Blanks and further information relating to this circular (No. 1217) may be obtained at the above office or the office of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, A. H. Krom, 29 South La Salle St., Chicago. Annual meeting, May 14, 1918.

PUBLIC SERVICE ASSOCIATION OF VIRGINIA. Secretary, W. J. Kehl, Virginia Railway & Power Co., Richmond, Va.

PUBLIC UTILITIES ASSOCIATION OF WEST VIRGINIA. Secretary, W. C. Davisson, West Virginia Water & Electric Co., Charleston.

RADIO CLUB OF AMERICA. Secretary, T. J. Styles, 152 Beach St., Yonkers, N. Y.

ROCKY MOUNTAIN ASSOCIATION OF MUNICIPAL ELECTRICIANS. President, Lawrence Stone, Denver, Col.

SOCIETY FOR ELECTRICAL DEVELOPMENT, INC. General manager, J. M. Wakeman, 29 West 39th St., New York.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Dean F. L. Bishop, University of Pittsburgh, Pittsburgh, Pa. Annual meeting, Evanston, Ill., June, 1918.

SOUTH DAKOTA ELECTRICAL POWER ASSOCIATION. Secretary-treasurer, Frederick D. Brown, Huron, S. D. Convention, Sioux Falls, S. D., May 15 and 16.

SOUTHEASTERN SECTION, N. E. L. A. Secretary-treasurer, T. W. Peters, Columbus, Ga. Annual meeting, June 19-20, Atlanta.

SOUTHERN CALIFORNIA ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary-treasurer, J. E. Wilson, 425 Consolidated Realty Building, Los Angeles, Cal.

SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION. Secretary, H. S. Cooper, 403-4 Slaughter Building, Dallas, Tex.

SOUTHWESTERN SOCIETY OF ENGINEERS. Secretary, C. E. Bargebaugh, 703 First National Bank Building, El Paso, Tex.

TEXAS STATE ASSOCIATION OF ELECTRICAL CONTRACTORS. Secretary, H. S. Ashley, Fort Worth, Tex. Annual meeting, Galveston, Tex., June 15, 1918.

TORONTO ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, J. E. Myers, 3 Gould St., Toronto, Ont.

TRI-STATE WATER AND LIGHT ASSOCIATION. Secretary-treasurer, W. F. Steiglitz, Columbia, S. C.

VERMONT ELECTRICAL ASSOCIATION. Secretary-treasurer, C. H. West, Rutland, Va.

VIRGINIA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, E. M. Andrews, Richmond.

WESTERN ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary, W. S. Boyd, 175 W. Jackson Blvd., Chicago.

WESTERN SOCIETY OF ENGINEERS, ELECTRICAL SECTION. Secretary, E. S. Nethercutt, 1735 Monadnock Block, Chicago.

WISCONSIN ELECTRICAL ASSOCIATION. Secretary, J. P. Pulliam, Green Bay, Wis.

WISCONSIN ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, J. C. Staff, 578 Jackson St., Milwaukee, Wis.

(Closed April 16, 1918.)

- 1,262,652. TELEPHONE EXCHANGE; Henry P. Clausen, Mount Vernon, N. Y. App. filed Sept. 11, 1917. Improvements.
- 1,262,651. AUTOMATIC CIRCUIT BREAKER FOR CON. CONTROLLED TELEPHONE SYSTEMS; Hirschel M. Connor and Don D. Miles, San Francisco, Cal. App. filed Feb. 20, 1917. Improvements.
- 1,262,618. TELEGRAPH SYSTEM; Oscar A. Danielson, Plainfield, N. J. App. filed May 2, 1917. For repeating telegraphic signals.
- 1,262,641. AUTOMOBILE-DOOR LATCH; Ernest S. David, Sterling, Ill. App. filed March 21, 1916. Improvements.
- 1,262,653. PROCESS AND APPARATUS FOR AUTOGENOUS WELDING; Pietro de Paolini, Milan, Italy. App. filed Aug. 24, 1916. Improvements.

1,262,749—Automatic Welding Machine

- 1,262,654. SELECTING SYSTEM; Amos F. Dixon, Newark, N. J. App. filed Sept. 30, 1915. For use in printing telegraph communication.
- 1,262,655. SELECTING SYSTEM; Amos F. Dixon, Newark, N. J. App. filed Sept. 30, 1915. For use in printing telegraph systems.
- 1,262,683. ELECTRIC FUSE; Robert A. Lewis and Edwin C. Weisgerber, Pittsburgh, Pa. App. filed Dec. 1, 1916. Detector indicates whether or not the fusible element has been blown.

- 1,262,784. INSULATING SUPPORT; Arthur J. Hall, Wilkinsburg, Pa. App. filed June 8, 1917. Improvement.
- 1,262,802. LAMP SUPPORT; George T. Irwin, Toronto, Ontario, Canada. App. filed Dec. 2, 1915. Improvements.
- 1,262,805. AUXILIARY SIGNAL; Harry L. Kaser, Canton, Ohio. App. filed Oct. 28, 1916. Improvements.

Record of Electrical Patents

Notes on United States Patents

- 1,262,824. SPEED CONTROL FOR INDUCTION MOTORS; Frederick W. Meyer, Pittsburgh, Pa. App. filed June 20, 1914. Speed may be controlled throughout a wide range.
- 1,262,831. ELEVATOR SAFETY DEVICE; George Nissenson, New York, N. Y. App. filed Oct. 8, 1915. For controlling and starting a water, steam or otherwise operated elevator machine.
- 1,262,838. ELECTROMAGNETIC APPARATUS; Frederick P. Poole, La. Grange, Ill. App. filed April 11, 1917. Energizing winding may be accurately located and positively secured in definite relation to the end of its core.
- 1,262,843. AUTOMATIC TELEPHONE SYSTEM; Arthur J. Ray, Chicago, Ill. App. filed June 16, 1913. Improved means for handling long-distance calls.
- 1,262,861. SECONDARY FUSE BLOCK; Andrew F. Sproul, Oakland, Cal. App. filed Jan. 29, 1917. Cheaply constructed device which is positive in action and may be easily repaired.
- 1,262,895. ELECTROMAGNETIC CONTROL SWITCH; George S. Wood, New York, N. Y. App. filed May 3, 1917. Improvements.
- 1,262,912. MEANS FOR PREVENTING DISTURBANCES IN SUBSTATION TELEPHONE SETS. App. filed Dec. 22, 1916. Improvements.
- 1,262,914. SYSTEM OF DISTRIBUTION; Joseph Bijur, New York, N. Y. App. filed Dec. 21, 1910. For electric lighting of railway vehicles.
- 1,262,916. CONTROLLING DEVICE FOR SELF-FOCUSING ELECTRIC-ARC LAMPS; John L. Boyle, Boston, Mass. App. filed Jan. 13, 1913. Arc automatically maintained at a predetermined point.
- 1,262,917. REGULATOR FOR CHARGING STORAGE BATTERIES; Stephen F. Briggs, Milwaukee, Wis. App. filed Feb. 12, 1915. Improvements.
- 1,262,936. ELECTRIC LAMP; Frank L. Fowler, Philadelphia, Pa. App. filed June 17, 1916. Interlocks the lamp bulb with its base.
- 1,262,964. PORTABLE LAMP; Harrison D. McFaddin, East Orange, N. J. App. filed March 12, 1915. Clamping mechanism for detachably securing a lamp to the arm of a chair, bedpost or other support; an improved shadeholder which permits of the shade being readily tilted or adjusted as desired.
- 1,262,969. KEY SOCKET; Harry J. Morey, Syracuse, N. Y. App. filed Aug. 3, 1916. Fixed and moving parts of the device are held on the single-piece porcelain base.
- 1,262,988. SWITCH BOX; Clarence M. Siefert, Evansville, Ind. App. filed Dec. 5, 1916. Improvements.
- 1,263,005. LOW-TENSION SPARK PLUG. App. filed Sept. 21, 1916. For internal combustion engines.
- 1,263,010. SEMI-AUTOMATIC TELEPHONE SYSTEM; Bernard D. Willis, Chicago, Ill. App. filed Oct. 14, 1913. Improved trunking arrangement.
- 1,263,013. TELEPHONE METER-SERVICE SYSTEM; George A. Yanochowski, Chicago, Ill. App. filed Sept. 2, 1915. Improvements.
- 1,263,021. HEATING DEVICE; Alexander Bender, Chicago, Ill. App. filed Feb. 11, 1918. Structure to which an electrical iron can be readily secured and which has radiating walls for throwing off into the room the heat received from the iron.
- 1,263,028. SECTION INSULATOR AND SWITCH; Newton K. Bowman, Canton, Ohio. App. filed March 9, 1917. Insures perfect insulation of the sections when the switch is open and perfect contact when the switch is closed.

- 1,263,039. ELECTRICAL RESISTANCE; John G. Clemens, Buffalo, N. Y. App. filed Sept. 29, 1917. Resistance to passage of current will gradually decrease as it becomes heated.
- 1,263,050. CONNECTING DEVICE WITH INSULATORS; Arthur H. Fargo, Wilmington, Del. App. filed April 4, 1914. Adapted to be connected to a ground pipe.
- 1,263,069. TELEPHONE-EXCHANGE SYSTEM; Charles W. Kceider, Newark, N. Y. App. filed July 12, 1917. Impossible to establish a connection between two telephone lines using portions of two connecting circuits.
- 1,263,073. SIGNALING DEVICE; August J. Kaloneck, New York, N. Y. App. filed Jan. 28, 1914. For producing high-frequency electrical currents.
- 1,263,078. INDUCTION MOTOR; Justin Lebovici, Oakley, Ohio. App. filed May 14, 1917. Secondary windings adapted for reconnection after starting.
- 1,263,083. TELEPHONE-EXCHANGE SYSTEM; Alben E. Lundell, New York, N. Y. App. filed Aug. 16, 1916. A line in trouble may be cared for.
- 1,263,140. TELEPHONE TRANSMITTER; Lonnie B. Stone, Louisville, Ky. App. filed April 4, 1914. Improvements.
- 1,263,150. RECIPROCATING SAFETY SWITCH; Horatio S. Tittle, San Francisco, Cal. App. filed Nov. 27, 1916. For delivering a current to the apparatus to be started without the current passing through the fuses during the starting period.
- 1,263,181. ELECTRIC STOVE; Stover C. Wingler, Los Angeles, Cal. App. filed Dec. 11, 1917. Simple means for regulating the heat.
- 1,263,190. THERMOSTATIC CIRCUIT CLOSER; Albert I. Bennett, Fort Atkinson, Wis. App. filed April 14, 1917. Electric automatic fire alarm.
- 1,263,204. APPARATUS FOR RECEIVING ELECTRICAL OSCILLATIONS; Elmer E. Butcher, Interlaken, N. J. App. filed May 14, 1914. Improvements.
- 1,263,247. ELECTRIC CONTACT DEVICE; Gottlob Honold, Stuttgart, Germany. App. filed July 21, 1917. Mechanically controlled interrupter for use with the ignition devices of internal-combustion motors.
- 1,263,280. SPEED ALARM FOR AUTOVEHICLES; Peter E. Paulson, Eastedge, N. D. App. filed April 20, 1915. Means for sounding a bell alarm when the speed limit is exceeded.
- 1,263,292. BIAS-FABRIC ASSEMBLING TABLE; William C. Stevens, Akron, Ohio. App. filed May 20, 1916. Improvements.

1,263,078—Induction Motor

- 1,263,308. MEASURING APPARATUS; William H. Bristol, Waterbury, Conn. App. filed June 22, 1917. Single pointer operates over a chart to produce a multiplicity of records of separate and distinct operations.
- 1,263,314. APPARATUS FOR ELECTROLYSIS; Philip A. Emanuel, Aiken, S. C. App. filed Dec. 24, 1917. Improvements.
- 1,263,344. ELECTRIC SWITCH; Carl Bramming, Chicago, Ill. App. filed Feb. 19, 1917. Single and compact device.
- 1,263,350. ELECTRIC HEATER; George J. Schneider, Detroit, Mich. App. filed Dec. 31, 1908. Improvements.
- 1,263,351. ELECTRIC HEATER; George J. Schneider, Detroit, Mich. App. filed Dec. 31, 1908. Improvement.

Number 19

Interconnection of Generating Systems Important

WE HAVE so often preached the desirability of physical connection between adjacent generating plants that under ordinary circumstances it would hardly seem necessary to call attention again to its obvious advantages, but the lessons of the last winter and industrial conditions that are rapidly arising impress the need of going further than ever before in the matter of interconnection. The coal problem is still far from completely solved. In fact, the situation may at any time take on an acute phase, so that no plant can feel absolutely secure as regards its fuel supply or its ability to insure continuity of service under all the conditions that may arise. Would it not be wise, therefore, to undertake some concerted action for comprehensive emergency interconnections, so that any station which is through its distribution within reach of another station should make provision for the exchange of current and make it in advance of a sudden necessity?

Numerous cases may arise in which this step would be of very great advantage. Industrial power in considerable amount may be required, for instance, from a plant which is not readily able to supply the added load on short notice. If it is able promptly to borrow energy from a neighbor, work can go ahead speedily; if it has to wait in these strenuous days until new machinery can be installed, important manufactures may be held up. Again, a station with a widespread distribution may require similar assistance from a more conveniently situated neighbor to avoid the investment and loss of time required to reinforce its feeders. A plant may readily be caught in a temporary coal shortage when two or three days of assistance would suffice to tide over the emergency without inconvenience to anybody.

Big plants and small plants alike may need help often on very short notice. Most stations now run a twenty-four-hour service, but there are some small ones which are not conveniently equipped to do so and therefore would be at least temporarily unable to deliver power for manufacturers which otherwise could be profitably handled. The power load is assuming every month great and greater importance. Factories are often situated with reference to considerations more important than power supply, and their needs should be met if possible. The obvious step would seem to be a thoroughly systematized effort at interconnection between adjacent territories. There is a strong enough spirit of comity in these days to enable arrangements of this kind to be made without much difficulty, and the

main thing is to make them promptly and to carry out the necessary construction so that if help becomes of vital importance it can be obtained at once. There are innumerable places where with comparatively small expenditure this plan could be carried out, but in most instances it demands material and labor that cannot be summoned on the spur of the moment. Here is a good field for the activities of the National Electric Light Association, which has already done so much in securing united and efficient action for the public service.

Predicting the Residence Load

PREDICTING from past experience the probable growth of load on residence circuits is not so easy. The general method applied by P. O. Reyneau in this issue is substantially that which he has already used in other classes of lighting. He builds up a working curve by adding graphically the sums of the monthly maximum averaged over three years, giving thus a general view of the variations of the past from month to month. For convenience the values from the curves are reduced to a table of percentages in which the load for each month appears as a percentage of the load for every other month in the year. Then, knowing the present load for any given month, one has fairly sound data on which to predict the probable value of the load in some future month. The precision of this prediction of course depends on the reliability of the rate of growth established by the periods entering into the average.

Motor Drive for Woodworking Machines

EVERY sort of machinery has its own idiosyncrasies when one comes to adapt it to electric drive. David R. Shearer's paper in the current issue takes up the situation regarding the application of motors to individual woodworking machines. The general peculiarity of many of these is that the load is irregularly periodic, very heavy at times and light during the intervening periods of inactivity. The tendency in fitting out equipment of this character with electric motors has been to overpower the outfit to a very considerable extent. Group driving reduces the general amount of overloading but does not free the motor from the danger of an aggregate peak as in the case of any group of irregularly loaded machines. Now and then all the loads fall upon the group motor simultaneously, with a fairly good chance of putting it out of service. The remedy is precisely the same in this

case as in that most aggravated example of irregular load, the rolling mill; that is, the installation of a fly-wheel heavy enough to help out the motor during the brief periods of heavy demand and in storing up energy between peaks for the next effort.

Our contributor's load curves, derived from actual practice, put the case in the clearest possible terms. It is shown that it is perfectly possible to get a very heavy peak, say four times the average load, out of three quite innocent-looking components. The installation of a flywheel on any single machine produces an immediate and striking effect in smoothing out the load curve. In the example shown the peaks occurring at periods of ten or twelve seconds were brought down to less than two-thirds of their ordinary value, a result which not only is gratifying with respect to the size of motor necessary to install but produces a most salutary result on the power demand from the system at large. With the fairly heavy motor from which these curves were taken the sudden variations in demands for power would be quite sufficient to disturb very seriously the regulation of anything except a large generating plant. With the flywheel working the peaks become relatively inconsequential and the load is very much softened. The case is one which may be found, too, in various other branches of industry in which there are frequent and sharp increases in load. A fairly heavy flywheel, designed with reference to the work to be done, affords a highly successful remedy for these irregularities and not only diminishes the size of motor necessary to install but renders its operation much easier for the plant and saves possible overheating and stalling of the motor itself.

First Fruits of Daylight Saving

THE actual result of daylight saving is something almost impossible to predict save in the most general way. Previous experience abroad has shown that the reduction in demand for energy has been a measurable but very uncertain quantity, varying considerably from place to place. Our readers will therefore welcome a group of load curves obtained from stations in the Middle West showing roughly the actual results thus far obtained in carrying out the daylight-saving program. They apply, of course, to the first month of the new schedule, April, during which the conditions were not yet steadied by every-day experience with the new régime, and when the actual hours of sunrise and sunset had not reached their extreme positions. The main showing thus far is that the reduction in output is of the order of magnitude of 5 per cent for this particular month. This implies, of course, a greater reduction in gross revenue from the fact that the deficit comes out of the lighting rate, which is relatively high.

As respects the load curve of the station, daylight saving has created a new valley in the lighting between 5 and 8 o'clock p. m. The short span of this valley tends to lessen the actual saving in coal, since a large part of the boiler capacity will have to be carried over it ready for service. On the other hand, there has been in some instances a slight increase in the daily load factor which probably is of small significance. The annual load factor will be upon the whole

somewhat reduced, to the injury of costs of production. It will be interesting to follow the changes in load as time goes on. For a guess, there will be no striking change for several months to come; but during late September and October the conditions should produce a considerable lessening of the evening valley and the addition of a morning peak. Were the daylight-saving plan carried throughout the year the chances would be good for an improvement in the annual load curve, and particularly that portion of it which lies in the winter months. It would not be surprising, indeed, to see the requirements of energy for lighting through October tending in some material degree to offset the earlier losses. We can only tell by watching just what is going to happen, but it is fairly evident that the saving in fuel is going to be small compared with the possible loss of revenue; that the latter probably will not be so large in the total as has been expected, owing to the effect of the later portion of the daylight-saving period, and that the benefits secured to the public are not to be reckoned so much in the saving of lighting bills as in the advantage to be gained by the added hours of out-of-doors freedom.

Economies of Higher Steam Pressures

WITH the rising price of coal the necessity of its economical use in central stations becomes daily more imperative. The electric generator itself has been pushed pretty nearly to its ultimate efficiency. For example, when a generator is giving 95 per cent efficiency at or near full load the chances of improvement to any material degree whatever are obviously negligible. One must look somewhere else in the line of transformation for a chance to make savings. The mechanical power plant offers this opportunity, from the boilers to the shaft that spins the generator. Within a recent period this journal has published important notes on the savings to be made by larger and better boiler units, by increased vacuum, by saving of waste heat in the piping, and by increasing both pressures and superheat in the steam system. In the current issue J. T. Foster gives the results of a study of the relation of steam pressures to economy, particularly economy of the dollars and cents variety.

That raising the steam pressure increases the thermal efficiency of the prime mover admits of no dispute. Furthermore, it does so to a determinate extent which can be computed with a very satisfactory degree of precision; but as a matter of fact engineers have been very cautious in raising pressures, chiefly for the reason that equipment is not "standard" for pressures materially above 200 lb. (14 kg. per sq. cm.), and, as everybody knows, a request for variation from so-called standards is immediately followed by a punitive expedition in force from the estimating department of the manufacturer. But, as practice has crawled upward from the square-stayed boilers of the olden times and pressures not much higher than those in a vapor-heating system to highly organized water-tube installations at 200 lb. or more per square inch (14 kg. and up), so advance is bound to come from these latter conditions up to the point at which the cost of equipment for added pressure counterbalances the saving to be made, a point which is ever creeping upward as costs of

fuel rise. Mr. Foster's paper gives a very convenient practical method of investigating the economic conditions accompanying increased steam pressure. As a matter of fact, added superheat generally goes with steam pressure, also the best vacuum which is commercially obtainable, but the pressure item alone shows large savings.

The difficult thing to estimate in this, as in all similar cases, is the probable increase of the total cost of the plant in going, say, from 200-lb. to 500-lb. (14-kg. to 35-kg.) normal pressure. We are inclined to think that Mr. Foster's estimates in this particular are somewhat lower than they would run at the present moment, but in more normal times they would sound very reasonable. At all events, these suggestions mark a move in the right direction, as we indicated not long ago in describing the Joliet plant to which Mr. Foster refers. The steam turbine has probably not yet reached its ultimate efficiency in the same sense that the dynamo has, yet it has certainly developed to a point where mere increase of output is not likely to better things materially. There is still room for considerable improvement in boiler plants, chiefly through increase of working capacity. The condenser is fairly near its limits, so that the opportunity for saving lies in superheat and in steam pressure.

The Precise Measurement of Alternating Currents

IN THE electrical engineering laboratory the measurement of continuous currents has ordinarily a higher degree of precision than the measurement of alternating currents. This is for the reason that continuous-current precision measurements commonly employ null methods, whereas alternating-current precision measurements commonly employ deflection methods. The potentiometer, essentially a null-method instrument, is very generally employed in continuous-current work; but although the alternating-current potentiometer exists, it is relatively little known.

The ordinary electro-dynamometer for measuring alternating currents is essentially a deflection instrument. Either the scale deflection produced by an alternating current is compared with a similar scale deflection produced by a known continuous current or the deflections are in turn reduced to zero through the application of a scale-measured torque. This scale-reading use of the instrument necessarily limits the precision of its use. The article by C. O. Gibbon in this number describes an interesting and novel use of the dynamometer whereby the torque produced by an

alternating current is balanced against the opposing torque produced by a measured continuous current, thereby employing the instrument in a null method and enabling the degree of alternating-current precision to be raised nearly to that of the continuous-current measurement involved. The idea originated in the Bureau of Standards and has been actually tested in a dynamometer especially wound for the purpose. The results obtained indicate that by the use of the null dynamometer about one part in eight hundred could be secured, on the average, or nearly the third order of precision. When, however, certain improvements shall have been made in the instrument it is hoped that the fourth order, or one part in ten thousand, may be approached. We understand that the instrument has been already carried to a further stage of development since the article now printed was written.

The null dynamometer measures the root mean square of a complex harmonic alternating current in terms of the root mean square, or stationary value, of a measured continuous current. It is actually difficult to obtain a check measurement of the instrument unless, as is described in the article, a simple harmonic alternating current, or pure sine wave current, is very nearly realized for the purpose. In such a case the Drysdale a.c.-d.c. potentiometer enables a check to be secured. It seems likely, however, that the precision of the null dynamometer can be made even superior to that of the Drysdale a.c.-d.c. potentiometer, so that an accurate determination of the null dynamometer's precision may be difficult to obtain. However, other direct-current potentiometers are being developed, and the prospects are therefore good of eventually securing almost as high a degree of precision for complex harmonic alternating-current measurement as is already obtainable for continuous currents.

The easiest application of the null-dynamometer principle is to the measurement of alternating currents of the order of a few centiamperes. This is for the reason that the suspended coil can then receive its current supply through thin suspension wires, which have relatively little torsional moment. The amount of unbalanced electromagnetic torque giving rise to a noticeable deflection from zero is therefore small, and the balancing precision becomes correspondingly high. As the current strength that has to be carried to the suspended coil is increased, the difficulty of securing small torsional moment at the zero point increases likewise. If, however, the null dynamometer wins favor in the electrical engineering laboratory for centiampere measurements, it seems likely that improvements in design will make it similarly useful for ampere measurements.

THE scarcity of fuel during the past winter, the possible repetition of such a condition next winter and the recent order regarding the distribution of coal make it especially important that all companies depending on fuel for power generation should arrange to exchange ideas on the economical utilization of low-grade coals. Some light will be thrown on this subject by an article which we will present shortly outlining experiences in the Northwest with powdered coal. Another subject which is becoming of greater importance as electric service systems and generating units become larger is that

The Coming Issues

of the phenomenon which takes place when sudden short circuits occur. Prof. N. S. Diamant will discuss this subject in an early issue, giving a thorough, critical and relatively simple explanation of the action that takes place. Efficiency in the meter department and how one company remodeled its system to carry increased loads are other subjects that will be discussed. A map of the United States showing the coal zones as prescribed by the Fuel Administration will be presented with the ELECTRICAL WORLD as a colored supplement in connection with the Fuel Administration's order.

Value of Flywheels in Woodworking

They Have Proved Especially Desirable in Plants Where Individual Motor Drives Are Installed—Permit Using Smaller Motors, Improve Load Factor, Power Factor and Efficiency, and Relieve Equipment of Stresses

BY DAVID R. SHEARER

OWING to the fluctuations in load obtained with certain kinds of woodworking machinery, it has frequently been the practice to over-motor the machines in order to carry the peak loads. As a result the load factor, the power factor and the over-all motor efficiency have been detrimentally affected and more than the necessary outlay of money has had to be invested.

In several instances the writer has found that the average load on a given woodworking machine is only 50 per cent of the installed motor capacity and that some load peaks run as high as 100 per cent above the motor rating. In other words, some peaks occur which are four times the average load.

If the first cost of the motors were the only factor to be considered, much larger motors than are demanded by the machines might not be so objectionable; but the fact that any motor operating much below its rating will not operate at its maximum efficiency throws a different light on the subject. In the case of induction motors the power factor decreases with the load so that the system may be seriously disturbed if the motors are underloaded, especially if fed by a small local or isolated plant. The highest efficiency is usually obtained from an induction motor at full-load rating and the highest power factor at slight overloads. With one standard motor of the induction type the efficiency dropped 2 per cent from full load to half load, and the power factor dropped 12 per cent with the same decrease in load. Below half load the results are still more serious.

On account of the trouble experienced with some motor-driven woodworking machines in the past, some apprehension has arisen regarding the advantages of individual drive which should be dispelled, inasmuch

FIG. 1—LOAD CURVE OF A GANG-EDGER OPERATING ON GREEN LUMBER WITH AND WITHOUT A 1500-LB. (680-KG.) FLYWHEEL

The motor driving this machine is rated at 60 hp. and is directly connected to operate at a speed of 1800 r.p.m. on 440-volt, three-phase energy supplied by an isolated plant. The operating conditions were practically the same in both tests so that the value of the flywheel can be readily observed. Without the flywheel the demand increased above the maximum capacity of the motor for an instant. It caused excessive heating and sometimes stalled the machine. After the flywheel was attached the motor was operated at a lower temperature and never stalled during periods of heavier cutting.

as the trouble has generally been caused by improper application of the motor. So strong has been this objection that in some instances the individual drive has been taken out and group drive substituted so that the machine peaks could be carried by the overload ca-

capacity of a larger motor. This method of drive may be the correct thing in some cases, but is less desirable than the individual drive on account of the necessary shafting and belting with the attendant losses in efficiency. Furthermore, the group-drive motor may be subjected to concurrent peaks (Fig. 2) which may

FIG. 2—INDIVIDUAL POWER-DEMAND CURVES OF THREE MOTORS WITH THE GROUP DEMAND PLOTTED ABOVE

None of these machines was equipped with a flywheel. The curves show that a concurrent group peak is possible which may require over-motoring of the group when flywheels are not used. In the plant at which these tests were conducted a total plant concurrent peak occurred on an average twice in ten hours.

pull it out of step, thus shutting down the whole installation and causing serious delay.

The simplest and cheapest way to obviate pronounced peaks is to install individual flywheels on the motor shafts of each machine and retain the advantages of the individual drive. With this arrangement the loads can be carried by motors considerably lower in rating than would be required if flywheels were not used, and in addition the motors will operate more nearly at normal load. Of course, the flywheel must be especially designed for each machine as the operating characteristics vary considerably.

The duration of the cut and the period during which the machine is running idle are the principal factors which should determine the flywheel effect necessary. As an example, the duration of a trimmer cut is very short, while the idle period is slightly longer. A slasher cut is similar to that of a trimmer, but considerably more power may be required when a butt slab is being cut. A gang-edger cut is considerably longer than either of the foregoing operations. A short interval exists between cuts which must be taken into consideration in the design of the flywheel and in deciding upon the size of driving motor to install.

Sometimes it is convenient to test the instantaneous power demands on the machine while operating it from a motor somewhat larger than is necessary. From these tests the average load and maximum peaks can be determined. If the test results are plotted as curves, it is comparatively easy to decide how many foot-pounds must be added to the motor power during peaks by a flywheel to bring the power demand on the motor down to a desirable value. During the period when the machine is not cutting the motor stores energy in the flywheel, which can later be used while the tool is cutting.

Another factor to consider when using flywheels is

the rotor resistance of the driving motor when it is of the three-phase induction type. As the rotor resistance is increased the slip will increase, allowing a greater reduction of speed under heavy load and thus permitting the flywheel to give up some of its stored energy. If the load surges are frequent and pronounced, this characteristic of the motor tends to minimize the line disturbances, but if the peaks are of long duration a high-resistance rotor will allow the speed of the machine to drop too low for the proper action of the cutting knives or saws.

MACHINES ON WHICH FLYWHEELS ARE MOST DESIRABLE

The woodworking machines on which it is most necessary and economical to install flywheels, when operated by individual motor drive, include circular rip and cut-off saws, edgers, trimmers, slashers, timber trimmers, some types of planers and flooring machines, "hogs," and in general any machine which has periodic loads and periods of non-production. Flywheels are not of much advantage on band saws, because these machines

usually have sufficient flywheel effect in the band wheels which carry the saw.

As the friction load of any woodworking machine is practically constant, it is advisable to determine this load first, then the average power necessary to do the actual cutting. These two factors will determine the motor size if a flywheel is used to reduce the peaks to a value which can be handled by the overload capacity of the motor.

As a result of the tests indicated by Figs. 1 and 2 and others made upon different woodworking machines the writer has come to the conclusion that better results would be secured with individual drive by the more general use of suitably designed flywheels. The necessary generating plant capacity would be decreased, the size of the individual motors could be reduced, the load factor would be improved, the efficiency increased and the power factor raised. Furthermore, flywheels will relieve the motors and starters from excessive stresses occasioned by the pronounced surges of power demand.

Predicting Load on Residence Circuits

Data Which Assist in Making Intelligent Estimates of Future Requirements on Feeders Carrying Residence and Store Lighting Loads, Including Table Showing Ratio of Each Month's Load to Load of Remaining Months

BY P. O. REYNEAU

Distribution Engineer Detroit Edison Company*

IF THE demands for electric service which are made each year are to be met economically, they must be anticipated far enough in advance to enable provisions to be made for serving them when it is most economical to do so. About the only way to make intelligent estimates of future requirements is to couple an analysis of past rates of load increase with a far-sighted judgment which will take into account the effect of future conditions on the past rate of growth.

Predicting the load on circuits carrying a load consisting of residence and store lighting is usually simplified by the fact that the growth is relatively constant and that the other factors that come in to modify the estimates can be analyzed and allowance can be made for them.

In the following it will be shown how an analysis of the conditions causing the increase has been attempted for a number of single-phase circuits fed by 200,000-circ. mil. underground cables and No. 0 or No. 0000 overhead wires.

The data available for such a study consist of a set of curves, one for each circuit, showing the monthly maxima over a period from September, 1914, to the present time. These curves are not all of the same outline, yet there are certain characteristics appertaining to all which could be expressed in one curve to be considered typical. A typical curve would serve as a fairly firm foundation on which to base estimates for the future.

The changes in circuit loads shown by an inspection of the monthly maxima are caused by a number of

easily defined factors. The first is a seasonal condition due to the change in the length of days and the result of cold weather keeping people indoors; the second is an increase in the use of electricity by each customer caused by the greater appreciation of the uses of electrical energy in the home; the third is due to increase of population within the boundaries of each circuit; the fourth is due to the embracing of new territory by the circuit or to the loss of old caused by switching of load on account of overload or other operating necessities.

The first two factors are constants in their own particular sense—that is to say, the rate of increase due to these factors is a fairly constant value—and the third is partly so, for it may be subdivided into two, the factor of normal increase in population and that of abnormal increase. Normal increase will be encountered in practically every section of the city, abnormal only in sections not yet closely built up and to which people are attracted by real estate activity or the circumstances of industrial development. The fourth factor is a result of the preceding three and must be considered as indefinite, as it appears both for and against increases of load. It is a factor, however, for which correction may be made, since its use lies within the control of the operating company.

The ordinates of curve I are proportionate to the sums of the maxima monthly loads on the circuits averaged over three years. It was considered that the indeterminate factor of changes in territory would not affect the curve, inasmuch as they appeared in different circuits at different times of the year and their effect would be reduced to a comparatively small value with

*Assisted by Frank R. Innes.

an average equal effect on all the ordinates of the curve, in view of the long period of time covered. This assumption is borne out by the comparison of curve I with curve II. This last curve covers a period of only one year—September, 1916, to September, 1917—and was corrected for changes in territory. The corrections were made by deducting from the totals of each month the amount representing the load in the same territory appearing in two circuits in the same month. This condition of duplication of load is due to the fact that when a change in boundary for the relief of any

TYPICAL CURVES TO SHOW INCREASE IN MONTHLY MAXIMA

circuit is made the load on the section cut off appears in the maxima of both the circuits relieved and relieving. It would be possible naturally to take a well-built-up district including several circuits and establish a curve showing the growth per year of that nature of load, leaving the new circuits with abnormal growth for a special study. This refinement is hardly necessary, as the percentage of growth would not be much diminished. In the method used here there is introduced a small factor of safety.

In order to make the curve more easily applicable it has been reduced to a table of percentages in which the load for each month in the year appears as a percentage of every other month in the year. It is possible by the use of this table to take the load on any circuit for any given month and predict on that circuit the load for any future date, always considering that the boundaries of the circuit remain unchanged and that there are no particular conditions in that circuit which will cause an abnormal increase or decrease in the load.

It is not the intention that this curve, or the percentage table developed from it, shall figure as an absolute method for estimating future loads, but merely as a basis on which are to be imposed the particular conditions obtaining for each territory under consideration. The table contains no allowances for abnormal conditions, and the results derived from it may in some cases have to be considerably modified by such conditions as changing of circuit boundaries, rapid increase in rate of settlement and others. However, the table is sufficiently accurate to serve as a basis in estimates on the necessity for future work, unless the speed of growth of the city is greatly diminished or increased from the average rate maintained for the past three years.

The table gives the load on any circuit for any month in terms of any other month, and by correct selection of factors it is possible to predict with reasonable accuracy the future maximum load in amperes on any circuit if a present or previous reading on that circuit is given. For example, the November, 1917, load on a circuit is 223 amp., and it is desired to estimate

its load for January, 1919. Taking the November load as 1 in the table, the load for the following September is 0.993 of the November load; then taking this September load as 1, the load for the following January is 1.23 of this calculated September load. In this case, therefore, the January, 1919, maximum load of this circuit will be $223 \times 0.993 \times 1.23 = 272$ amp. This table should be read downward for predicting future load, upward if past loads are to be determined.

Having established a table for predicting the load on any circuit, this table is used, corrected as explained above for factors beyond its scope, for laying out new circuits for the coming year. It means providing substation capacity, switches, cable and overhead feeders and the primary wire necessary for the changes in boundaries. A map is made showing the circuit outline and indicating the estimated load for the coming year for each circuit. It is used for determining the best location for the new circuits. A careful examination is made of the circuit boundaries with a view to finding the best places for tying in or separating the primaries of the old circuits and of the new circuits to be installed. Up-to-date maps of the distribution system are of great value in this work. After analysis it is usually found that there are, owing to street or alley conditions, boulevards, railroads and other physical conditions, natural boundary lines, and that the best economy will be reached by using them. It is also advisable to look ahead as much as possible beyond the one year increase and so handle the work that new boundaries can be easily established later. The table is also used to determine at what time it is possible to do the necessary temporary transferring of territory that will ultimately permit the establishment of the boundaries as planned for the time of peak load.

Perhaps the most important factor from the economical standpoint is the proper loading of each circuit feeder. Residence and store lighting load has a very low load factor and reaches its maximum for only a few weeks every year. It is therefore very important to limit as much as possible the investment required

RATIO OF EACH MONTH'S LOAD TO THE TOTAL LOAD FOR THE REMAINING MONTHS OF THE YEAR

for its handling. Having established an average maximum load allowance on the underground cable and made provisions as desired for maintaining standard quality and continuity of service, the table above described and the analysis of circuit conditions are a means of providing for the coming year an adequate load on every circuit so that the equipment will work as near as possible to maximum efficiency. The matter of quality and continuity of service is beyond the scope of this paper. It can be briefly said that the reliability

the service all along the line from the power house to the service taps of the individual consumer, and especially the reliability of the underground cable and of the overhead feeder, will determine the required throw-over facilities that will give satisfactory service.

It is of interest to note that the maximum average load in the last three years has increased 27 per cent, the total number of circuits increasing 75 per cent. The allowable average maximum has not been reached yet, but it is hoped that it may be reached in the future. It can be truly said that such condition would represent the highest efficiency obtainable under the given condition.

PROTECTING INTERESTS OF OWNERS OF SMALL COMPANY

Turners Falls Power & Electric Company Makes Contract for Purchase of Amherst Substation with Provisions Carefully Prepared

TO PROTECT the interests of stockholders in the Amherst (Mass.) Gas Company, which owned a 1525-kva. substation supplied with energy by the Turners Falls Power & Electric Company, an interesting procedure recently took place in connection with a transfer of the substation to the power company. Philip Cabot of Boston is president of both companies, but the stockholders are not the same, though the two companies have the same management.

With the growth of the Turners Falls system of hydroelectric supply in the central Connecticut Valley, it appeared desirable to the management that the substation should be sold to the larger company and a new contract executed for electrical supply. Instead of taking action along this line, the management called a special meeting of stockholders to consider the advisability of selling the substation to the Turners Falls company, and a committee was appointed to investigate and report upon the matter.

The committee reported unanimously in favor of the sale of the substation at its book value (about \$145,000, including three small tenements for operators), pointing out that this price represents the total original cost of the plant and equipment without deduction for depreciation or obsolescence. The committee held that the gain in the financial strength of the gas company through the cancellation of approximately \$145,000 floating debt in this way would result ultimately in a far greater benefit to the stockholders than the privilege of receiving in the future stock rights of problematical value.

Under the gas company ownership of the substation, energy was received from the power company at the full value of the substation. Under the new ownership the plan is for the gas company to receive energy at the full substation value, involving a new contract and affording a good opportunity for the gas company to require the Turners Falls company to adjust the price for the electrical energy sold to it on a more equitable basis when compared with prices paid by other public lighting companies and municipal plants.

It was pointed out that if the Turners Falls company thus obtained a practically modern substation at a price materially below the present cost of building, it

ought at the same time to be willing to place the gas company in as favorable a position with regard to rates as it does other central stations of equal size in the Connecticut Valley.

The report stated that unless a satisfactory contract for the delivery of electrical energy under the new conditions could be obtained it might be advisable to hold the substation and to continue to operate under the previous terms. The committee recommended that the life of the contract should be at least fifteen years; that the basic price for energy should be not over 1.25 cents as compared with 1.5 cents per kilowatt-hour; that any coal clause should operate only between July 1 and Dec. 1 of each year, should be drafted upon a basic

price for coal of not more than \$4.50 per ton and should contain a provision that in no event should the price of electrical energy delivered exceed 1.5 cents, and that so far as possible payments, including settlements on account of coal charges, should be made monthly. The method of determining the true cost of coal from time to time, the committee felt, should be left to the management.

A new contract was executed between the companies as recommended, including the transfer of the substation as a part of the proceedings incidental to the investigation. An estimate was prepared of the cost of reproducing the substation under 1917 prices. This totaled \$160,300 (about \$105 per kva.) and is detailed in the tabulation printed here, as prepared by the engineers of the Turners Falls company.

The Effect of Daylight Saving on Load

Data and Curves Showing How the Daylight-Saving Law Affects Typical Central Stations in the Middle West—No Large Coal Saving—Creation of a New Evening Valley

IT IS difficult at this time to predict accurately what ultimate effect the daylight-saving law will have on central stations. Experience will be necessary to show exactly what will happen in properties of different classes. Enough data have been gathered, however, to indicate the trend of events in some properties and the probable consequences which must follow the shift in the clocks. In the collection and analysis of these data as much care as possible has been exercised to choose only fairly typical instances and those free from influences other than the advance in standard time. It should also be pointed out that the curves and data herewith were taken only from public utilities in the Middle West, where Eastern time had not been adopted prior to April 1.

SOME INTERESTING DEDUCTIONS

Among the facts apparent and the deductions drawn as the result of the investigation in these properties are:

That the plan as it now is will not effect any great saving in coal.

That a new valley has been created in the average load curve between the hours of 5 p. m. and 8 p. m.

That the average reduction in output in kilowatt-hours due to the daylight saving is around 5 per cent.

That the reduction in gross revenue will be larger proportionately than the reduction in output on account of the fact that the reduction comes mostly out of the "high-rate" business.

That while the change may for the present, in some instances, better the daily load factor, it will no doubt reduce the annual load factor, thus increasing the ratio of investment to income.

That the central stations are accepting the situation in the spirit of patriotism, but with full realization that relief from the general situation of increasing costs and stationary incomes must be granted.

The ten load curves herewith, received from plants in the territory reaching from Ohio to Iowa and from Kentucky to Minnesota, all bring out clearly the creation of the new evening valley. Of course, the amount of electric power and railway load carried by the individual plants determines in a general way how great the depth of this valley is, for it is created by the curtailment of lighting almost entirely.

Moreover, these curves are of interest in the fuel-saving argument. In the first place, the central stations burn only a small percentage of the nation's fuel. They burn it with more than ordinary efficiency. Now, the reduction in load which the daylight bill produces comes at such a time and in such a way that good operation will probably dictate carrying over the new valley many boilers ready to steam. So while a few kilowatt-hours less will be produced, the reduction in coal burned will be very small.

Judging from the general trend of the curves, it is reasonable to expect that the small-town utility will

lose much more than the average large town property. The data on outputs show that in some places the reduction in kilowatt-hours per day was as low as 3.5 per cent, but this could not be accepted at its face value since the daily addition of large power loads to the plants in question must undoubtedly have operated to offset the real decreases. The figure of 5 per cent is selected as the nearest weighted average obtainable. The figures in many cases are higher, especially in non-industrial cities where additional war business is not being added daily.

There appears to be no dissent from the opinion that gross revenue will be reduced by a greater percentage than the output. Those who have the temerity to estimate this place it at around 10 per cent to 15 per cent on the average.

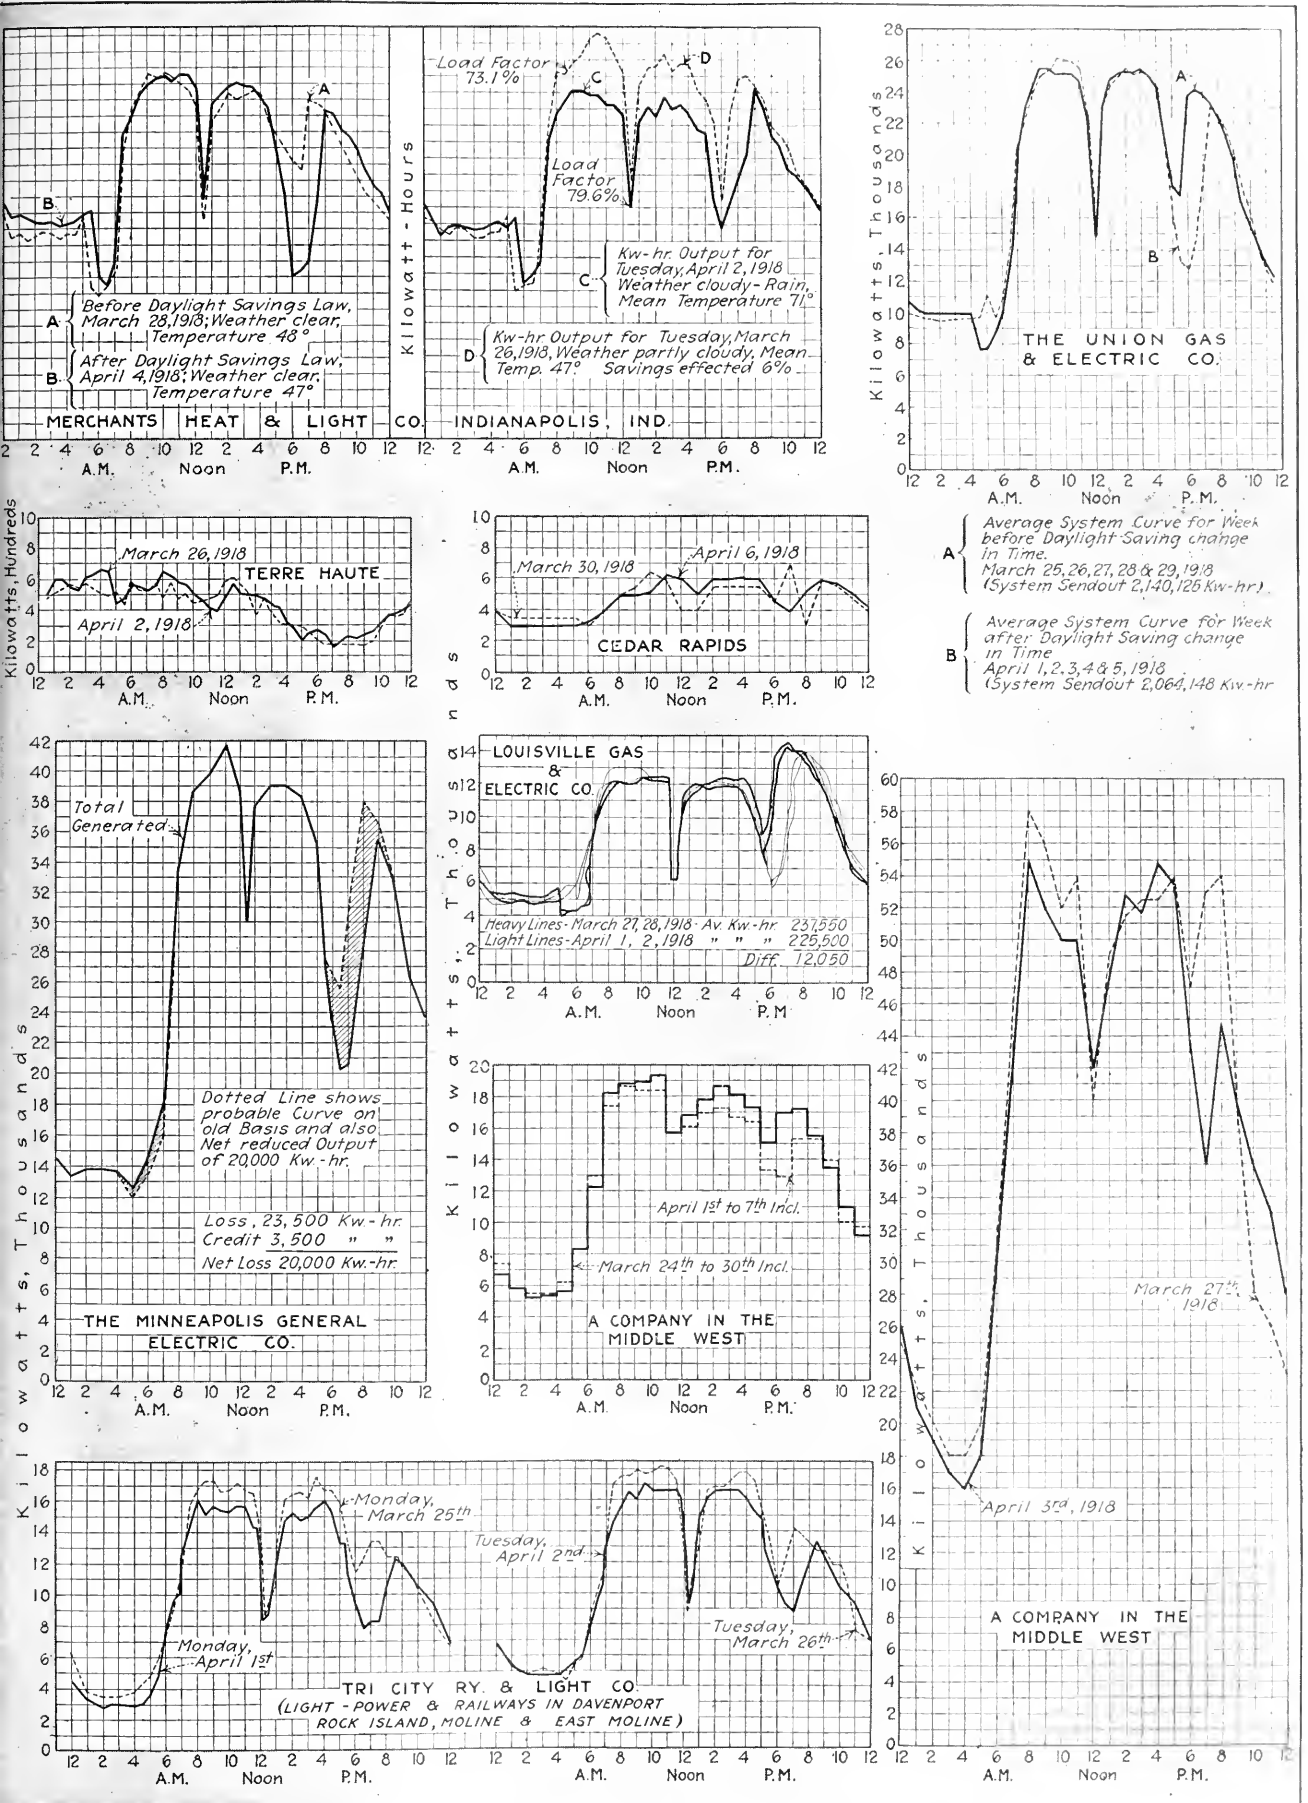

Where it has been possible to secure data on daily load factors, the figures have shown as much as 6 per cent increase for an individual day. Over longer periods the average increase in load factor shown has not been more than 2 per cent or 3 per cent. In fact, it is possible that in some instances worse daily load factors may be obtained under the new time than under the old. This matter of load factors in connection with daylight saving seems to be one of vital interest to central stations, for linked up with it is the question of extending the daylight saving plan to twelve months in the year instead of only seven months as the present law provides. On this subject one Middle Western central-station manager has written:

From the standpoint of conservation of fuel I do not believe that the present plan will accomplish a great deal, but it undoubtedly would if the plan covered the entire year. The plan as decided on will reduce the annual load factor and consequently increase operating and investment cost per unit.

If the plan were carried throughout the year, there would be an increase in the annual load factor, with a consequent reduction in both operating and fixed charges per unit, but more especially there would be a substantial reduction in the output, with a consequent conservation of fuel and reduction in the peak load, owing to the greater diversity obtained. This reduction in the peak load would release a great deal of equipment and enable many central stations to take on additional power business, which is extremely desirable, and would also conserve capital, labor and material by making it unnecessary to add to existing equipment to the same extent that would be necessary under the present plan.

The peaks would undoubtedly come in the morning in most latitudes, if the plan extends throughout the year, but would not be of the magnitude of the evening peak under the present plan.

During the months of November to January inclusive there is an overlapping of the lighting, power and railway loads, due to the fact that the lighting load comes on earlier than during the rest of the year. This makes it necessary for the central stations to provide a large excess of plant capacity to meet this peak load, which is only on about an hour and a half a day during these months. In order to meet this peak load banked fires are carried for twenty-two and one-half hours a day, and this represents an absolute waste of coal. All central-station companies are unquestionably willing to go the limit in carrying out any policies

EFFECT OF DAYLIGHT-SAVING LAW IN MIDDLE WEST CENTRAL STATIONS

which the administration may think necessary to the winning of the war, but, on the other hand, the federal, state and municipal authorities must take cognizance of orders which are increasing the cost to the central station and see to it that not only central stations but public utilities of all kinds receive such increases in rates as will enable them to keep pace with the growth of the communities, and this can only be done if they are permitted to increase rates to a point which will keep them in relatively as favorable a position in respect to earnings as during pre-war years.

The following from another central-station executive is of interest as showing the reality of the need for relief in the way of increased rates. He said:

I think that while this is a real economy and results in a saving of money to the people and a little fuel to the companies, it does not reduce the companies' cost to anything like the extent that it reduces their revenue, as the whole of their organizations must be kept up and the only saving is in fuel. In other words, this will operate as an additional hardship to the electric companies, and it affords one more good reason why the public authorities should take steps to ameliorate the conditions of electric companies brought about by rapidly advancing costs on the one side and stationary revenue on the other.

It must be remembered that while the decrease in kilowatt-hour output is only 5 per cent or 6 per cent, the decrease in revenue is very much larger. The decrease does not come off the power load, but comes almost entirely off the residence lighting load, which with all companies is the highest-priced energy that is sold. A considerable part of the cost of serving residences is what is called "stand-by" costs. These are not diminished at all, nor is the cost of standing ready to answer complaints. In fact, there is no saving except the saving in fuel, and this is very small compared to the loss in revenue.

Should the law not be amended to move the clocks ahead all the year, that new valley will probably be made the target of many a new-business manager. Ways and means of filling it will be the topic of the day. That being the case, it is reasonable to expect intensive solicitation of business that comes on between 5 p. m. and 8 p. m. Electric range loads, electric sign loads, electric truck loads and such business will become increasingly popular with the central station.

That such loads can be secured to fill a part of the valley is one bright gleam on the horizon. What may probably be another is to be found in the experience of a French central station. It was one of the largest concerns generating energy for sale in Paris. Before the daylight plan was adopted it was furnishing some 31,000 kw. per day. Within a day or two after the change this figure fell to 29,000 kw. When the normal daytime distribution of hours was restored in October the same plant was running at a nightly load of 35,000 kw., which within a few days of the change jumped to 53,000 kw.

This might be taken to indicate that the change back to the old standard time, which will take place next October, will be of greater significance to the electric companies than was the change to the new schedule in the spring. Authorities on lighting believe that this can be accounted for by the same theory that accounts for the use of lamps of larger and larger sizes by the general public as lighting has become more efficient. In this development it has been found that it is easy for the public to acquire the habit of using more light but that it is difficult for it to go back to lower standards of illumination when once it has been educated to higher intensities.

A LITTLE PLAIN TALK ON WATER POWERS

[From an address by Senator Jones of Washington in the United States Senate on April 27]

Why does not Congress enact legislation which will make possible the development of our water powers? Why is this not done when we have it on the high authority of the Chief Executive of the land that next to matters relating strictly to the immediate conduct of the war it is the most important public business before Congress?

For ten long years restrictive federal water-power laws have prevented the utilization of the energy contained in our descending waters. This mighty resource has been allowed to waste while enormous quantities of coal and oil have been taken from the earth and used up to meet the ever-increasing demand for electric energy, which during the last decade has increased sixfold.

The development of water powers is pioneer work of a hazardous nature, subject to many risks and uncertainties, and, under regulation of rates by public authorities, the hydroelectric business is and must be conducted upon a close margin of profit. Capital, therefore, will not invest nor men put in their time in hydroelectric development except upon a basis which, so far as government requirements are concerned, will at least not jeopardize the investment or prevent a fair return thereon. The time has come when the country needs the force and energy contained in its wasting water powers to supplement its man power, and the penalty of delay is enforced by fate against the unready.

Let us put the blame where it belongs. The fault is with Congress and with Congress alone. It is the lawmaking body. It cannot escape that responsibility. The controversy in the country over the character of legislation under which water powers can be developed has been reflected in Congress, and thus far we have been unable to get together. Each extreme has held fast to its own view and our water powers have been idle and wasting.

If Congress had acted five years ago and passed suitable legislation, millions and millions of water power would have been utilized that are still going to waste, and the successful carrying on of the war would have been enormously aided, fuel and labor shortage greatly lessened and the transportation problem rendered much less acute.

Failure of Congress to pass a workable water-power law at this session will be nothing short of crime and disloyalty to the dire necessity of our country. Germany and Austria have developed 90 per cent of their water powers and we but 10 per cent of ours.

Senators, the development of our water power would make the United States impregnable in time of war, commercially dominant in time of peace—impregnable in time of war through furnishing the energy required for production of explosives and munitions, for operation of railroads, and in a thousand ways in the conduct of hostilities, thus releasing our man power for the army and navy; commercially dominant in time of peace through furnishing energy for industrial activities, electrical and electrochemical processes, for transportation, for agriculture, and for the innumerable things into which the use of power enters in the daily life of our citizens. The safety, the welfare, the prosperity and the progress of the nation demand and require the prompt enactment of water-power laws in which protection of the public interest shall be co-ordinated with fairness toward capital. The House should pass a bill soon. If amendatory of ours, it should be sent to Congress and our differences harmonized.

Control of Station Auxiliaries

Placing Contactors Near Transformers Saves Copper—Emergency-Supply Circuit Equipped with Instruments to Serve as Test Circuit—Description of Other Methods Used to Good Advantage by Chicago Company

FEATURES of recent additions to the Northwest station of the Commonwealth Edison Company were brought out in last week's issue of the *ELECTRICAL WORLD*, particular attention being called to the excitation system adopted and the relay and protective devices employed. In this article, which concludes the account, it will be pointed out how the auxiliary motors are controlled, how copper has been saved in the circuits feeding them, and how an emergency-supply circuit is provided which may also be used for testing the performance of the auxiliaries.

POWER SUPPLY FOR THE AUXILIARIES AND THEIR CONTROL

Power for the motor-driven auxiliaries used in connection with the first three units installed was supplied at 220 volts, 60 cycles, from two 750-kva., 12,000/230-volt oil-cooled transformers. The circulating pumps were steam-driven. When the last three units were added all circulating pumps were provided with motor drive since the steam units already operating supply sufficient exhaust steam to meet the requirements of the entire station. All of the miscellaneous small auxiliaries of the plant have been added to the original 220-volt system. A 440-volt system has been installed to feed the motors of the circulating pumps and the economizer fans and the external blower fans on units Nos. 5 and 6. The possibility of saving copper dictated this change of potential.

To supply 440-volt power three oil-insulated, water-

equipped with reverse power relays to permit parallel operation and with high and low voltage protection. They feed a 250-volt and a 460-volt bus, the lower potential being used for starting and the higher for running. The power transformers and the switchboards are installed in the transformer house about 300 ft. (91.4-m.) from some of the motors served.

Push-button control is employed for starting all of the motors on the 440-volt system. Industrial-type control was selected because the equipment is operated mostly by a class of labor which can hardly be intrusted with a 440-volt manual-control switching equipment. Moreover, it is less expensive.

The general scheme of control is shown in Fig. 3. The circuit for each 150-hp. economizer motor, of which there are five per unit, is connected with the 250-volt starting bus and 460-volt running bus through two three-pole contactors remote-controlled from push-button stations near the driving motor. Pushing the starting button automatically actuates the three-pole starting and running contactors in turn. Placing the contactors near the transformers, which, as has been said, are quite remote from the motors, has eliminated the necessity for one set of heavy three-conductor No. 4/0 cables per motor which otherwise would have been required for starting service.

An equally interesting plan has been worked out in connection with the emergency service for these motors. As may be seen from the diagram, one 440-volt emergency circuit serves all fifteen economizer motors. Two

FIGS. 1 AND 2—MOTOR-DRIVEN CIRCULATING PUMP AND TURBINE-DRIVEN CONDENSATE AND HYDRAULIC AIR PUMP

cooled, 2000-kva., 12,000/460-250-volt transformers were installed. The 12,000-volt supply for each transformer is taken from the switch house in the same manner as that for the transmission lines.

Polyphase watt-hour meters record the energy consumption on these three lines. The transformers are

sets of contactors are provided at the switchboard, and at each motor station the emergency circuit is connected to the bottom clips of a double-throw selector switch, the normal service to the motor being connected to this upper clip. Auxiliary contacts on this switch automatically transfer the control from the normal to

the emergency circuit when the switch is thrown. The throw-over to emergency is under lock and key, so that only the authorized attendants can have access thereto. The emergency circuit is the only economizer motor circuit in which instrument transformers are connected, it being the idea to use it exclusively if tests are being made.

The cables serving the three 650-hp. circulating pumps on units Nos. 4, 5 and 6 and the two 300-hp.

blowers assure more reliable service than any other source of supply which could be provided. Energy for these solenoids is taken from the station operating bus. The contactors for the various motors of each unit, Nos. 4, 5 and 6, are fed from a separate direct-current bus to localize trouble in emergencies. This grouping of contactors is shown in Fig. 3. Each individual direct-current bus is connected with the station operating bus by means of a single-pole solenoid-operated

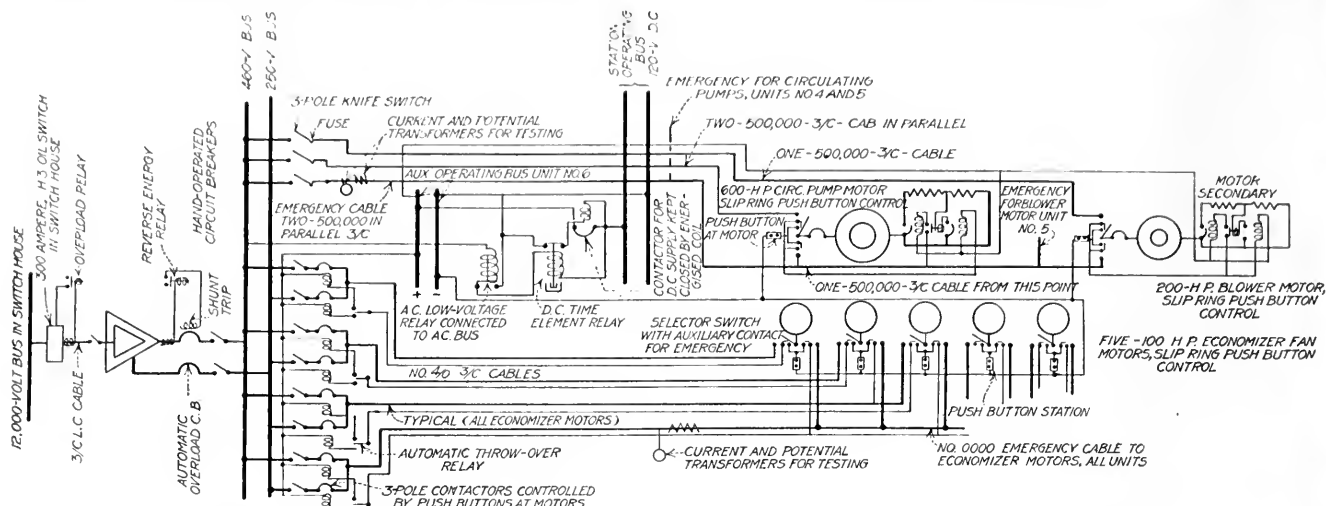

FIG. 3—METHOD OF CONTROLLING AUXILIARIES THAT INCREASES RELIABILITY OF SERVICE

blowers on units Nos. 5 and 6 consist of two three-conductor 500,000-circ. mil lead-covered cable. These are connected to the 460-volt bus through knife switches equipped with fuses. At the starting contactor panel the circuits are connected to double-throw selector switches. The motors, which are of the slip-ring type, are started by push-button control, industrial-type contactors being used to cut resistance out of the rotor circuit instead of employing the 250-volt starting bus. This is done to eliminate heavy rush of current in starting these motors. An emergency feed which is separate from that used for the economizer motors is

switch which is held closed by a two-element low-voltage relay. This consists of an alternating-current instantaneous relay of the circuit-closing type which closes the circuit through a direct-current time-element relay of the circuit-opening type. The two-element relay operates if the potential on the 460-volt bus drops as low as 230 volts for ten seconds.

Additional protection for the auxiliary equipment is provided by the installation of signal lamps near the push-buttons controlling all of the 440-volt motors. The lamps are fed from the 250-volt bus. The buttons are not to be operated unless the lamps are lighted, in-

FIGS. 4 AND 5—COMBINED AIR AND CONDENSATE PUMPS SERVING 35,000-KW. TURBO-GENERATOR AT RIGHT

provided for the motors. It is connected to the selector switches at the contactor panels and is equipped with instrument transformers for testing purposes.

All of the contactors on the 440-volt system are operated by 120-volt direct-current solenoids. Direct current was selected because the storage batteries em-

dicating that the starting bus is energized. This precaution has been taken to prevent the starting of motors on full potential.

The entire electrical design of the Northwest station was handled by the inside plant division of the engineering department of the company.

Value of Higher Steam Pressures

A Statement of the Yearly Saving Which Can Be Realized from Higher Steam Pressures, with Capitalized Value of This Saving for Various Loads, Coal Rates and Rates of Capitalization

BY J. T. FOSTER

Engineer Public Service Electric Company of New Jersey

DECREASED net profits due to the rapidly mounting cost of operation have forced the central-station industry to face a serious situation. While it is true that a measure of relief has been obtained by the granting of petitions for increased rates, the greater part of the difference between normal profits and present-day profits has to be made up by rigid economy. This condition is not limited by the duration of the war because there is always a greater or less degree of inflation which causes the high prices of material and labor to continue for some years after the actual conflict has ceased.

The need for practicing economy, however, is not a new experience for utility companies, as the whole development of the industry has been along the lines of more economical operation. Since the steam turbine first came into use the attention of operating and designing engineers has been directed to its improvement because the greatest heat loss by far occurs in this part of the power-plant equipment. Condensing apparatus was improved and superheat increased so as to operate on the most efficient part of the steam cycle, and in addition the mechanical features of the turbine were redesigned to make the actual machine show a

performance as close as possible to that of the ideal turbine.

It is probable that because of mechanical limitations the ratings of turbines will not increase much above those of the largest units now in use and that any further progress will necessarily involve increasing the steam pressure.

The installation at the Joliet plant of the Public Service Company of Northern Illinois of a 10,000-kw. turbine designed for 300-lb. (21 kg. per sq. cm.) steam pressure is an advance in this direction, and it is believed that water-rate tests on this unit will show a surprisingly low steam consumption for a turbine of this capacity.

It is probable that within the next five years operating pressures will be increased to 500 lb. or 600 lb. (226.8 kg. to 272.2 kg.), so it is interesting to calculate just what will be the probable effect on fuel cost under these conditions. Fig. 1, which is a curve* of theoretical Rankine-cycle water rates and thermal efficiencies, may be used to ascertain the money value of any change to higher pressures. Fig. 2 indicates the yearly saving and the capitalized value of this saving for various load factors, coal costs and rates of capitalization. The method of calculating the points is illustrated by Table I, printed on the following page.

The use of the chart for obtaining this information is illustrated by the following problem:

FIGS. 1 AND 2—THERMAL EFFICIENCIES AND WATER RATES OF TURBINES WITH DIFFERENT STEAM PRESSURES, AND METHOD OF ASCERTAINING CAPITALIZED VALUE OF SAVING POSSIBLE WITH HIGHER STEAM PRESSURES

performance as close as possible to that of the ideal turbine.

Probably the most profitable line of development was that of increasing the capacity of turbo-generators, as this resulted in a marked improvement in thermal efficiency and a consequent decrease in steam consumption. Recent developments, however, have led some en-

Problem.—What would be the yearly saving and value of the saving, capitalized at 17 per cent, resulting from an increase in pressure from 200 lb. (14 kg.) to 500 lb. (35 kg.), keeping the steam temperature constant at 600 deg. Fahr. and the vacuum at 28 in. (70

*Reproduced from an article by the author in the ELECTRICAL WORLD of Dec. 8, 1917.

em.). Boiler and furnace efficiency is assumed to be 70 per cent, load factor 60 per cent and cost of 14,000 B.t.u. coal \$5 per 2240 lb. (1016 kg.).

Solution.—On the 500-lb. line in the upper left-hand quadrant of the chart project upward to 28-in. vacuum line, then horizontally to the 60 per cent load-factor

TABLE I—RELATIVE COAL COSTS AT 200 LB. AND 500 LB. STEAM PRESSURE
Steam Temperature, 600 Deg. Fahr. Vacuum, 28 In.

	200 lb.	500 lb.
Rankine thermal efficiency (per cent)	30.9	35.0
Rankine efficiency ratio (per cent)	76.7	74.0
Combined boiler efficiency (per cent)	70.0	70.0
Load factor (per cent)	60.0	60.0
Coal cost, 2240 lb., 14,000 b.t.u.	\$5.00	\$5.00
B.t.u. equivalent of one kw.-hr	3415	3415
Unit of capacity (kw.)	1000	1000

Cost per day (200 lb. pressure):
$$\frac{3415 \times 1000 \times 24 \times 0.60 \times 5}{0.70 \times 0.309 \times 0.767 \times 2240 \times 14,000} = \$17.20$$

Cost per day (500 lb. pressure):
$$\frac{3415 \times 1000 \times 24 \times 0.60 \times 5}{0.70 \times 0.35 \times 0.740 \times 2240 \times 14,000} = \$43.35$$

Daily saving = \$47.20 - \$43.35 = \$3.85.
Yearly saving = \$3.85 × 365 = \$1,405.
Capitalized value of \$1,405 at 17 per cent = \$8,265.

line, vertically downward to the \$5 coal line, then horizontally again to the left, where the annual saving (\$1,400) will be found. Continue vertically to the left to the 17 per cent capitalization line, then vertically downward, and read the capitalized value as \$8,250.

This means that \$8.25 per kilowatt is the maximum increase in cost which could be paid for the benefits of 500 lb. pressure under the conditions. It is interesting in this connection to refer to Table I, which shows an estimate of the increase in cost of equipment to take care of higher pressures.

It may be noted that for 500 lb. pressure the estimated increase in total cost of the plant is 4.40 per cent. Referred to a cost of \$80 per kilowatt of plant capacity at 200 lb., the cost of a 500 lb. plant would be approximately \$83.50, or \$3.50 more per kilowatt. This partly offsets the \$8.25 per kilowatt obtained from Fig. 2.

TABLE II—PER CENT* INCREASE IN TOTAL COST OF PLANT WITH ADOPTION OF DIFFERENT PRESSURES

Item	PRESSURE (LB.)			
	300	400	500	600
Boilers	0.75	1.50	2.20	2.90
Turbines	1.40	1.40	1.40	1.40
Condensers	-0.20	-0.40	-0.50	-0.60
Economizers	0.00	0.00	0.00	0.00
Piping	0.50	0.90	1.30	1.70
Total percentage increase	2.45	3.40	4.40	5.40

*Referred to 200 lb. as a datum.
but still leaves \$4.75 as the net gain. The yearly saving corresponding to this capitalized figure is \$810 per thousand kilowatts of capacity. While there may be some factors which will decrease this amount somewhat, it is believed that the change will be profitable and that a large part of the estimated gains will be realized.

An Ornamental Corona Discharge

The illustration shows an interesting example of the use of a corona discharge for a practical purpose. The A. I. E. E. emblem was formed of copper wire, No. 18 B. & S., embedded in a mica shield and energized with

PUTTING A PHENOMENON TO PRACTICAL USE

30,000 volts at a frequency of 200,000 cycles per second. This is probably the first time that a corona phenomenon has been turned to practical advertising use. The demonstration took place very recently at a meeting of the Toronto Section of the A. I. E. E. On this occasion a paper was read by W. P. Dobson on the subject of "High-Voltage Phenomena."

Electrification at St. Louis

The Anheuser-Busch Brewing Association, St. Louis, Mo., is building a seven-story structure covering an entire city block. In the design of this "Bevo Building" arrangements were made for thirteen railroad tracks about ten cars long, extending into the basement of the building and between umbrella sheds for the purpose of loading cars. It was realized that it would be unsatisfactory to have steam locomotives do the switching under this building. This necessitated the adoption of electric locomotives for that portion of the line.

The Manufacturers' Railway, which consists primarily of switching yards in St. Louis with interchange connections with the other railroads, in following its policy of general improvement has now decided to extend the electrification from the Bevo Building switching yard so that electric locomotives can be used in interchanging cars with other lines.

The substation for this electrification is at about the center of the electrified zone. Energy will be purchased from the Union Electric Light & Power Company at 13,200 volts alternating current and will be distributed at 600 volts direct current. The transformation will be performed by one 1050-kva., three-phase, 13,200-volt transformer and one 1000-kw. rotary converter, started from half-voltage taps. Provision was made for installing an extra converter at some future time when the steam locomotives are not helping with the switching, as they are at present.

Precise Measurement of Alternating Currents

Elements of Two Identical Electrodynamometers so Connected in Wheatstone Bridge that Alternating Current Through Elements Can Be Ascertained by Measuring Direct Current That Produces Zero Torque

BY C. O. GIBBON

A PRECISION method of measuring alternating currents which involves relatively simple apparatus and in which disturbing influences of all kinds are eliminated or minimized so that their effects are negligible has been investigated by the writer to determine the accuracy of the method. In brief, the apparatus required consists of two identical electro-dynamometers, the fixed and movable coils of which are inserted in the arms of a Wheatstone bridge so that if an alternating current is allowed to flow through the coils its value can be ascertained by measuring the direct current required in the same coils to produce zero torque.* In other words, conditions are adjusted so that there is no deflection of the electro-dynamometer and the value of the alternating current is determined by measuring the direct current with a potentiometer.

Theory Involved.—The principles which are involved can be explained by considering the bridge circuit $fbgd$ (Fig. 1). Let A and a represent respectively the fixed and suspended coils of one electro-dynamometer, and C and c the coils of an exactly similar instrument. Denoting the resistance by R , the self-inductance by L and the mutual inductance by M , with the proper subscripts to designate the various arms of the quadrilateral or bridge circuit, let it be assumed that the following electrical conditions are satisfied:

$$\begin{aligned} R_A &= R_C = R_a = R_c && \text{ohms (1)} \\ L_A &= L_C, L_a = L_c && \text{henries (2)} \\ M_{Aa} &= M_{Cc} && \text{henries (3)} \end{aligned}$$

R_A includes, of course, the whole resistance in the arm fb , and similarly with the other elements.

If across the terminals b and d of such a circuit a continuous emf. be impressed by inserting a storage battery controlled by the switch S_c , a continuous current of I_c will flow through the external circuit $bS_c d$. Owing to the conditions assumed, this current will divide equally between the two sides of the bridge, $I_c/2$ amp. flowing through the side bgd , and $I_c/2$ amp. flowing through the side bfd . Since the resistances of the arms are equal, the potential difference from f to g caused by the continuous current is zero. Hence f and g may be connected together with a wire, or any conditions desired may be imposed upon the external circuit $fS_a g$, without either disturbing the continuous currents through the various arms of the bridge or affecting the external circuit $bS_c d$. Conversely, any variation in the external circuit $bS_c d$ will in no way either affect the external circuit $fS_a g$ or disturb the

distribution of continuous currents through the various arms of the bridge circuit.

Likewise, if an alternating emf. be impressed across the terminals f and g of the bridge circuit by closing the switch S_a , an alternating current of I_a r.m.s. amp. will flow through the external circuit $fS_a g$. Owing to the conditions assumed at the outset, this current will divide equally between the two sides of the bridge, $I_a/2$ amp. flowing through the side fbg , and $I_a/2$ amp. flowing through the side fdg . The potential difference from b to d caused by this alternating current will be zero. Hence b and d may be connected together by means of a wire, or any desirable conditions imposed upon the external circuit $bS_c d$, without either disturbing the alternating current through the various arms of the bridge circuit or affecting the external circuit $fS_a g$. Conversely, any variation in the external circuit

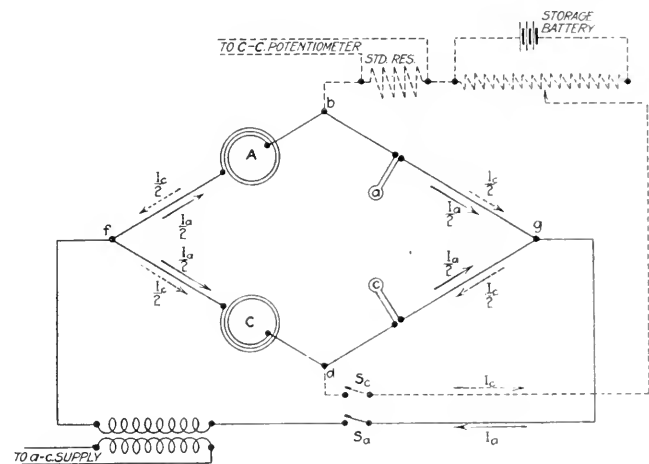

FIG. 1—D.C.-A.C. BRIDGE IN SIMPLIFIED FORM

$fS_a g$ will in no way either affect the external circuit $bS_c d$ or disturb the distribution of alternating currents through the various arms of the bridge circuit.

From the above considerations it is evident that a continuous emf. may be impressed across bd simultaneously with an alternating emf. across fg without the resulting currents interfering with each other beyond the terminals of the bridge circuit. Within the bridge circuit, however, the alternating and direct currents will be superposed through the coils of each of the electro-dynamometers A, a and C, c .

Resultant Torque.—Considering instrument Aa only, let i equal the instantaneous value of the complex harmonic current, of r.m.s. value I_a , which flows through the instrument. Then

$$i = \sqrt{2}[I_1 \sin \omega t + I_2 \sin (2\omega t + \beta_2) + I_3 \sin (3\omega t + \beta_3) + \dots] \quad \text{instantaneous amp. (4)}$$

and, as can be easily demonstrated,

$$I_a^2 = I_1^2 + I_2^2 + I_3^2 + \dots \quad \text{r.m.s. amp. (5)}$$

The even harmonics are usually negligible.

During one-half of the cycle the current through the

*The employment of an electro-dynamometer in a null or zero-reading method for precise measurements of alternating currents was originally suggested by Drs. P. A. Wenner and E. Weibel at the Bureau of Standards. It was communicated by them to Dr. A. E. Kennelly at Harvard University, under whose direction the writer made this investigation on the use of the method. Since the conclusion of the research information has been received from the Bureau of Standards that the method has been tested there with very satisfactory results. Inasmuch as the method was first developed at the bureau, the writer is indebted to that body for permission to announce his results, and he is also under obligation to C. W. Whitall for assistance in making the tests at the Massachusetts Institute of Technology.

fixed coil A (Fig. 1) is $(I_c/2 - i/2)$ amp., and that through the suspended coil a is $(I_c/2 + i/2)$ amp., taking the positive directions of the continuous currents as designated by the dotted arrows. During the other half of the cycle the fixed coil receives $(I_c/2 + i/2)$ amp., and the suspended coil $(I_c/2 - i/2)$ amp.

The instantaneous torque developed by an electro-dynamometer, being proportional to the product of the

FIG. 2—FORM AND ESSENTIAL DIMENSIONS OF ONE OF THE ELECTRODYNAMOMETERS AFTER REMODELING

All coils are of enameled copper wire. The two fixed coils A_1 and A_2 have a combined resistance of about 116 ohms at 25 deg. C. and a combined inductance of nearly 0.15 henry. Each is composed of 1390 turns of No. 30 A. W. G. wire of bare diameter 0.255 mm., enameled to about 0.274 mm. The movable coil contains 676 turns of No. 38 A. W. G. of bare diameter 0.101 mm., enameled to about 0.112 mm. It has a resistance of about 115 ohms at 25 deg. C. and an inductance of 14.5 millihenries.

instantaneous currents in fixed and movable elements, is at any moment

$$T' = (k/4) (I_c + i) (I_c - i) \quad \text{dyne perp. cm. (6)}$$

where k is a constant depending upon the construction and adjustment of the instrument and is so chosen that T' will be the torque, in dynes perpendicular to a radius of 1 cm., set up by a current of 1 amp. passing steadily through both elements. Then

$$T' = (k/4) (I_c^2 - i^2) \quad \text{dyne perp. cm. (7)}$$

The average resultant torque T during one complete cycle of the fundamental frequency is

$$T = \frac{k}{4} \times \frac{1}{2\pi} \int_{\omega t = 0}^{\omega t = 2\pi} (I_c^2 - i^2) d(\omega t) =$$

$$\frac{k}{4} \times \frac{1}{2\pi} \left[\int_{\omega t = 0}^{\omega t = 2\pi} I_c^2 d(\omega t) - \int_{\omega t = 0}^{\omega t = 2\pi} i^2 d(\omega t) \right] \text{ dyne perp. cm. (8)}$$

$$= \frac{k}{4} I_c^2 - \frac{k}{4} \times$$

$$\frac{1}{2\pi} \int_{\omega t = 0}^{\omega t = 2\pi} 2[I_1 \sin \omega t + I_2 \sin (2\omega t + \beta_2) + \dots]^2 d(\omega t) \text{ dyne perp. cm. (9)}$$

$$= \frac{k}{4} [I_c^2 - (I_1^2 + I_2^2 + \dots)] = \frac{k}{4} (I_c^2 - I_a^2) =$$

$$k \left[\left(\frac{I_c}{2} \right)^2 - \left(\frac{I_a}{2} \right)^2 \right] \text{ dyne perp. cm. (10)}$$

The first integral in equation (8) is the steady torque which would be produced by a continuous current $I_c/2$ in both elements acting alone. The second integral is the average resultant torque which would be produced by the alternating current passing through both coils and acting alone.

The resultant torque T must therefore vanish when the alternating current is of such strength that its torque just equals the torque produced by the continuous current. According to equation (10) this will occur when the root-mean-square value of the alternating current I_a in the external circuit $fSag$ is numerically equal to the steady value of the continuous current I_c in the external circuit bSd . Exactly the same conclusions may be reached by a consideration of the instrument C,c (Fig. 1).

Therefore an alternating emf. may be impressed across gf , the current I_c regulated with a suitable rheostat till the deflection of A,a is zero, and I_c then determined to any desired degree of precision by measuring, with a direct-current potentiometer, the drop in potential across the standard resistance in Fig. 1. The r.m.s. value of I_a will then be numerically equal to the measured value of I_c .

Simplification Possible.—Since only the instrument A,a needs to be observed, the instrument C,c , which serves merely as a pair of impedances to balance the impedances of A,a , need not be constructed in the form of a dynamometer. However, to facilitate satisfying the conditions previously mentioned it is advisable to use a duplicate dynamometer instrument in which the movable coil, instead of being suspended, may be so adjusted as to occupy any desired position relative to the fixed coil. If, so far as their electric and magnetic circuits are concerned, the two instruments are thus exact duplicates, equations (1) and (2) will be satisfied; while if the position of c relative to C is adjusted to exactly that of a relative to A , equation (3) will be satisfied. By arranging the working instrument so that the zero position of a is perpendicular to A , and adjusting the coils of the "dummy" electro-dynamometer so that they are mutually perpendicular, then there is no appreciable stray magnetic flux from one instrument to the other if the two are sufficiently separated. Thus mutual inductance is eliminated from consideration and

$$M_{Ac} = M_{Aa} = M_{Ca} = M_{Cc} = 0 \quad \text{henries (11)}$$

The Experimental Instrument.—In order to secure the necessary equalities among the constants of the bridge circuit and to avoid any possible trouble from eddy currents in the frames of the instruments, a pair of wooden-box laboratory galvanometers were used for conversion into electro-dynamometers, one as the working instrument and the other as the "dummy." The

FIG. 3—DETAILED DIMENSIONS OF COILS USED IN ELECTRODYNAMOMETER

two instruments were identical except that the movable coil of the dummy instrument was mounted in a wooden spindle so that it could be set at any desired angle with respect to the fixed coils.

Although theoretically possible, it is not practically feasible to construct two exactly similar instruments which will conform with adequate precision to equations (1) and (2). To obtain the exact balance of the

quadrilateral or bridge circuit required for precise measurements, it was necessary to add small adjustable resistances and inductances in the various arms external to the instruments themselves (Fig. 4).

To render the working instrument independent of the earth's magnetic field, a compensating bar magnet was so placed that when the movable coil is energized alone with continuous current, by having key m and a plug at h open and closing key w , no deflection occurs. The deflection of the movable coil was observed in the

*The percentage errors are based upon the direct-current readings; + indicates that the direct-current reading is greater than the alternating-current; - indicates that the alternating-current reading is greater than the direct-current.

usual manner by means of a mirror and beam of light reflected from a scale into a telescope. The motion of the movable coil is damped by means of a mica vane submerged in oil.

Method of Balancing and Results Obtained.—The continuous current used for balancing the alternating current was obtained from a storage battery, while the alternating currents to be measured were supplied through the choke coils Z and t from the secondary coil of a transformer excited by a 60-cycle sine-wave alternator. As indicated in Fig. 4, both the alternating and direct currents, after being balanced on the differential electro-dynamometer, were measured in succession by one and the same Drysdale-Tinsley a.-c.-d.-c. potentiometer. The dynamometer was balanced by adjusting the slide wire of resistance r until no deflection was observed on opening or closing m . The alternating-current and direct-current drops of potential across the standard 10-ohm non-inductive resistances R and R' were then measured by the potentiometer.

A sinusoidal current is essential to this check, because the tuned vibration galvanometer used with the alternating-current potentiometer responds selectively to the fundamental frequency and will indicate a balance only for I_1 in equation (5). Furthermore, as has already been demonstrated by the algebraic analysis, the differential electro-dynamometer balances for the root-mean-square I_a —see again equation (5)—of any ordinary alternating wave form, unless such relatively high-frequency harmonics should be present that capacitance effects are produced between the layers in the windings. In this case an error might be produced in the effect of that particular component. The effect of such errors of small high-frequency components upon the resultant root-mean-square value, however, may be regarded as insignificant.

From the table it may be seen that the average difference between the alternating current and direct current above 10 milliamp. is 0.125 per cent, or 1.25 per mil. By studying the behavior of the instrument with a view to improvement it is believed that a still higher degree of precision could be obtained over a considerably wider range.

Important Where Alternating Current Is Applied.—There is a slight advantage in impressing alternating emf. across bd and a continuous emf. across fg because the zero position of the movable coil need not then be perpendicular to the fixed coil, a feature of considerable advantage from the practical viewpoint. This is true because if the moving coil of the working instrument should deflect so as to increase the inductance of both elements, more alternating current will tend to flow through C, c than through A, a , with an alternating emf. impressed across fg , thus causing false balances in the differential electro-dynamometer. On the other hand, if an alternating emf. be impressed across bd , the increase in inductance between A and a will in no wise disturb the distribution of the alternating currents through the various arms of the Wheatstone bridge.

As a practical laboratory instrument, the differential electro-dynamometer should be self-contained. The dummy might advantageously be mounted in the pedestal of the working instrument, with its fixed and movable coils mounted rigidly perpendicular to each other. The fixed and movable elements of each might be designed so as to have very nearly equal resistances and inductances, and so small over-all adjustments of each could be made for the final precision balance. A single set of alternating-current and direct-current adjustments could then be made to equalize the four arms of

FIG. 4—COMPLETE TEST CIRCUIT EMPLOYED

The alternating-current external circuit is indicated in heavy lines and the direct-current external circuit in broken, light lines. These two external circuits are carefully insulated from each other. A double key m permits both circuits to be closed or opened simultaneously. The quadrilateral is adjusted into resistance balance, to satisfy equation (1) by means of the three adjustable resistances e , g and k . Being non-inductive, these resistances can be adjusted without changing the inductance of the arms. The Campbell variable mutual inductance V and the variometer f make it possible to obtain the inductance balance without disturbing the resistance balance, since the inductance balance can be adjusted thereby to satisfy equation (2) without changing the resistance in the arms. Each arm is balanced against the corresponding arm with both continuous and alternating currents. Mutual inductance between the fixed and movable coils is eliminated, as indicated in the paragraph immediately preceding equation (11).

the quadrilateral. Such an instrument, once adjusted, should prove a very convenient, inexpensive and extremely accurate device for making precise measurements of alternating currents.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

CHARTING INSTRUCTIONS TO GET BETTER ECONOMIES

How an Iowa Company Instructs Its Plant Operators to Handle Different Loads and Secures a Record of the Way Plant Is Actually Run

Realizing that the over-all efficiency of its station will reach its maximum if the various generating units are combined to run at the most economical loads for the particular load condition encountered, the Moline-Rock Island Manufacturing Company, Davenport, Iowa, has worked out a scheme for showing its plant operators how to combine the generators to get the best results. Tests were run on the units to determine their efficiencies in terms of steam consumption at various loads within their ratings. While the results of these tests (Fig. 1) can be used by any one having technical skill and judgment to determine the proper combination of machines to carry any load, the company desired to present the information in such form that any operator, regardless of his technical judgment, may determine instantly what to do under ordinary conditions. Consequently all of the more common operating conditions that are likely to arise are listed

CHART OF TURBINES TO OPERATE AT DIFFERENT LOADS TO RELIEVE OPERATOR FROM NECESSITY OF RELYING ON HIS OWN JUDGMENT

Kw. Load	Units in Service	Kw. Load per Respective Unit
Up to 1750	3,000	Total load
1,750-4,500	6,000	Total load
4,500-8,000	10,000*	Total load
10,000	10,000 6,000	8,000-9,000 2,000-1,000
12,000	10,000 6,000	9,000-8,000 3,000-4,000
14,000	10,000 6,000	10,000-9,000 4,000-5,000
16,000	10,000 6,000 3,000	10,500-11,000 5,300-4,800 200

STEAM CONSUMPTIONS OF DIFFERENT UNITS AND PORTION OF LOG SHEET USED BY DAVENPORT (IOWA) COMPANY

Curves Nos. 1 and 5 represent the water rates and total steam consumption of a 3000-kw. turbine at 100 per cent power factor and 0 deg. superheat; Nos. 2 and 6 represent the corresponding quantities for a 6000-kw. turbine at 90 per cent power factor and

100 deg. superheat; Nos. 3 and 7, the values for a 10,000-kw. turbine at 95 per cent power factor and 100 deg. superheat, and Nos. 4 and 8, the values for a 20,000-kva. turbine at 80 per cent power factor and 125 deg. superheat.

in a table like that shown herewith, giving the combinations of units to use and the loads on which each unit shall be operated. With this table the operator needs to do no figuring and does not even have to consult the curve sheet.

As a detail in connection with the actual making of these charts and curves, it is interesting to observe that the tabulated data are blue-printed on separate sheets and then pasted on the curve sheet. This saves time in changing the tracings as well as the curve

sheets when changes in the operating schedule are necessary.

Of next importance to providing proper instructions for handling various loads is the matter of seeing that the instructions are carried out intelligently. The officers of the company keep in touch with this situation through a system of daily power-house reports. In addition to the usual data asked for on daily power-house reports, these reports call for the load curves from each of the plants, the total load curve and a

graphical statement of the hours of operation of each turbine and boiler unit. A part of one of these reports is reproduced herewith. The horizontal lines drawn through the load curves are the feature of the report. Each line, it may be observed, is opposite the designation of a turbine or boiler unit at the right margin of the page. The length and position of these lines indicate what machines were used at each hour, and also show in definite relation to the load curve how accurately instructions have been carried out. The lines used to show boiler operation also show whether the boiler was steaming or was banked.

B. J. Denman, president of the Moline-Rock Island Manufacturing Company, is a strong believer in the value of this method of charting operating methods. He has applied it in the past to other plants under his direction, and each time improved economy has resulted.

USE OF SIMPLE PANEL FOR THE TESTING OF FUSES

**Permanently Connected Lamps and Fuse Blocks
Permit Testing Plug or Cartridge Fuses
in Short Space of Time**

A panel is in use at the New Haven (Conn.) office of the United Illuminating Company which makes it very convenient to test fuses. As shown herewith, it consists of two 10-watt lamps and two fuse blocks mounted at the top of a 10-in. (25.4-cm.) by 14-in. (35.5-cm.) by $\frac{1}{2}$ -in. (1.27-cm.) wooden board equipped with a $\frac{1}{8}$ -in. (0.32-cm.) wire brace permitting the device to be set upon the counter easel fashion. The fuse blocks are wired in multiple as indicated so that either a plug fuse or a cartridge-type fuse up to those rated at 30 amp. may be tested at a moment's notice. The

OUTFIT TO TEST CONTINUITY OF PLUG OR CARTRIDGE FUSES

test is for continuity only, the lighting of the lamp above the tested fuse indicating a satisfactory circuit through the fuse under examination. One plug fuse and one cartridge fuse remain in circuit constantly. The thread in the receptacle at the left, where the plug type of fuse is tested, has been hammered down so that no screwing in of the plug is required in testing.

AN INEXPENSIVE MOUNTING FOR TRANSFORMER BUSES

**Steel Strap Attached to Case Supports Pin Insulator,
Which in Turn Carries Bus—Method Is Both
Safe and Neat**

When installing small three-phase delta-connected transformer blanks the difficulty of placing the connection between the two end transformers may often be solved, as shown in the accompanying figure, by mount-

BUS CONNECTING TERMINALS AT OPPOSITE ENDS OF BANK
SUPPORTED BY PIN INSULATOR ATTACHED TO
TRANSFORMER CASE

ing a pin-type insulator directly on the case of the middle transformer. The pin is bolted to a piece of galvanized strap steel, which may in turn be fastened either to one of the cover bolts or one of the bushing bolts of the transformer. The resulting installation is safe, neat and inexpensive and is preferable to buses supported by strain insulators attached to the side walls of the substation or to poles. Where the bushings are of the inverted type it is usually necessary to attach a pin-type insulator to the case of each end transformer.

STAR-CONNECTED DISTRIBUTION VERSUS DELTA-CONNECTED PLAN

**Relative Advantages of These Two Systems of Oper-
ation as Determined from Experience in
Changing System at Madison, Wis.**

Summarizing his experience in changing the Madison Gas & Electric Company's distribution system from 2300-volt delta delta-connected to 2300/4000-volt star-delta-connected circuits, George Wagner, superintendent of distribution, said before the recent Wisconsin Electrical Association:

On account of the increased voltage in the three-phase, four-wire system, the amount of copper required for transmitting the same load over the same distance is very much less than is necessary with the other systems. The change to the four-wire system does not cause a change in voltage on the step-down transformers; therefore the transformers need not be changed. On account of the "Y" connection and the simplicity of regulation attending its use the four-wire system can be used for supplying energy for light, heat and

power purposes from one circuit, thereby overcoming the necessity of parallel circuits. This produces an additional saving in copper.

In order to protect all parts of the circuit against excessive voltage to ground, and to protect the single-phase lighting transformers against excessive voltage, the neutral wire of a three-phase, four-wire circuit should be grounded not only at the station but at a sufficient number of points along the line. Furthermore, the neutral of three-phase transformer banks should be isolated. When the neutral point of a three-phase transformer bank is connected with the neutral wire of the circuit the delta-connected secondaries tend to equalize the phase voltages. Therefore, this should not be done except with transformers of large capacity. If a single-phase load is supplied from one phase of the delta-connected secondaries of a three-phase bank of transformers, the transformer on that phase will supply only one-half of the single-phase current, and the other two transformers will supply the remainder whether the primary neutral point is connected to the neutral wire or not.

PRECAUTIONS TO OBSERVE IN THE STORING OF COAL

Ample Ventilation or Total Exclusion of Air Should Be Afforded—Suggestions for Preventing the Starting of Fires

Heat due to oxidation rather than pressure was given as the main cause of spontaneous combustion of bituminous coal by Prof. H. H. Stoeck of the University of Illinois before a recent meeting of the Western Society of Engineers at Chicago. He said that coal should be stored so as entirely to exclude any air, or else adequate ventilation should be provided to keep the coal at a low temperature. Any intermediate conditions are dangerous and should be avoided.

Among precautions which were suggested for preventing spontaneous combustion were: Coals of different varieties should not be mixed while in storage, and the coal should not be piled high on account of the difficulty of moving it in case of fire. If sufficient heating occurs to raise the temperature to 150 deg. Fahr., close watch should be kept on the pile; if the temperature increases to 175 deg. Fahr., it should be moved and cooled before more coal is added. Equipment for storing coal should be arranged to make it possible to move the coal quickly in case of an emergency. To avoid the starting of fires pieces of wood and greasy waste should be carefully removed from storage piles and the coal in storage should be kept away from external sources of heat, such as steam pipes.

PROTECTION OF APPARATUS FROM LIGHTNING STORMS

Types of Arresters to Use With Different-Size Transformers—Necessity of Limiting Discharge Current Through Electrolytic Arresters

"Protection of Electric Apparatus Against Lightning" was the subject of an address given recently before the transmission and distribution men of Ohio by V. E. Goodwin, lightning arrester engineer of the General Electric Company. He recommended that transformers of 15-kw. rating and less should be protected with the compression-type arrester. Transformers of 150-kw. rating and less should be protected with the graded shunt multi-gap arrester. All transformers above 150-kw. rating should be protected with the elec-

trolytic lightning arrester. Lightning arresters should be installed to protect particular apparatus and therefore should be placed as near the apparatus as possible. The cost of high-tension apparatus, such as transformer lightning arresters, etc., increases as the cube of the voltage ratio increase.

Considering the care of electrolytic arresters, Mr. Goodwin pointed out that this type of arrester is designed for approximately one-half hour's continuous discharge. This is a rather severe condition, however, and should not occur very often. When an electrolytic-type arrester discharges an increase in temperature takes place which will dissolve the film and thereby eliminate the resistance offered to the flow of electricity. This discharge would cause a short circuit if permitted to continue. Fuses in series with the horn-gaps would limit the discharging current and thereby protect them from difficulties of this kind. The ground connection was considered the most vital part of any of the lightning arresters; therefore great care must be used in choosing such grounds and only selecting locations which will assure a normally stable ground.

ARRANGEMENT THAT SERVES PURPOSE OF DOUBLE BUS

Advantages to Be Gained by Using Double Busbars Did Not Justify Increased Cost of Construction—Switches Serve Purpose

In building the Antioch substation of the Great Western Power Company it was decided that the cost of a double busbar system was not warranted solely by the flexibility it would afford. As an alternative plan a

SINGLE-BUS SYSTEM IN SUBSTATION THAT ANSWERS THE PURPOSE OF DOUBLE-BUS ARRANGEMENT

single-bus system was installed embodying an arrangement of cut-out switches that would permit obtaining about the same results as when a double-bus system was used.

The accompanying diagram shows the principle utilized, which provides for the isolation of practically every piece of apparatus in the station without interrupting the service. It is estimated that a saving of about \$8,000 resulted from the use of the arrangement which is here described.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

CHANGING A POWER CONTRACT TO OBTAIN GREATER PROFIT

Massachusetts Company Instead of Charging Railway for Direct-Current Energy Now Charges for Alternating Current, Including Losses

Power for the operation of the Northern Massachusetts Street Railway, serving the Athol-Gardner district of the State, has been furnished by the Athol Gas & Electric Company since 1912. At that time a contract was entered into by which the central station agreed to furnish power measured as direct current at the rate of 1.8 cents per kilowatt-hour and to assume all converting and machine losses. Under the terms of the contract it was necessary for the railway company to build and maintain a three-phase high-tension transmission line from Westminster to the Athol fair grounds, costing about \$36,000. On the basis of an annual consumption of 3,000,000 kw.-hr., the interest charge on this investment amounted to \$1,800 (at 5 per cent) or 0.06 cent per kilowatt-hour, to which was added the interest and depreciation on the company's steam plants, held in reserve, amounting to 0.8 cent per kilowatt-hour, and thus making the total cost of power to the railway company 2.66 cents. A further condition of the contract was that the railway company should maintain the high-tension line in good condition, but little work had to be done on this in the early years of the contract.

Owing to the fact that the load factor was at times much below normal and that the machine loss was large in the substation installation, the central station found itself unable to furnish power under this contract during certain hours at a profit. The railway claimed also that the service did not attain a standard which would enable it to maintain its schedules at all times. In 1916, when the original contract had eleven years more to run, the Northern Massachusetts company and the Athol company entered into a new contract, extending to 1927, upon a basis which would allow a larger profit to the central station and thus give it the incentive to furnish an improved power supply. As the result of this new arrangement the former troubles have been eliminated and the power supply is now continuous and satisfactory to the managers of the railway.

Under the new contract the cost of power to the road (which has about 31 miles of track), less a discount for payment of bills within fifteen days, is fixed at 1.84 cents per kilowatt-hour, and the energy is measured as alternating current. The railway assumes all converting and machine losses. These amount to at least 20 per cent in the case of this road, or 0.36 cent per kilowatt-hour. Adding interest and depreciation on the cost of the railway company's stand-by steam equipment increases the cost 0.8 cent per kilowatt-hour, making the total cost to the railway 3 cents. The central station took over the transmission line at a cost of \$36,-

000 in making the new contract. The Athol company purchased part of its energy from the New England Power Company at about 1.1 cents per kilowatt-hour and resold as above outlined.

DATA ON RURAL ELECTRIC SERVICE IN WISCONSIN

Analysis Shows How Business Is Handled, Under What Conditions It Is Profitable and Its General Trend

The report of the committee on rural service of the Wisconsin Electrical Association, of which the chairman is A. C. Babson of Watertown, for the year ended Dec. 31, 1917, covered the following points: the number of utilities in the State of Wisconsin serving rural customers and the standard methods of making extensions to serve them; the connected loads, transformer capacities and annual revenues; rural business increase or decrease during the year 1917, and evidence indicating whether this class of business is or is not desirable and profitable.

An analysis of Table I, which covers reports from twenty-six companies, brings to light the following facts: First, in a moderate majority of cases the farmer pays for the extension of primary lines; second, the cost of transformer installations is carried by the farmer in less than one-half the cases reported and by the company in the remaining cases; third, in about one-half the cases the farmer pays for the extension of the secondary lines; fourth, in a majority of cases no refund on the cost of the extensions is made to the farmer where he has contributed to the expense of such extension; fifth, in about one-half the cases single-phase motors only are provided for on rural extensions and provisions for motors rated at more than 5 hp., single-phase, are exceptional; sixth, in a majority of cases lines have not been constructed exclusively for rural-service customers, but have been extended from city lines into well-settled suburban or rural districts—a considerable portion of the rural customers obtain service from low-voltage transmission lines, where the transmission voltage (up to and including 6600 volts) is stepped down direct to 110 or 220 volts; seventh, reports as to whether this class of business is considered profitable or not are divided about equally, yes and no. The average selling price per kilowatt-hour is 6.9 cents. It is interesting to note, however, that this figure is obtained with an average transformer capacity per customer of 1.6 kw. and an average connected load per consumer of 1.4 kw.

Table II recapitulates the findings of the committee in condensed form and compares the findings with those of 1916. The following inferences may be reasonably deduced from the data shown: First, there is an apparent increase in the number of companies furnishing rural service and in the number of rural consumers;

second, the reported maximum distance of distribution has decreased, indicating an increase in saturation; third, a decrease in total kilowatt-hours consumption, but an increase in total operating revenue, the decrease in consumption being due to one of the largest companies reporting 217,000 kw.-hr. less consumption in 1917 than in 1916, and the consumption in general showing an increase; fourth, a slight decrease in connected load and the same step-down transformer capacity per consumer but a noticeable decrease in the average revenue per consumer, which, on account of the greater consumption per customer, would indicate a greater use of the connected load but a lower average rate; fifth, an apparent increase in the kilowatt-hours sold per kilowatt of transformer capacity, which would indicate also a tendency toward greater use of the connected load; sixth, an apparent increase in revenue per kilowatt of transformer capacity, even though at a lower rate per kilowatt-hour, would also indicate a greater use of the connected load.

It should be noted that in computing the units under the last three headings of Table II figures were used only where both component parts of the desired unit were reported. This method gives a reliable unit for all companies reporting the necessary information to compute a given average unit.

Several of the largest electrical utilities of the State, including such as the Milwaukee, Madison, Racine, Kenosha and Waukesha companies, have not as yet indulged extensively in the rural service experiment. The new schedule adopted by the Wisconsin Gas & Electric Company, referred to in last year's report and first applied in the Watertown division during 1917, promises to give fair results owing to the reasonably high minimum monthly charge. Eleven farms were

connected up during the year and more are preparing for connections.

Owing to a general retrenchment of all companies in the programs of capital expenditures during the last

vice near existing lines may proceed because of the shortage and demands of farm labor.

Finally it appears to the committee that: First, the construction of purely rural service lines is not ordinarily warranted unless the saturation of service is such that a reasonable return on the added investment and sale of energy may be shown; second, rural service consumers on transmission lines of not more than 6600 volts connecting towns or villages are ordinarily profitable if a suitable minimum charge is made; third, a suitable minimum charge to cover the higher cost of service for rural consumers should be made, variously estimated at from \$2 to \$3 or more per month; fourth, a low second step in the energy rate should be provided so as to encourage a sufficient use of the service by the farmer to make it practical and attractive to him.

ADVERTISEMENT SERIES ON PUBLIC RELATIONS

Vancouver (B. C.) Electric Railway Property Runs Sixteen Frank Talks of Broad Character in Local Newspapers

Under the title "Your Electric Service," the British Columbia Electric Railway Company has published a booklet containing a series of talks on electric service which appeared in the daily papers of Vancouver. The talks, sixteen in number, appeared under the following heads: "Servants of the Public," "Our Business Policy,"

"The Investments for Your Service," "Service at Cost," "Down to Bed-Rock," "A Statement of Finance," "Lower Rates Coming," "Your Street-Lighting Bill," "What Your Service Costs," "Equalizing the Load," "Electric Service Quality," "Striking an Average," "Local Conditions Count," "Preparing for the Future," "The Fixed Costs of Your Service," and "The Future Co-operation."

Three of the talks are reproduced here to show the frankness of this company in its public statements.

APPLIANCE SALES COMMISSION FUND FOR THE SALESPeOPLE

Washington Company's Policy of Distributing Percentage of Profits Develops Organization Spirit and Co-operation

To give an added impulse to appliance sales this year, the Potomac Electric Power Company, Washington, D. C., is setting apart a 5 per cent commission on everything sold out of the electric shop which is paid into a monthly fund and distributed to the members of the sales department. This distribution is made by equal division; that is, if the profit for the month is \$250 and there are ten salesmen on the staff, each one receives a check for \$25. It is found that this is aiding materially in the development of an organization spirit because of which the men are co-operating eagerly and "tipping each other off" to opportunities discovered outside the discoverer's own territory.

Our Business Policy

You've met some people who could not see the wood for the trees.

Well, a public utility company is like the wood with a lot of people. Because of the wide ramifications of its business and the multitude of little questions that arise, people are apt to forget what a public utility is for.

Isn't it to give the public service? Everything else works in that direction. Nothing else counts—even the return the investor gets works for the public service.

The policy of the B. C. Electric is to give the public the best possible service at cost.

What comprises cost may be summed up in these items:

The employees of this company are entitled to good wages so that they may live comfortably and so that the company may keep the best workers with it.

The company ought to receive sufficient for its service to keep its equipment strictly up-to-date so that the service may not deteriorate and enough to pay for accidents and contingencies.

The investor must receive a fair return on the capital he has honestly and prudently put into the business. The company must be able to pay its fair share of the cost of government, but not more than its share.

The price of this company's public service ought, in the public interest, to enable it to meet all these charges—public service commissions have so ruled.

We will welcome the appointment of a public service commission but our policy of giving service at cost will be maintained, commission or no commission.

B.C. Electric

Service at Cost

The public should receive public service at cost.

In making this statement we are not voicing any altruism nor hiding anything behind a meaningless remark. Public service commissions rule that the public shall not be exploited; that public utilities shall not compete; that they shall not make exorbitant rates of return.

But these commissions agree that the cost of service includes a fair rate of return, for otherwise the public would suffer through poorer service. Let the commissions explain the reason:

"If the rates fixed by the commission will yield only a return insufficient to attract capital into needed public service, it is THE PUBLIC and not the investor who will suffer"—Oregon Public Service commission.

"The interest of THE PUBLIC demands that carriers engaged in inter-state commerce, if properly constructed and wisely managed, shall receive revenue which will enable them to keep their property and equipment in good repair and maintain their service at the highest point of efficiency"—Interstate Commerce commission.

"What is a fair rate to meet the above annual charges and say a fair return on the investment? It should be a rate which, when applied to the probable output of the company, will produce a revenue sufficient to yield such a dividend on an amount of capital exactly equal to the fair value of the property as will induce others to invest capital in similar enterprises with the expectations of getting their recompense from the normal earnings of the enterprise"—Maine Public Utilities commission.

"The public cannot reasonably demand rates so low that the defendant's income may be reduced to the point where there would not be a sufficient earning to enable it to provide for necessary facilities to take care of THE PUBLIC DEMAND for service"—California Railroad commission.

"These facts tend to show that the burden upon the commission is to constantly promote efficiency in the way of granting a return to utilities which will induce them to place in operation modern appliances as they are put upon the market"—Wisconsin Railroad commission.

To sum up: Efficient service, which even before cheap service, is the purpose of a public utility, demands a fair return being paid on the investment.

B.C. Electric

Equalizing the Load

The cost of electric current depends a lot on how fast you use it. If you wanted 10,000 gallons of water in an hour, you would need bigger pipes and bigger pumps than if you spread out your 10,000 gallons over the whole day.

If you were to use 24 kilowatt hours of electricity evenly throughout the whole day, it would be much cheaper than if you took the 24 kilowatt hours in one hour.

Why? Because with the steady demand, a small machine, running constantly could keep you supplied whereas with the one-hour demand, a machine 24 times as large would be needed and it would lie idle the rest of the day.

In the first place, you would have a 100 per cent load-factor; in the second, a little more than a 4 per cent load factor. Our residence consumers use current on an average load factor of less than 8 per cent.

Fortunately there are other uses for electricity, such as for driving machinery, elevators and such like, although some of the demands such as for running street cars occur at the same time as the demand for lighting current and reduce the load factor still more.

But the more factories can use the generators as they lie idle between the "peaks" of the lighting and street car demand, the more they will earn to relieve these "peak" hour users. To this end, we offer reduced rates for factories that will take a steady supply of current. Of course, if there are not enough factories here, or if conditions are such that no matter how low the power rates are, they would not use electricity, the load factor will remain high.

The power plant starts under a handicap in the first place for its load factor is reduced 30 per cent, by the loss of current in transmission and transformation, before it reaches the city. All companies suffer in like degree.

The diversity factor is only one in the cost of current; as important is the demand, meaning the number of customers we can serve for the same outlay for poles and wires.

B.C. Electric

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Asynchronous Motors with High Power Factor and Controllable Slip.—R. V. PICOU.—Description of a method of improving power factor by the use of an asynchronous motor so arranged that it has a power factor practically equal to unity at all loads and that the slip can be controlled without sensible alteration of output. The machine can be used as a generator as well as a motor without the aid of auxiliary apparatus to give it an imposed frequency. The construction proposed permits a notable increase of the air gap without detriment to the motor characteristics—an evident mechanical advantage.—*Revue Générale de l'Electricité*, March 30, 1918.

Lamps and Lighting

Fundamentals of Illumination Design.—WARD HARRISON.—The writer deals with the subject in the following sequence: the candle, the mean spherical candlepower, the lumen, the foot-candle, the relation between the foot-candle and lumen, photometric measurements, including the horizontal photometer and the sphere photometer, and the calculation of the candle-power distribution curve. Concluding, he says: "In calculating the flux of light in various zones, we usually find it convenient to calculate for zones of 10 deg., and it is sufficiently accurate for most purposes to assume that the candlepower value at the center of each 10-deg. zone represents the average candlepower of the zone." He then gives the factors by which such candlepower values should be multiplied to give the lumens in each zone.—*General Electric Review*, May, 1918.

Generation, Transmission and Distribution

Questionnaire on Power Conservation.—Economies that can be effected in both hydroelectric and steam generating plants and information on present-day conditions in California are outlined.—*Journal of Electricity*, April 15, 1918.

Increasing Power Plant Economy.—C. T. BAKER.—Considerable saving may be effected by proper maintenance of apparatus, says the writer, who points out causes of high maintenance expense and suggests methods of preventing them.—*Power Plant Engineering*, April 1, 1918.

Canada's Water Powers and Their Relation to the Fuel Situation.—J. B. CHALLIES.—Water power must take a very prominent part, the writer points out, if the best use of the varied fuel resources of Canada is to be achieved. Furthermore, there must be evolved a national fuel policy which will permit the best possible co-ordinated and concomitant development and use of all the fuel resources in the Dominion. The relation of "white coal" to coal, wood, peat, oil and gas is gone into. The Pacific and Atlantic provinces are self-sustaining as regards fuel, but one area in Canada is largely dependent on imported coal. Canada is fortunate in the extent and location of her water powers, but only a

small portion, not 10 per cent, of Canada's available water power is developed. Summarizing the use of water power in Canada, the author says that about 78 per cent of the total power developed (1,348,490 hp.) is taken for municipal use, including domestic and ordinary industrial purposes; about 14 per cent (248,075

*Dominion Water Power Branch estimate, slightly revised. †A excludes Yukon and northern area unlikely to be immediately developed; B included in A is area actually settled.

ises great expansion, especially in the production of NiCu steel in Canada. The article also includes a diagrammatic representation of the Canadian coal situation and a statistical chart showing the fuel power resources of Canada.—*Toronto Electrical News*, April 15, 1918.

Traction

Four Improved Types of Electric Locomotives.—Traffic demands and economic considerations have brought about recent developments in electric locomotives which are described in this article. Performance characteristics and several drawings of the electric locomotive are included.—*Railway Electrical Engineer*, April, 1918.

Rolling Stock in the United States.—J. CARLIER.—An elaborate article well illustrated and covering many electric railways in America and also some in England. The author says that the economic future of European railways demands their Americanization, particularly as regards large cars, automatic power, standardized material and construction that minimizes hand work.—*Revue Générale de l'Electricité*, March 30, 1918.

Installations, Systems and Appliances

Transmission-Line Practice.—LIEUT. E. C. DRIVER and E. V. PANNELL.—Fifth installment on the subject, dealing with some problems involved in transmission-line construction and operation. Data are given on the spacings required with pin and suspension-type insulators for different voltages, the number of disks required in suspension insulators for different voltages under different weather conditions, and the maximum operating voltages which will not cause corona in fair weather.—*Toronto Electrical News*, April 1, 1918.

Automatic Substation.—R. J. WENSLEY.—The economies which have been effected in automatic substations adopted by the Ohio Electric Railway Company are discussed.—*Electric Railway Journal*, April 13, 1918.

Compression Rheostats.—ARTHUR H. ALLEN.—Carbon possesses the following properties which make it particularly useful for rheostats: (1) low internal and high contact resistance; (2) it is not readily oxidized; (3) it is imperishable; (4) it passes immediately from a solid to a gaseous state if raised to high enough temperatures and, having no plastic or liquid state, will not weld; (5) it is not affected by moisture, not readily acted upon by chemicals and not subject to corrosion; (6) its specific heat is high, and, when out of contact with circulating air, it will endure high temperatures approximating those of the electric arc; (7) its temperature coefficient is negative. The use of carbon in compression rheostats is discussed in this article.—*Journal of the Engineers' Club of Philadelphia*, April, 1918.

Electricity in the Silk Industry.—CH. VALLET.—The most important advantage of electricity in the weaving industry, the author says, is the almost perfect regularity of speed, which prevents the frequent breaking of the thread that is likely to result with the use of steam or gas engines. Speed regularity is not necessarily contingent on a constant rate of charge, and the degree of speed can be increased to a certain extent without many more broken threads resulting. Electric operation has brought about an increase of production ranging from 5 to 20 per cent, and it has made possible more compact installations, with a large saving in the cost of buildings, shafts and belts. The author examines at length the question of individual versus group operation. Speaking generally he holds that control by groups is preferable in a workshop containing a great number of

machines working in virtually identical conditions and in a uniform manner. This is the case in silk manufacturing.—*L'Industrie Electrique*, March 10, 1918.

Cincinnati's New Source of Electrical Energy Supply.—The condensers are set very low to reduce the amount of pumping necessary, and large overhead bunkers are avoided to reduce the amount of steel required in the building. The most radical departure is the location of the switch house over the turbine room. This construction permits extensions being made in several directions when necessary.—*Power Plant Engineering*, April 1, 1918.

High-Voltage Circuit-Breaker Details.—L. R. GOLLADAY.—High voltage necessitates greater insulation distance between the conducting parts and grounded tank, so large oil tanks are used. For the higher voltages the simple porcelain terminal bushings are not satisfactory and stronger and more effective condenser types are required. The higher voltages also make it necessary to have a greater travel of the moving contacts and wider separation of the fixed contacts. For this reason moving parts are heavy and there is difficulty in accelerating and decelerating them. A high rate of acceleration is desirable in order to reduce to a minimum the time the arc exists between the contacts. One type of oil circuit breaker which meets the requirements is described.—*Electric Journal*, April, 1918.

Designing and Operating Substations for Maximum Efficiency.—Apparatus standardization and the elimination of equipment not necessary for safe and reliable operation are the principal subjects discussed. Features of the Cedar Avenue substation of the Cleveland Railway are described.—*Electric Railway Journal*, April 13, 1918.

Electrical Reversing Rolling Mill.—The electrical equipment necessary for reversing rolling mills in steel works is described.—*London Engineering*, March 15, 1918.

Electrophysics and Magnetism

Lifting Magnets.—J. REYVAL.—A well-illustrated review of the different situations presented in the lifting and carrying of the materials of industry with respect to the manner in which electromagnets can be utilized for this work.—*Revue Générale de l'Electricité*, March 16, 1918.

Active Power and Reactive Power.—J. B. POMEY.—The author's object is to extend the known relations between active power and reactive power by means of vectorial calculations. He shows that the mean active electrical power is equal to the mean calorific power and that there is a constant relation equal to 4ω between the mean reactive power and the mean of the difference between the electrical energy and the magnetic energy.—*Revue Générale de l'Electricité*, March 2, 1918.

Terrestrial Magnetism.—L. B. BAUER.—The results of magnetic, atmospheric electric, terrestrial magnetic and terrestrial electric observations and other work done by the department of terrestrial magnetism are set forth in this article.—*Annual Report of Directory of Department of Terrestrial Magnetism*, Carnegie Institute of Washington.

The Sign of the Zinc Electrode.—WILDER D. BANCROFT.—With electrodes which form cations the electromotive force is a measure of the difference of the

chemical potentials, but the sign is opposite; with electrodes which form anions the sign is the same. Therefore, since the electrical potential of the copper in the Daniell cell is higher than that of the zinc and since the zinc electrode manifests the lowest electrical potential, though highest chemical potential, we ought to use the minus sign when speaking of the electrical potential difference Zn ZnSO₄.—Extract from a paper read before the American Electrochemical Society, May 3, 1918.

Electrochemistry and Batteries

Electrolytic Behavior of Manganese in Sulphate Solutions.—G. D. VAN ARSDALE and C. G. MAIER.—Manganese may be deposited at the cathode from neutral solutions with a high-current efficiency of 80 to 90 per cent and at pressures of 3 volts upward. The effect of increase of acidity is practically to prevent the deposition of Mn at a concentration of 0.36 per cent free H₂SO₄. The deposit is powdery, and ordinary expedients for improving deposition do not result in an appreciable increased efficiency. MnO₂ may be deposited at the anode at nearly 100 per cent efficiency. The effect of acid is to decrease the efficiency in cold solutions, but on heating to 65 deg. or 75 deg. C. there is a lesser effect. MnO₂ may be deposited from warm acid solutions containing more than 5 per cent MnSO₄ in the form of a dense, black, lustrous film at current densities up to 25 amp. per square-foot (275 amp. per sq. m.) with a high deposition efficiency. Impurities which are reducing agents cause a decrease in current efficiency in proportion to the amount present.—Extract from a paper read before the American Electrochemical Society, May 3, 1918.

Experimental Carbon Cell.—S. ALBERT REED.—A primary battery is described in which the electrolyte is fused borax containing manganese dioxide, the negative pole is broken carbon in contact with a graphite grid, while the positive poles are strips of gold foil. The air oxidizes the electrolyte in contact with the outer gold strips, while the carbon reduces the electrolyte inside. Mixtures of CO₂ and CO are produced at the anode. The emf. averages 0.8 volt with a temperature of 935 deg. to 990 deg. C.—Extract from a paper read before the American Electrochemical Society, May 3, 1918.

Calculation of Storage-Battery Capacities.—C. W. HAZELETT.—The development of a circular slide rule for calculating storage-battery capacities is discussed and methods of selecting the charging and finishing rates are suggested. The author points out that it is important that final voltages be standardized as a continuous function of the time rate of discharge in order that the critical point of sulphation shall not be exceeded and so that the drop of voltage in the cell due to sulphation shall be the same at the end of discharge regardless of the rate. In other words, it would be desirable to subtract from the practical final voltage used at the lowest current rates the drop in voltage due to a given time rate of discharge which cannot be attributed to sulphation. Good practice during many years of experience shows that 1.85 final volts per cell is entirely satisfactory at the lowest current rates.—Extract from a paper presented before American Electrochemical Society during its trip through the Southeast, May 3, 1918.

Units, Measurements and Instruments

Value of "g" in Engineering and Physical Work.—SANFORD A. MOSS.—The article deals with the gravitational factor in the following sequence: Standard value of *g*, accurate local values of *g*, actual values of *g* in the United States, the reduction of forces to standard values, the correction factor for latitudes in the United States, the correction factor for elevation, gravity in formulas including forces due to the earth's attraction, and an appendix giving a summary of methods of computing *g*.—*General Electric Review*, May, 1918.

Telegraphy, Telephony and Signals

Amplifiers in Telephony.—G. VALENSI.—The results obtained in the United States by the use of lamp amplifiers in long-distance telephony are reviewed, and the performance of these amplifiers, the different methods of using them, the types of relays and the modifications that the use of telephonic relays necessitate in a network are considered.—*Revue Générale de l'Electricité*, April 6, 1918.

Miscellaneous

Resistances for Starters and Controllers.—Methods of assembling resistance materials for starters and controllers are described in this article.—*London Electric Review*, Feb. 1, 1918.

Neutral-Tint and Variable-Tint Screen.—E. KARRER.—Neutral-tint screens which have high transmission coefficients suitable for use in a compact photometer are described.—*Journal of Franklin Institute*, April, 1918.

Industrial Electric Heating.—E. A. HOLLOWAY, J. B. BLACK and E. B. WALTHALL.—Data dealing with applications of electric heating apparatus are embodied in this article.—*Journal of Electricity*, April 15, 1918.

Midland Railway Company's Electric Fleet.—Data are presented to show the results obtained by the Midland Railway Company in operating seventy-six electric vehicles for the collection and distribution of merchandise in London and provincial centers. The vehicles have been tested on three classes of work, (a) long-

Book Reviews

THE PETROLEUM AND NATURAL-GAS REGISTER. Published by the *Oil Trade Journal*, 120 Broadway, New York City. 548 pages. Price, \$12.

This is a comprehensive directory of the petroleum and natural-gas industries, co-ordinating the various branches of the oil trade in the United States, Canada and Mexico. Names of officers, capital stock, location of properties and other valuable data are given.

INDUSTRIAL RESEARCH IN THE UNITED STATES OF AMERICA. No. 1 of a series of papers under the title "Science and Industry" and bearing on industrial research. By A. P. M. Fleming. London: Department of Scientific and Industrial Research of the British Government. 60 pages. Price, 1s.

We are wont in this country to complain about a lack of research facilities, but looking over this pamphlet one cannot help being proud of the quality and quantity of the research institutions and laboratories which, according to Mr. Fleming, exist in the United States. One feels that the author not only desires to give specific information to his British readers, but also intends to hold up this country as an example for them to follow. He divides industrial research into five groups: (1) Research applied to the elimination of manufacturing troubles; (2) research having some new and specific commercial object; (3) researches in pure science with no specific commercial application in view; (4) research applied to public service; (5) research for the purpose of establishing standard methods of testing and standard specifications connected with the purchase of raw materials. Some of the features of the research work of the laboratories connected with American industrial manufacturing corporations that impressed the author most forcibly are: (1) The installation in many cases of full-scale manufacturing facilities, which makes it possible to relieve the works of experimental developments and also gives the laboratory staff first-hand knowledge of the complexities of actual manufacture; (2) the growing tendency to devote more and more of the resources of the laboratories to pure science investigations with a view to making discoveries; (3) the growing appreciation of men with scientific training not only in the research laboratory, where such training is essential, but also in regular manufacturing employment; (4) the value of research laboratories as a means of inspiring confidence in the minds of customers and as an effective advertisement; (5) the employment of the laboratories by financiers for the purpose of ascertaining the merits of new industrial propositions of which the value has not been commercially established. The author describes the research laboratories of some twenty leading American manufacturers and their associations and also has chapters devoted to research work done by colleges, national institutions, private laboratories, etc. The last chapters are devoted to the selection and training of research men, co-ordination and distribution of scientific data, and the relation of research to the capitalist, the manufacturer and the educator. In the final chapter of the book the possible schemes for a better organization of industrial research in Great Britain are discussed. The book is profusely illustrated with photographs and will be read with interest by those inter-

ested in the actual status of industrial research in this country. It affords the additional advantage of seeing ourselves as others see us.

RADIO COMMUNICATION, THEORY AND METHODS, WITH AN APPENDIX ON TRANSMISSION OVER WIRES. By John Mills. New York: McGraw-Hill Book Company, Inc. 205 pages, 120 illustrations. Price, \$1.75 net.

This little red textbook is particularly useful in supplying much needed information for electrical engineers concerning the characteristics of vacuum tubes. In recent years and months there have been developed in a few special radio laboratories certain new vacuum-tube receivers, transmitters, oscillators, amplifiers and detectors; so that a particular branch of electric signal engineering that might be called vacuum-tube engineering has come into existence, with the manifest intention of staying and growing. This volume deals with the physical characteristics of these tubes in a quantitative way which appeals to the student. The book is also a pioneer in advancing the algebraic theory of oscillating-current circuits. The fundamental theorems of this type of circuit have already been propounded, but very few applications have hitherto appeared in textbooks. The method of presentation may not please every reader, however. The chapters of the book are devoted respectively to the following topics: Alternating currents, the telephone receiver, the vacuum tube, detection of high-frequency currents, production of damped sinusoidal currents, production of undamped high-frequency currents, radio-telegraphy and radiotelephony, practical appliances and methods of radio-telegraphy, transmission over wire circuits, and problems. The book will be useful to students of radio-telegraphy and radiotelephony.

Books Received

AIRCRAFT IN WARFARE. By F. W. Lanchester. New York: D. Appleton & Company. 222 pages, illustrated.

THE LANGUAGE OF COLOR. By M. Luckiesh. New York: Dodd, Mead & Company. 281 pages. Price, \$2.50.

ANNUAIRE POUR L'AN 1918. Published by the Bureau of Longitudes. Paris: Gauthier-Villars et Cie. Price, 2 francs.

Manufacturing Fields

USE OF ELECTRICITY IN PROPULSION OF SHIPS

W. L. R. Emmet Comments on London Cable Concerning Electrically Propelled Merchant Ship Construction in England—Our Great Progress

London cable advices published in the newspapers this week state: "The first electrically propelled merchant ship ever built in England and the largest electric vessel in the world is now undergoing its finishing touches at a British shipyard and will soon start on its first voyage."

The ELECTRICAL WORLD asked W. L. R. Emmet, consulting engineer General Electric Company, to comment on the foregoing. Mr. Emmet says:

"I had seen the paragraph which you quote, but know very little concerning it. Some time ago an electrically driven ship installation on a vessel called the Mjolner was made by Ljungstrom in Sweden, and later a number of such installations were planned. I do not know how many of these have been completed in Sweden, but I have been informed that rights for Ljungstrom designs were taken up in England some time ago and that electrically propelled ships with machinery built after his method were contemplated. I presume that this paragraph relates to one of these.

"I feel pretty sure that the statement that this is the largest electrically propelled vessel must be erroneous. The United States collier Jupiter, equipped with electric propelling machinery designed by me, was put into commission in February, 1914. The Jupiter is 542 ft. long and of 20,000 tons displacement; her propelling machinery develops normally 7000 shaft horsepower and can be operated at considerably larger power.

"The United States battleship New Mexico, of 32,000 tons displacement and 36,500 shaft horsepower, has just been completed at the New York Navy Yard and will make her trial trip within a few days. In addition to these, we have contracts for electric propelling machinery for three other battleships of similar size and power, the California, the West Virginia and the Maryland. We also have contracts for machinery for three battle cruisers of 32,000 tons displacement and 180,000 shaft horsepower each.

"In addition to this machinery for the navy, we are building electric propelling machinery for two cargo boats which are being built by the Pennsylvania Shipbuilding Company. Each of these equipments delivers 3000 shaft horsepower.

"Some of the ship equipments are by far the largest electrical applications ever made. Each of the eight motors on one of the battle cruisers has four times the capacity of the largest motor previously built."

An article by Mr. Emmet, published in the ELECTRICAL WORLD of Jan. 6, 1917, gives general information concerning battle-cruiser installations, and a paper in

the *Proceedings* of the Society of Naval Architects and Marine Engineers for 1915 also discusses the advantages of electric drive for large warships.

FUEL ADMINISTRATIVE ENGINEER FOR PITTSBURGH

Thomas R. Brown Appointed by Federal Fuel Administration—Policy to Be Extended to All States and Districts

The Federal Fuel Administration has announced the appointment of Thomas R. Brown of Pittsburgh as administrative engineer for the Pittsburgh district. C. P. Billing has been appointed his first assistant.

These appointments were made as a preliminary step toward putting into operation a general plan for fuel conservation in power plants. It is expected that the Pittsburgh experiment will serve as a model for other states and districts and that the total saving in the country at large as a result of the movement will be between 25,000,000 and 50,000,000 tons of coal.

A personal inspection is to be made of every plant.

Classification and rating of every power plant will be based upon the thoroughness with which owners conform to the recommendations of the Fuel Administration on generation and use of power, heat and light.

An administrative engineer is to be placed in charge of the work in every state and district. It will be one of his duties to rate the plant upon information received from inspectors.

An Achievement for the Third Liberty Loan

George DeB. Greene, chairman advisory trades committee, presenting twenty-one-star honor flag to Theodore Beran, chairman electrical industries committee for Greater New York, which exceeded the quota by 1000 per cent.

PURPOSE OF THE TEST IN ELECTRIC WELDING FOR SHIPS

Extension of Electric Welding to Major Part of Shipbuilding Will, It Is Hoped, Show Economy in Time and Money

A report of the purposes and possible benefits of the ship-welding test now being conducted by the Emergency Fleet Corporation at the Federal Shipbuilding Company plant at Newark, N. J., under the direction of Arthur J. Mason, has been made to Charles Piez, vice-president of the corporation. The part which the committee headed by Prof. Comfort A. Adams as chairman has in this work was outlined in the *ELECTRICAL WORLD* of March 3, 1918, page 683.

REPORT ON SCOPE OF CONTEMPLATED WORK

The text of Mr. Mason's report follows in part:

The committee of which Prof. C. A. Adams is chairman has been enlarged and is active in bringing to bear all the knowledge and apparatus available.

Electric welding in its various phases has for years been employed in shipyards and in the arts generally, but for a number of reasons the work has been confined to odd jobs and repairs. The proposal to extend its use to the major part of ship construction has met with gratifying approval from the shipbuilder. It remains for us through this large test to demonstrate its economy in time and money and its adequacy to build a staunch ship.

The purpose of this test is to demonstrate these advantages—to do it in such a way that all may see and contribute, and finally to test the structure itself so completely that there will follow a heart-whole and unanimous belief in the method.

The test itself will take the form of building part of a hull at the Federal Shipbuilding Company's plant, Newark, N. J.

It has been necessary to design a ship to suit the material available, without encroaching on that needed for the regular ship construction at the plant. This has been done. The hull will have the outline, dimensions and strength conforming to the ships the Federal company is building.

It has been thought best to conduct the work at a site apart from the shipways, so as not to interfere with that program.

A 10,000-ton ship, costing \$2,000,000, now costs but \$70,000 to rivet. It must be plain that if electric welding only promises to modify this amount no very substantial gain offers.

Splendid benefits we all feel do offer themselves in the possible change in the whole régime of shipbuilding. Our test has in view abolishing or greatly diminishing:

1. The railroad journey from rolling mill to fabricating plant, when the latter is not at the shipyard.
2. The templet makers' work.
3. The markers' work.
4. The punching.
5. Much of the work of the fitters and bolters who flog and pull the pieces to fit on the ways. There lies in the above items an excellent likelihood to save a month's time in construction and a saving of no less than \$40 a ton in the cost of steel structure, at least \$100,000 a hull on a 10,000-ton vessel.

Briefly the program is to assemble a hull rapidly by spot welding, tacking the ship together much as a tailor bastes his work in assembling a suit of clothes. The structure then becomes a house favorable for work in all weather and at night in which the completion of the ship may go on.

After the material is thus assembled and fastened with spot welds, so that it is sufficiently strong to hold its shape, the work is completed by arc welding all seams to insure strength and render the work watertight. Roughly we expect the spot welds to be about 10 in. (25.4 cm.) apart.

The preparation of the site is well under way; the pile driving will be completed within ten days. The severe tests of strength contemplated needed about 300 piles.

One quarter of the structure will be riveted, the other

three-fourths welded, so that the tests of strength will afford a basis of comparison.

Electric welding offers a great field for lightening a ship. In this design various views of this opportunity will be tried out. The field here is very great—ultimately 10 per cent of the steel may be eliminated.

One derrick will bring material, the other derrick support the spot-welding yoke, whose function is to tack the material together, fastening the plates either to the frames or to the adjoining plates.

If one visits the ways at any shipyard, it becomes obvious that at any instant only a modicum of the men are for the moment at work. This is unavoidable under the present system. We hope to establish a plan of assembly with more continuity and less waiting on one another.

Only a fifth of the men on a hull are riveters. The spot-weld yoke will forthwith pull the parts to place with a much more vigorous agency than flogging and pulling to place by numerous bolts, now done by the other four-fifths.

The problems of fitting in place the parts of a hull are almost wholly problems arising out of the necessity to make

PART OF SHIP'S HULL THE PLATES OF WHICH ARE BEING JOINED PARTLY BY RIVETING AND PARTLY BY WELDING

a number of little holes in a plate made by one man at one time and place fit a number of little holes made by another man at another time and another place.

Once all holes are left out of the material, all parts fit. The creeping and kindred problems so perplexing to the shipbuilder disappear. Every plate becomes a closer. Every plate justifies itself.

The manufacture of the spot-welding yoke and appliances is placed in the hands of the Universal Electric Welding Company of Long Island City. The design of the yoke is completed, the patterns are made and steel castings will be forthcoming in the next ten days. The early stages of the arc welding are to be accomplished by the Wilson Electric Company, which was so successful in the work on the German ships' repairs, but it is the intention to call in all men with ideas and apparatus and to give them a field to test out in actual work. To this end Professor Adams' committee is searching out all available talent.

An adequate system of testing the work when done is under consideration. The primary test will consist of filling the hull with water and shifting the points of support under continual and close scrutiny, as one-quarter of the whole will be riveted in the normal manner. There will be always a gage of comparison between this portion and the portion which is welded.

Likewise there will be a chance for comparison of the two forms when subjected to abuse by bumping with rams and in various other ways.

It is a pleasure to report on the strong interest and ready help extended by the Federal ship people, whose plant and organization we are using for the purpose.

ELECTRIC BRASS FURNACES DISCUSSED BY OHIO MEN

This and Other Topics Form the Program of Final Meeting of New-Business Co-operations Committee at Cleveland

The industrial power and heating section of the new-business co-operations committee of the Ohio Electric Light Association held its final meeting in the rooms of the Electrical League of Cleveland on May 8. Mathias Turner, assistant general manager of the Cleveland Electric Illuminating Company, welcomed the delegates. The first paper, "The Present Status of the Electric Brass Furnace," was presented by H. M. St. John, research engineer of the Commonwealth Edison Company, Chicago. The positive and negative features of this type of electric installation were ably brought out, and an interesting discussion was led by F. F. Bailey, president Electric Furnace Company, and E. F. Collins, manager industrial heating engineering department of the General Electric Company.

Judge Vickery of the Common Pleas Court delivered a patriotic address at the luncheon, following which, at the afternoon session, two papers were presented—"Motor Hook-Ups, a Comparison of the Methods of Silent Chain Belts and Gears," by Paul V. Wheeler, engineer drive chain department, Link Belt Company, Cleveland, and "War-Time Economies," by W. A. Wolls, new-business manager Columbus Railway, Power & Light Company.

ELECTRICITY AT THE HOG ISLAND SHIPYARD

At Boston Banquet W. H. Blood, Jr., Speaks of Large Quantity of Electrical Machinery and Material Required

The importance of engineering service in relation to war work was the keynote of the ninth annual banquet of the engineering profession at the Boston (Mass.) City Club April 30. C. M. Spofford, president of the Boston Society of Civil Engineers, presided, and James W. Rollins of Boston officiated as toastmaster. Among the speakers were Alfred D. Flinn, secretary of the Engineering Council, New York; Major-General Harry F. Hodges, U. S. A., commandant at Camp Devens, Mass.; H. O. Westendarp, General Electric Company, Boston; Mayor Andrew J. Peters of Boston, and W. H. Blood, Jr., American International Shipbuilding Corporation, Philadelphia, Pa. All the speakers recognized the necessity for co-operation among engineers for war service and their value in military and naval tasks.

The chief address of the evening, by Mr. Blood, was an illustrated talk upon the development of the Hog Island shipyard. In the course of his remarks the speaker touched upon the large quantity of electrical machinery and material required at Hog Island, said to be the largest shipyard in the world. This included the installation of 3,000,000 ft. of wire, 40,000 electric lamps, 650 motors, a telephone exchange of 12,000 stations, and a connected load of 41,000 hp. supplied by the service of the Philadelphia Electric Company. At present the yard is 70 per cent completed; about \$10,000,000 per month is being expended on its construction, and eleven ships have been started, of a total of 240 to be constructed as soon as possible, all of the fabricated

steel type. Mr. Blood emphasized the importance of being able to contract for central-station service in this case, some 30,000 hp. having been set aside at Philadelphia for this great plant, where there was not enough time in which to build a local station for the yard, even had the latter been desirable. During the evening the need was emphasized of engineers for certain branches of naval service to supervise the actual construction of anti-submarine devices developed by American physicists. About 300 engineers attended.

CANADIAN NIAGARA POWER POOLED FOR WAR PURPOSES

Steam Plants of Toronto Electric Light Company and Other Corporations to Be Operated to Speed Munitions Output

A Canadian order-in-council provides virtually for the pooling of Niagara power on the Canadian side of the border. Sir Henry Drayton, the Dominion Power Controller, has also made arrangements with the Toronto Electric Light Company, the London Electric Company, Ltd., and other companies whereby those corporations will resume operation of steam-power plants. The power will be at the disposition of the authorities until the needs of munitions and other essential industries are met.

It is reported that Sir Henry Drayton received assurances in Washington that sufficient coal would be made available without reduction of the allotment of coal to Canada.

Canadian officials in charge of the control of power and fuel have indicated in public statements that in all probability further restrictions will have to be placed on the use of light, power and coal by non-essential industries, merchants, storekeepers and private citizens.

It was also stated by the power and fuel control officials that people must expect to suffer some inconvenience from coal shortage next winter.

"DON'T BE IMPATIENT, BILL, YOU'RE GOING TO FEEL IT"

—Columbus (Ohio) Dispatch.

AMERICAN ELECTROCHEMICAL SOCIETY AT HOTEL TUTWILER, BIRMINGHAM, ALA.

ELECTROCHEMISTS FINISH THEIR TOUR IN THE SOUTH

Government's Nitrate Plants at Muscle Shoals, on the Tennessee, Are Inspected, and a Technical Session Is Held in Birmingham

The American Electrochemical Society completed its tour of Southern industrial centers with visits to Sheffield (Muscle Shoals), Birmingham and Anniston, Ala. Particular interest centered in the inspection of the government nitrate plants at Sheffield. One of these is to make use of the modified Haber ammonia process and the other of the cyanamide process. The final product of both plants will be ammonium nitrate. Plant No. 1, using the ammonia process, will have a capacity of 200,000 lb. of nitric acid per day and plant No. 2, using the cyanamide process, will have ten times the capacity of the first. In connection with plant No. 2, the Air Nitrates Corporation, which is directed by officers of the American Cyanamid Company, has been confronted with the problem of building and governing a city as well as constructing the technical plant. Thirteen thousand men are now employed.

LUNCHEON FEATURES AND TECHNICAL SESSION

As guests of the local committees at Sheffield, the party was taken to Lock 6 on the Muscle Shoals canal of the Tennessee River, where a barbecue dinner was served and a number of addresses were delivered explaining the proposed hydroelectric developments at Muscle Shoals, on the Tennessee River. Returning to Florence by boat, an informal reception was held at the Elks' Hall. At Birmingham on the following day the entire party was taken by automobile to the Ensley iron and steel plant, Tennessee Coal, Iron & Railroad Company, and later to Bayview Reservoir, where a barbecue lunch was served. Later in the day the new steel-plate plant at Fairfield was visited. This plant is being constructed especially for the manufacture of ship plates.

The technical session was held in the evening at the Hotel Tutwiler, Birmingham, following a complimentary dinner.

The final day of the tour was spent at Anniston, visiting the plants of the Southern Manganese Corporation and Anniston Steel Company. The former is manufacturing ferromanganese in the electric furnace, and the latter is making electric pig iron from scrap. These two plants are the largest electric furnace developments in the South.

FACTORY LIGHTING CODE OF STATE OF WISCONSIN

Industrial Commission to Make Rules Effective July 1 on New Work and Give Two Years to Bring Existing Work Up to Standard

Work on the factory lighting code of the Industrial Commission of Wisconsin has progressed to such a stage that it is now expected to make it effective on new work after July 1, 1918. If this plan is carried out, existing installations will be required to be brought up to specification within two years after that date.

As the code now stands it makes adequate lighting mandatory. Intensities at the work are specified. The code gives data on what the commission will require as minimum intensities and also gives higher intensities as "recommended practice." These data are based on practice that has been found satisfactory. In its studies the engineering force of the commission has been able to bring out data to show that increased production has resulted from the installation of adequate lighting. Other features of the code are that it makes a provision against glare and also one for uniform distribution. Maintenance of lighting systems is provided for.

CONSERVATION OF TIN IS NECESSARY AS WAR MEASURE

General War Service Committee of the Electrical Manufacturing Industry Warns Manufacturers of Danger from Shortage

A bulletin to electrical manufacturers, issued by the General War Service Committee of the Electrical Manufacturing Industry, contains a warning to conserve tin. Stating that the government has assumed control of the importation and distribution of tin, the committee adds: "Demand is made that the use of tin cease for all non-essential purposes and be reduced elsewhere to the minimum consistent with the production of material and apparatus which will function safely and satisfactorily."

If electrical manufacturers are to obtain their supply of tin, the committee says, it will be necessary for every one to economize to the fullest extent possible.

Suggestions are made for reduction in the consumption of tin to the necessary minimum. "The war needs of our industry in this respect are fundamental," the committee concludes, "consequently your immediate, active co-operation is of vital importance."

GOVERNOR OF MAINE ON WATER POWER CONDITIONS

Governor Milliken Tells "Electrical World" that He
Favors Development—Wants Investigation
and Constructive Public Policy

Proposed state ownership of water-power developments in Maine has reached a snag in Governor Milliken's firm decision to call no extra session of the Legislature to consider this subject, it was learned last week at Portland. At the Republican state convention in Portland in March Representative Baxter tried to further the cause of public ownership along the Ontario plan, but the proposition fell flat in face of the heavy cost of public development, especially under war conditions. There seems to be no general demand for an extra session at this time.

Speaking of the water-power situation to a representative of the *ELECTRICAL WORLD*, Governor Milliken said:

"A rapid and complete investigation of the whole subject of water-power development, leading to a constructive public policy, is of vital importance at this time. The value of water power as a great natural resource is emphasized by the present uncertainty and scarcity of the fuel supply. Discussion of the problem of development is important and exceedingly timely. So far as existing laws give us authority, we are compiling information regarding Maine's water-power resources with some attention to cost of development. The next Legislature should provide sufficient funds to insure a prompt and exhaustive report."

The Governor believes that the State should retain its water-power within its own borders for the use and benefit of its own people, this having been the settled policy of the Republican party within the State since 1909. The *ELECTRICAL WORLD* is in a position to state, however, that the opinion is taking form in Maine that the exportation of surplus hydroelectric power, when available, should be permitted, in view of the economic advantages of interconnection among transmission systems. Governor Milliken fears the exploitation of Maine water powers for their own profit by interests outside the State, and said:

"It is argued against this policy that it delays development. The same argument was made years ago in regard to Maine's timber lands, and in the pursuit of supposed progress that valuable birthright was lost to the people of the State. It is better to develop our water powers slowly than to lose them altogether. It is my belief that all new charters of power companies should contain a clause forbidding the transmission of power outside the State without the express consent of the Legislature and that every existing power company asking for an amendment to its charter at any session of the Legislature should have this amendment added also.

"I will not approve any new water-power charter nor any material amendment to an existing charter without the addition of this clause. Within the State it is our plain duty to encourage the development of water power under conditions that will assure its availability for industrial and household use at reasonable rates without injustice to capital honestly and prudently invested in such projects."

The Governor is keenly aware of the economic value

of water power as brought out by the coal crisis of last winter. Already Maine has the highest per capita water-power development in the country and stands third among the states of the Union in total development. He is anxious to have the subject opened up to the fullest possible extent.

There is little doubt, in view of the coal shortage in the Northeastern States last winter, that water-power matters will receive a good deal of attention at the coming biennial session of the Legislature in 1919. At the last session the movement to sanction exportation of power attained considerable headway, and it seems likely that the issue will again be raised. Among the operating companies there is a tendency to favor exportation at least of surplus power, with interconnection and the possibilities of interchange during periods of non-coincident low water. It was ascertained last

GOV. CARL E. MILLIKEN

week that the federal government is studying the possibilities of interconnection among transmission and hydroelectric systems along the borders of Maine and New Hampshire as a war measure to meet any power shortage or unfavorable water conditions on adjacent streams in adjoining states. The power requirements of shipyard and munition plants are large in the aggregate, and the whole subject is tied in so closely with fuel conservation that it is a most vital one at this time.

INVESTIGATION OF WATER POWER BY MAINE PUBLIC UTILITIES COMMISSION

Through the courtesy of Judge B. F. Cleaves, chairman of the Maine Public Utilities Commission, the *ELECTRICAL WORLD* is permitted to outline the plans of the board for a special investigation of water powers, existing and potential, in the principal river basins of Maine.

This investigation will be conducted by the engineering department of the commission under the direction of its chief, Paul L. Bean, and is to be assembled in a report to the next Legislature. The investigation will be in four parts—first, a study of the principal rivers; second, a comprehensive treatment of the cost and selling price of steam, oil-engine and hydroelectric power; third, a survey of power uses and markets; fourth, the legal aspects of water-power development.

The river study, of particular interest to hydraulic

engineers, will cover such main topics as the determination of power at developed and undeveloped sites, determination of storage sites, increase in the economic capacity of Maine rivers and total power in the State developed and undeveloped. Under the second division the report will cover the cost of power from different types of prime movers, the relatively low cost of unit power by developing storage, the cost of electricity for lighting and power as shown by comparisons of contracts and rates, and the detailed cost of power production, including operating expenses and fixed charges. This section will be of special interest to bankers. The power market section, with emphasis upon Maine uses, will be of great interest to the layman, and the legal section will contain much valuable material on water-power rights.

This investigation, of course, will not exhaust the subject, and the need of appropriations to carry the study further and especially into the field of smaller powers will be clear at the coming session of the Legislature.

WATER-POWER CONTROVERSY IS BEING WAGED IN MAINE

Campaign Against State Ownership Is Begun, and the Claims of Its Advocates Are Vigorously Attacked in the Newspapers

To offset the agitation for the public ownership of water powers which has lately been revived in Maine, a vigorous publicity campaign has been opened in the representative newspapers under the auspices of most of the leading electrical utilities of the State. William M. Pennell of Portland has been retained to conduct the campaign, which is already attracting widespread interest.

In the first publicity matter of the campaign, printed as a signed advertisement, attention is called to the claim of the public ownership advocates (headed by Representative Baxter of Portland) that 1,500,000 hp. of water power is going to waste in the State and that most of this formerly belonged to the State. Emphasis is laid upon the fact that a great number of these sites were owned by individuals long before Maine became a state. The State never had any ownership in the powers on the Saco or Presumpscott River. Its holdings on the Androscoggin, if any, were confined to the upper waters near the Rangeley Lakes. On the Kennebec the State owned no powers south of Madison, and on the Penobscot no powers were ever owned by the State within 50 miles north of Bangor. The only powers the State could claim any interest in were those situated in the so-called "wild lands" district. When the State sold these lands it conveyed title to the powers therein. Several times in many instances these power have been conveyed, and the Supreme Court has established the validity of the titles.

Advocates of state ownership claim that the inadequacy of water-power development by private capital resulted in much unnecessary suffering by industries and by the general public during the period of fuel shortage last winter. As a matter of fact there were fewer shutdowns in Maine resulting from coal shortage than in almost any other state of the Union. For example, the mills of Lewiston and Auburn, with one exception, were able to run because of hydroelectric power.

This condition obtained at Bath, a large shipbuilding center; at Portland, where ships and munitions are being produced; at Westbrook, Sanford, Waterville, Skowhegan, Biddeford, Saco and other manufacturing centers where the mills were unhampered by the coal situation except in the matter of heating.

The contention of the public ownership advocates that the development of water powers under private control has been very slow during the last seven years is being vigorously denied by the utilities. During the last seven years the Azischos dam has been completed on the Magalloway River, storing 9,500,000,000 cu. ft. (266,000,000 cu. m.) of water and increasing the minimum flow of the Androscoggin River more than 100 per cent. The cost of this development was \$1,000,000. On the west branch of the Penobscot River the Ripogonus dam has been built, impounding 22,000,000,000 cu. ft. (616,000,000 cu. m.) of water, and thus adding greatly to the efficiency of all the water powers on that stream. The cost of this development was over \$1,000,000. These two developments will generate when needed more than 40,000 hp.

At Rumford Falls there is being developed added power to the amount of 18,000 hp. and at a cost of over \$1,000,000. On the Saco River during the past seven years there have been completed two of the largest developments on the river, viz., at Bonny Eagle and at Hiram, where the present installation of waterwheels equals 16,000 hp., with a reserve when needed of 4000 hp., at a cost of \$2,000,000. At Grand Falls, on the St. Croix River, there has been developed by the St. Croix Paper Company 8000 hp., with an added reserve capacity of 4000 hp. The expenditure at this development was more than \$1,000,000. At Oakland the Central Maine Power Company is developing 3000 hp., and during the last seven years it has expended \$3,500,000 in increasing the capacity and the efficiency of its plants. The Portland & Lewiston Interurban Railroad, using the surplus power of the Androscoggin Electric Company, was built and placed in operation during the last seven years at a cost of more than \$1,000,000. A total of over 90,000 hp. has been developed during the last seven years, instead of less than 50,000 hp., as asserted by the public ownership advocates. But for the war conditions a 14,000-hp. development would also have been made at Clark's Rips, on the Androscoggin River, a task which will be performed as soon as normal conditions again obtain.

One of the contentions of the advocates of public ownership in Maine is that there is enough undeveloped water power to heat and light a large percentage of the homes of the State by electricity. The utilities are criticised by these interests as being behind the times in regard to the development of house heating by hydroelectric energy. The rejoinder of the utility companies points out that a residence burning 10 tons of coal for heating would consume about 60,000 kw.-hr., and at a price of from 1 cent to 3 cents per kilowatt-hour the cost would therefore be from \$600 to \$1,800 for the period. Tests have shown that it requires at least 13.5 kw. to warm a dwelling of six rooms. There are probably 160,000 dwellings in Maine averaging six rooms each, and if all the undeveloped power which could be developed in the State were used to heat houses only, there still would not be sufficient energy to heat one-fourth of these dwellings.

Home-Made "Tank" Central Station's Liberty Loan Parade Feature

In the recent parade on behalf of the third Liberty loan at Portland, Me., the Cumberland County Power & Light Company made a decided hit by contributing an imitation "tank" to the pageant. The "tank" was designed by H. J. Howarth, superintendent of the meter department and L. G. Scott, superintendent of underground construction.

WAR POWER PROBLEMS MET BY CALIFORNIA COMMISSION

**Necessary Construction Recommended to Conserve
Fuel Oil and Assure Further Development
of Hydroelectric Resources**

The California Railroad Commission has rendered a decision in the matter of the construction and operation of electric utilities during the emergency created by the war, as applied to the transmission and sale of power from the California-Oregon Power Company and the Northern California Power Company to the Pacific Gas & Electric Company. The commission has fixed the following rates for power to be delivered:

California-Oregon Power Company—Delivery to Northern California Power Company at Kenner.

Guaranteed delivery and purchase, 8500 kw. at 70 per cent load factor, equivalent to 52,122,000 kw.-hr. a year.

Rate (3.75 mills a kilowatt-hour) a year, \$195,500.

Energy delivered in excess of 8500 kw.-hr. at 70 per cent load factor, 52,122,000 kw.-hr.

Rate, 2.75 mills a kilowatt-hour.

California-Oregon Power Company and Northern California Power Company—Delivery to Pacific Gas & Electric Company at Colusa.

Guaranteed delivery and purchase, 8000 kw. at 70 per cent load factor, equivalent to 49,056,000 kw.-hr. a year.

Rate (4.9 mills a kilowatt-hour) a year, \$240,000.

Guaranteed purchase of maximum of 4000 kw. additional on a basis of 50 per cent annual load factor, based upon the average peak available supply throughout the year at Colusa in excess of 8000 kw.

Rate: All additional energy in excess of 70 per cent guaranteed load factor on 8000 kw., 3.5 mills per kw.-hr.

It is also recommended: that the California-Oregon Power Company and the Northern California Power Company enter into agreements for the transmission and delivery to the Northern California Power Company of 8500 kw. at Kenner; that the California-Oregon Power Company, the Pacific Gas & Electric Company and the Northern California Power Company enter into agreements for the transmission and delivery to the Pacific Gas & Electric Company at Colusa of 8000 kw., together with excess power as set forth in the commission's decision and according to the rates fixed for the delivery.

It is further recommended that the several companies take immediate steps to conclude such agreements or

contracts and to construct the transmission lines and substations required for the delivery and utilization of such power at the earliest time commensurate with economy of construction.

The investigation in general was instituted by the Railroad Commission on its own motion to determine the special needs of electric utilities in the war crisis and to enable the commission to render prompt service to the government, the utilities and the public so that there should be no shortage or interruption of service to industries.

The investigation so far made has been directed principally to the matter of the conservation of fuel oil and the further development of hydroelectric power on the part of the electric utilities to prevent any shortage of power.

FIVE LARGE COMPANIES SERVE TERRITORY

More than a month ago the commission made recommendations as to conditions in the southern part of the State for certain interconnections and other improvements to meet growing requirements. The five larger companies serving in central and northern California are the Pacific Gas & Electric Company, the Great Western Power Company, the Sierra & San Francisco Power Company, the Western States Gas & Electric Company and the Northern California Power Company. These five companies generate practically all the hydroelectric power produced and sold in that territory.

The decision says:

The investigation made and the evidence presented in this case show that there is a shortage of hydroelectric power in the central part of the State; that none of the electric utilities have in progress of construction hydroelectric plants to meet the demand for power, which is increasing at an annual rate of approximately 25,000 kw. of demand and 150,000,000 kw.-hr. a year; that during the coming season less hydroelectric power will be produced than normally, due to the shortage in precipitation, and that all practicable means should be taken to conserve fuel oil and meet the necessary demands for power and thus not hamper the industries during the war.

Considering the continually decreasing oil storage in California and the threatened shortage which may occur, it behooves the electric utilities to do all that they reasonably can to keep their consumption down to a minimum, and assistance should be given to them in so far as practicable to increase the utilization of existing hydroelectric facilities and the further development of plants as soon as this is possible.

Investigations in connection with this matter show that the California Power Company has completed a hydroelectric plant known as Copco, near the California-Oregon line, with a capacity of 10,000 kw., which is not at present needed for the local requirements of that company, and further, that the Northern California Company has a surplus capacity of approximately 4000 kw. during the seven months of the year from October to April inclusive. Provided the companies can finance the required transmission facilities to deliver this power to the Pacific Gas & Electric Company, this additional power, representing approximately 60,000,000 kw.-hr. a year, delivered to the Pacific company could be made useful in meeting the growing requirements for power in the bay districts and reduce the oil requirements approximately 240,000 barrels a year.

Various plans were proposed to make use of this power, but on account of financial difficulties and rate controversies these were not accepted. Finally the following proposals were arrived at, on recommendations made by L. S. Ready, acting gas and electrical engineer of the Railroad Commission:

1. The California-Oregon Power Company to reinforce and reconstruct its transmission line from Copco to Costella and construct a 70,000-volt line from Costella to Kennet of sufficient capacity to transmit to the Northern California Power Company at Kennet 8500 kw. Estimated cost, \$330,000.

2. The California-Oregon Power Company to finance the Northern California Power Company to the extent required to reinforce that company's lines from Coleman to near Hamilton by the addition of No. 0 copper conductor to the west line so that there can be delivered throughout the year to the Pacific Gas & Electric Company at Colusa 8000 kw. Estimated cost, \$110,000.

3. The Pacific company to construct a 60,000-volt transmission line of sufficient capacity from Colusa Corners, near Colusa, to Drum-Cordelia. Estimated cost, \$440,000. A 100,000-volt line and install a substation of 12,000 kw. rating, from 60,000 volts to 100,000 volts, to deliver the power into that line. Estimated cost, \$200,000. Total estimated cost, \$640,000.

The Pacific company will be required to re-route the power from certain of its existing plants over its Wise-Stockton Mission-San José line to the southern district. This line is under construction at the present time and will be completed by the time power can be delivered at Colusa.

A general understanding was reached as the result of conferences as to the amount of power to be delivered and purchased, as follows:

1. The California-Oregon company is to guarantee to deliver at Kennet to the Northern California company, and the latter company to agree to take for transmission south, 8500 kw. at 70 per cent load factor.

2. The California-Oregon company and the Northern California company are to agree to deliver to the Pacific company at Colusa Corners 8000 kw. at 70 per cent load factor throughout the year.

3. The Northern California company is to agree to deliver to the Pacific company during the months of October to April inclusive 4000 kw. at 50 per cent seasonal load factor.

4. The Pacific company is to agree to purchase and take from the Northern company a minimum of 8000 kw. at 70 per cent load factor for twelve months and 4000 kw. at 50 per cent seasonal load factor for the seven months.

5. The agreements were to be incorporated in a contract to run for ten years, with the right to apply for change of rate in five years. It was further understood that the Northern California Power Company's delivery of power to the Pacific company at Chico, under contract relations, should in no way be affected by this contract.

The result of the above agreement, if carried out, will be the purchase by the Pacific company of a minimum of 59,000,000 kw.-hr. a year. This will represent an oil conservation of approximately 240,000 barrels a year.

SALE AND PURCHASE PROVISIONS

Under the proposed rates and agreements of sale and purchase, the California-Oregon company is to deliver to the Northern California company at Kennet a minimum of 52,122,000 kw.-hr. a year, equivalent to 8500 kw. of 70 per cent load factor, for \$195,000, and for energy supplied in excess of that amount to receive payment at the rate of 3.75 mills a kilowatt-hour. This power is to be transmitted by the Northern California company to the Pacific company at Colusa, where it is to be delivered at the minimum of 8000 kw. of 70 per cent load factor, equivalent to 49,056,000 kw.-hr. a year, for an annual payment of \$240,000. In addition to this amount, the Northern California company agrees to deliver the surplus power to a maximum of 4000 kw. to the Pacific company, and the Pacific company agrees

to purchase that power at a load factor based upon the average available peak of 50 per cent. All power purchased in addition to the minimum guarantee of 49,056,000 kw.-hr. to be at a rate of 3.50 mills a kilowatt-hour. Under this proposed agreement there should be delivered to the Pacific company at Colusa a minimum of 60,000,000 kw.-hr. a year, which will represent an oil conservation of at least 240,000 barrels a year.

OPERATING CONDITIONS OF SAN FRANCISCO COMPANY

Heavy Loss in Net Operating Revenue of Pacific Gas & Electric Company Due to Operating Expenses

At the recent annual stockholders' meeting of the Pacific Gas & Electric Company John A. Britton pointed out that the reason for the heavy loss in net operating revenue last year lies in the operating expenses of all departments. There was an increase in the maintenance of properties over 1916 of \$82,000, in operation of \$1,613,863, and in taxes and administrative expense of \$349,939, or a total increased expense of \$2,045,808 against increased revenue of only \$1,197,883.

In the electric department the average revenue per consumer in 1916 was \$56.54 as against \$55.87 in 1917. The electric construction costs during the year were \$853,041 net, or \$61.20 per consumer obtained. The cost per kilowatt-hour, including generation by water and steam, was 1.81 mills in 1916 and 2.55 mills in 1917, an increase of 0.74 mill. The increase in oil costs alone would have amounted to 0.76 mill, or more than the total increase, economies in other ways reducing the net loss to 0.74 mill.

The average of operating and maintenance expenses per kilowatt-hour increased from 6.9 mills in 1916 to 7.3 mills in 1917, an increase of 0.4 mill. In this time the cost of oil increased 0.89 mill per kilowatt-hour, showing that a compensating decrease in expenses had been made. Oil prices and water shortage, Mr. Britton pointed out, were responsible for the entire increased cost. The ratio of average load to plant capacity in 1916 was 53 per cent as against 46 per cent in 1917. This reflects the shortage of stored water and affected 74,000,000 kw.-hr., having a value in oil of \$500,000.

Reference was made to the 15,000-kw. turbine for Station "A" in San Francisco, which is to be delivered about the first of next year, and to the possibility of a tie-in with the California-Oregon and Northern California Power Companies. These improvements to the system will cost approximately \$2,000,000. With these extensions, Mr. Britton said, all demands on the system that may be deemed by the government of a necessary character could be met.

Workmen injured in the course of their employment in 1917 numbered 673, and the average cost per employee was \$8.53, as against \$9.34 in 1916. The cost of these accidents was less than one-half of 1 per cent of the year's gross earnings, while if casualty and compensation insurance had been carried, the cost would have been approximately \$225,000, or 1.4 per cent. The total number of accidents to employees and other persons was 1908, a decrease of 351 over the previous year.

To Speed Aircraft Production

JOHN D. RYAN

John D. Ryan, president of the Montana Power Company and the Anaconda Copper Mining Company, has been appointed, Secretary of War Baker announces, director of aircraft production for the army.

THE LARGER PROBLEMS OF OUR FOREIGN TRADE

M. A. Oudin Discusses "American Economic Interests in the Asiatic East" at Fifth National Foreign Trade Convention

An address on "American Economic Interests in the Asiatic East" was made by M. A. Oudin, manager foreign department, General Electric Company, before the Fifth National Foreign Trade Convention, Cincinnati, last month. Some of the remarks of Mr. Oudin, who has been in the East recently, follow:

America is not represented abroad by capital investments commensurate with her wealth. It is a problem in our foreign trade to find a sufficient number of Americans typical of our best home elements who are willing to live outside the United States and to make the furthering of our export trade their life's vocation. The consequence is that the American colonies in many foreign countries are small in numbers and constantly changing but relatively effective in developing markets for our products.

We must not blind ourselves to the fact that the pressure of economic necessity is the cause of nearly all wars. The present war is no exception. Precipitated by Germany in the expectation of extending its commercial opportunities, it has developed into a mad and desperate struggle on the part of that country for position—political, military and territorial—which with the coming of peace will enable its possessor to fasten its grip upon the world. So far the gainers have been the Central Powers, through their control of Belgium, parts of France, Russia, the Balkans, Roumania and the Transcaucasus. All the warring nations, except the United States, are purposely striving either to make or to retain a place for themselves in the economic sun. And this they are doing notwithstanding that they are engaged in a life and death struggle and that those who are fighting on European battlefields are spending billions of dollars and suffering an appalling sacrifice in lives.

In the United States there is a disposition to push aside all problems except the vitally important one of how to win the war. We are confident of the unselfishness of our motives and the disinterestedness of our aims. But no one can predict how far these policies and these principles will prevail at the peace conference. These principles must be backed up by more than a conviction on our part of their

high moral character, by more than powerful naval and military forces. We will invite embarrassment if we do not take stock of our economic and industrial and of our agricultural and mineral resources. We will court disaster if we unduly delay taking the necessary constructive measures for the improvement of our economic position. It is certain that at the peace table a knowledge of the exact state of our resources and those of our Allies and the possession of a strongly fortified economic position will be trump cards. They will help us secure a better peace for ourselves and for the world, in which our rôle is that of a leader of democratic peoples.

The maintenance after the war of the relative commercial opportunities of the nations as they existed at its commencement may help to postpone a future war by removing one of the principal causes of war. For the time being, however, the power of might rules in the world and no one can say for how much longer it will continue to do so.

There never was a greater need for sagacious and cautious statesmanship and for an enlightened public knowledge of world politics than in the present crisis of our country. So long as our people are unaccustomed to think in international terms, American interests will be frequently set aside for a supposedly greater gain in some other and less material direction. There should be, in addition to this wider public interest in international affairs, a closer co-operation between our administrators and the people, or at least those of our citizens who are specialists in these matters. It is not too much to urge that our business men study world politics and world economics in order to arrive at sound opinions upon all questions internal as well as external which influence our interests overseas; next, that labor realize to what an unexpected extent its welfare depends upon a steady and permanent outlet for the product of its efforts, which may be insured by an extensive foreign commerce, and lastly, that the government of the United States, following the example of all of the other great commercial nations, freely seek out and confer with those of its citizens who, because of their special knowledge and experience, are qualified to give expert advice on the complicated questions involved in our international relations.

MR. FARRELL ON FUTURE TRADE CONDITIONS

In his address James A. Farrell, president National Foreign Trade Council and president United States Steel Corporation, made the following forecast of conditions after the war:

There can hardly be a question that for a good many years after peace is restored the rehabilitation of the vast territory wasted by the war and the replacement in neutral countries of equipment which has necessarily suffered from deterioration while replacements have been impossible will provide a large outlet for surplus production.

Whatever may be the eventual terms of peace, one conclusion would seem to be reasonably certain: We and our allies will have sacrificed our blood and treasure in vain if we have not succeeded in insuring hereafter conditions of peace under which we shall be free to carry on our domestic and foreign commerce without the fear of military dictation.

Gerard Swope, vice-president Western Electric Company, spoke at the convention on the best form of co-operation in the export field.

At a luncheon of the American Manufacturers' Export Association held at Cincinnati in connection with the convention E. M. Herr, president Westinghouse Electric & Manufacturing Company, said:

"We are facing as serious and critical a situation in our foreign trade, especially our foreign trade in manufactured products, as the nation faced at the sinking of the Lusitania, and are doing almost as little toward real preparation for the proper development of this trade as we did as a nation at that time in preparation for the terrible war in which we are now engaged."

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Synchronous Club, Los Angeles.—At the May 2 meeting J. M. Lee of the Los Angeles Bureau of Light and Power spoke on "Prime-Mover Economics."

International Association of Municipal Electricians.—The annual convention of the International Association of Municipal Electricians will be held at Atlanta, Ga., on Sept. 24 to 27.

Arkansas Association of Public Utility Operators.—The annual convention of the Arkansas Association of Public Utility Operators will be held at the Arlington Hotel, Hot Springs, Ark., May 21, 22 and 23.

San Francisco Electrical Development League.—At the May 1 meeting of this organization W. L. Goodwin outlined the plans which are being developed for organizing all branches of the electrical industry on a national scale.

Engineers' Society of Milwaukee.—J. J. Whelan, industrial commissioner, and V. S. Hillyer, construction engineer, of the Wisconsin-Minnesota Light & Power Company of Eau Claire, Wis., gave an illustrated lecture on the Wisconsin dam before the Engineers' Society of Milwaukee on May 8.

Joint Engineers Hold Meeting in Chicago.—At a joint meeting of the American Institute of Electrical Engineers, the Western Society of Engineers and the American Society of Mechanical Engineers in Chicago C. F. Kittering, president of the Society of Automotive Engineers, gave an interesting address on the "Automobile Power Plant."

A. I. E. E., Pittsburgh Section.—The May meeting of the Pittsburgh Section of the American Institute of Electrical Engineers will be held May 14 at the Chamber of Commerce auditorium. Dr. J. E. Sparks, president of the Pennsylvania State College, will present a paper on "Present Problems of Technical Education." This paper deals especially with army work.

Southwestern Electrical and Gas Association.—At the fourteenth annual convention of the Southwestern Electrical and Gas Association, a report of which was published in the May 4 issue of the *ELECTRICAL WORLD*, it was decided to hold local meetings of the three sections three times a year in different cities and so arrange these meetings that members near these cities can attend with small expenditure of time and money.

Wisconsin Association of Electrical Contractors and Dealers.—The need of co-operation between industries, the government and the public were emphasized by Burton Williams, internal collector of revenue for the Wisconsin

district, in an address at the banquet of the Wisconsin State Association of Electrical Contractors and Dealers held recently in Madison. Among the important papers presented at the two-day convention was one on "Selling Electrical Appliances on the Installment Plan," by R. B. Snyder, general sales manager for the Milwaukee Electric Railway & Light Company.

Joint Committee of Technical Societies of Southern California.—George A. Damon of Pasadena was elected chairman and W. K. Barnard of Alhambra secretary at a recent meeting of the Joint Committee of Technical Societies of Southern California in Los Angeles. This organization contains members of the branches of seven national engineering societies in southern California in one body of more than 1000 electrical men. The membership includes architects, electrical, civil, chemical, mining and mechanical engineers.

State Factory Inspectors.—At meetings of state factory inspectors of Pennsylvania and New Jersey recently Prof. C. E. Clewell of the University of Pennsylvania gave lectures on the "Specification of Quantity of Light," "Relation of Glare to Factory Lighting" and "Distribution of Light in Factory Spaces." The addresses dwelt upon the importance of quantity of light and emphasized various other important factors. The necessity of taking into account physiological as well as physical requirements, the allowance for the worst conditions, excessive variations of daylight and the practical measurement of quantity of illumination were also discussed. At one of the meetings G. H. Stickney, president of the Illuminating Engineering Society, outlined the various efforts which have led to the formation of factory lighting codes and the present status of such codes throughout the United States.

O. E. L. A. Transmission and Distribution Committee.—At the last conference of the season for the transmission and distribution men of Ohio, which was held at Youngstown recently, various Pennsylvania as well as Ohio companies were represented. R. R. Krammes of the Central Ohio Power Company presided at the meeting and introduced V. E. Goodwin, lightning-arrester engineer of the General Electric Company, Pittsfield, Mass., who gave an interesting address on "Protection of Electrical Apparatus Against Lightning." Mr. Goodwin answered various questions as to the operation and construction of the various forms of arresters, including the electrolytic arrester. In the discussion of Mr. Goodwin's paper it was brought out that the present form of electrolytic arrester is the best form of available protection against lightning. Another paper, "Overhead Crossings of Electric Light and Power Lines for Voltages Greater than 10,000 Volts," was read by M. H. Wagner, transmission and distribution engineer of the Dayton (Ohio) Power & Light Company. It showed that exacting and abnormal clearances are required by some railroads.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Negligence in Injury to Property.—A light and power company was liable for breaking a plate-glass window while installing a light if the damage was the proximate result of its negligence or that of its servants within the scope of their duties, not contributed to by negligence of plaintiff or its servants, it was held by the Court of Appeals of Alabama in *Birmingham Railway, Light & Power Company vs. E. & W. Dry Cleaning Company* (77 S. 922).

Loss of Profits Is the Damages Resulting from Cutting Off Current.—The true standard or test for determining the loss resulting from the impairment of a business by a cause readily remediable, as by the wrongful discontinuance of electric energy during eight months or less, primarily is not depreciation in rental value of the building occupied, the occupancy thereof not otherwise being disturbed, but rather loss of profits of the business therein conducted because of the interruption of the energy, the Supreme Court of West Virginia held, in *Chambers vs. Spruce Lighting Company* (95 S.E. 192).

Damages Collectible if Service Is Not Furnished When Promised.—A municipal corporation authorized by law to sue and be sued, contract and be contracted with, acquire, hold, possess and dispose of property, and to provide for the lighting of streets and furnishing the city or town and the inhabitants therewith with gas or other lights, as well as to allow the use of streets and alleys of the city to any person or corporation who might desire to establish works for supplying the city and its inhabitants with water or lights upon such reasonable terms as the council should prescribe, granted defendant corporation a franchise to erect poles and string wires in the streets of the town, the ordinance requiring defendant to give a bond conditioned that it should have a certain portion of its service in full operation within nine months after the grant of the franchise and should maintain it so as to furnish electricity adequate for light and power purposes. Defendant accepted the terms of the grant and accepted and executed its bonds, but failed to erect poles or in any way to comply with the requirement that it should have a certain percentage of its service in full operation within nine months. It was held by the Supreme Court of Oregon in *City of Grants Pass vs. Rogue River Public Service Corporation* (171 P. 400) that the municipality might without proof of any special or actual damages recover the amount of the undertaking.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

California Commission Expense.—The expense of conducting the California Railroad Commission is less than one-tenth of 1 per cent of the revenue of the utilities regulated by it.

Bureau of Mines Needs Trained Men.—Important chemical and other technical engineering work necessary for the prosecution of this war is being carried on by the Bureau of Mines experiment station at Washington, D. C. The services of trained men of several classifications, including electrical engineers, are urgently needed.

Denver's Committee on Safety and Efficiency.—One of the innovations of the Denver Gas & Electric Light Company is the committee on safety and efficiency, presided over by T. O. Kennedy, general superintendent, which meets monthly to listen to suggestions from all departments. A prize for the best suggestion is awarded. H. P. Tewksbury was a recent winner, his suggestion being that all departments be ordered to observe rigid economy in the use of electricity and gas for the further conservation of fuel.

Increased Rates at Fond du Lac.—The Railroad Commission of Wisconsin has rendered a decision in the application of the Eastern Wisconsin Electric Company to increase its electric rates at Fond du Lac. The company requested authority to apply a surcharge of 1½ cents per kilowatt-hour to all lighting and power bills, including bills for street lighting. The decision of the commission authorized a surcharge of ½ cent per kilowatt-hour to be applied against all lighting and power business for six months, beginning May 1.

Lighting Lectures Delivered to Pennsylvania and New Jersey Factory Inspectors.—The committee on lighting legislation of the Illuminating Engineering Society, under the chairmanship of L. B. Marks, has drafted and issued a code of factory lighting which has been used as a guide in the preparation of the codes of Pennsylvania and New Jersey. To promote a better understanding of the fundamental principles of the factory lighting codes now in force in these two states, the department of electrical engineering of the University of Pennsylvania, of which Harold Pender is professor in charge, co-operating with the State Labor Departments of Pennsylvania and New Jersey, arranged a series of lectures covering two all-day sessions for April 25 and May 9. Visiting inspectors were invited to look into the various laboratories of the electrical engineering department between the lecture sessions or to visit other buildings on the university campus.

Samuel Insull Speaks at Rockford.—Samuel Insull, president of the Commonwealth Edison Company and chairman of the State Council of Defense for Illinois, spoke before the Rockford (Ill.) Chamber of Commerce on April 24. During his stay in Rockford he also visited the National Army cantonment at Rockford, where he was conducted over the camps for an inspection of each of them by Gen. O. H. Martin and Lieut. Jack Eddy.

Large Turbine Overhauled After Long Run.—The Commonwealth Edison Company recently took down for inspection and overhauling its unit No. 3 at Northwest station. This unit is a 30,000-kw., 25-cycle General Electric compound unit. This was the first overhauling the unit had received since it originally went into service two and one-half years ago. It is interesting to know that during this length of time the machine generated 475,000,000 kw.-hr.

Cincinnati Rate Case.—City Solicitor Saul Zielonka of Cincinnati, Ohio, is seeking before the Ohio State Supreme Court to prevent the Public Utilities Commission from exercising jurisdiction in the electric light rate controversy. Mr. Zielonka had been notified by the commission that a decision on his motion to strike from its files the application of the Union Gas & Electric Company for a modification of the order fixing 8½ cents as the rate for Cincinnati would be withheld until after the hearing on the application. This motion raised the question of jurisdiction, and this is the reason for the appeal to the Supreme Court. The order for the 8½-cent rate was issued after the city and the company had agreed upon it, and the city solicitor contends that the rate should be binding under this agreement for the term of the ordinance, five years.

Priority in Kansas City, Mo.—The first denial of priority instructions on equipment for the Kansas City Light & Power Company new central station has occurred with reference to its turbines. It is believed in Kansas City that the denial is tentative. Since information regarding it has been received in Kansas City nearly all the large industrial plants using energy have written to the Washington authorities urging that the company be allowed to complete its plant, as their need for more energy is imperative. All of those which wrote are on "short rations" of energy, and nearly all are in one way or another in war commodity production, including mills, steel and iron working plants and plants making actual munitions or accessories to army equipment. Several plants which had planned their schedule of production with the expectation of getting electrical power within the year also represented their situation to the board. Erection of the company's central station is temporarily held up awaiting adjustment of labor difficulties. The company will complete all details so far as possible whether the turbines are released meanwhile or not, but a renewal of the priority order is of great importance.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Rates Found Too Low in Wisconsin.—Approving an increase in electric rates of the Cross Plains Electric Company, the Wisconsin Railroad Commission shows that analysis of the applicant's earnings and expenses indicates that for the year ended June 30, 1917, it failed to earn more than 5.3 per cent on its estimated value, and that the elimination of receipts from sale of fixtures, wiring, etc., would wipe out entirely the surplus available for returns during such year; that under the circumstances an increase in rates is justified. The company testified that it was losing money on farm consumers, owing to transformer losses. The greater percentage of profits has been from house wiring and sale of fixtures, a business it is no longer engaged in. In general, it was losing money because its light and power rates were too low in proportion to the cost of doing business. The commission authorized a new schedule of rates, which includes rates for commercial and street lighting, power service, rural service, and a penalty for failure to pay bills within ten days of date of bill.

Company Should Justify Higher Rates.—In declining an application of the Electric Light & Power Company of Burns for authority to increase rates, the Oregon Public Service Commission says: "In our opinion the market for electric energy in Burns will produce, under rates no higher than those now in effect and under conditions of adequate service and careful management, a return more reasonable in proportion to the investment necessary for such service than that now received. A request for an advance in rates is unreasonable and should not be considered until such time as the applicant can come before this commission and show clearly that it has made necessary provision to insure its patrons adequate service and that every possible opportunity has been accepted for increasing the revenue of the company by the development of such profitable business as may be available within the territory served by it. . . . Patrons display utter lack of confidence in the devices used for the measurement of the energy consumed, and the management itself does not by proper test or inspection keep itself sufficiently assured of the accuracy of this equipment in order that it may restore such confidence or defend its charges. In these and other respects the business methods of the management of this company are lax to such an extent as to eliminate the possibility of co-operation from the public."

Richard Eick has been promoted to the position of general agent of the Little Rock Railway & Electric Company.

Prof. Louis Vessot King of McGill University, Montreal, has been awarded by the Franklin Institute its Howard N. Potts medal for his improved method and researches in hot-wire anemometry.

C. C. Turley, for ten years manager at Vancouver, Wash., for the Portland Railway, Light & Power Company, has resigned to accept a position with the Utah Power Company at Salt Lake City.

William Marconi has been awarded the Franklin medal by the Franklin Institute. The medal will be presented on May 15 to Count V. Macchi de Celere, representing the Italian government, for transmission to Mr. Marconi.

W. L. Davis, until recently a traveling auditor on the staff of the American Power & Light Company of New York City, has been appointed auditor of the Lehigh Valley Transit Company, the Lehigh Valley Light & Power Company and affiliated companies at Allentown, Pa.

Prof. Thomas Corwin Mendenhall, physicist, former president of Worcester Polytechnic Institute and a United States delegate to the International Electrical Congress in 1893, has been awarded the Franklin medal by the Franklin Institute. The medal will be presented on May 15.

E. C. Vickers, assistant manager at Duquoin, Ill., has been promoted to the position of district manager of the Eldorado group of properties of the Saline Electric Company, a subsidiary of the Southern Illinois Light & Power Company, to fill the vacancy caused by the resignation of F. T. Morrissey.

Dr. A. E. Kennelly, acting head of the electrical engineering department of the Massachusetts Institute of Technology, has been awarded by the Franklin Institute its Howard N. Potts gold medal for his invention of the hot-wire anemometer and his application of this device to the measurement of convection from small heated wires.

O. W. Jones, commercial manager of the Texas Power & Light Company of Waco, Tex., has been transferred to Cleburne, Tex., as manager of the Cleburne district. Mr. Jones went with the company late in 1916, prior to that having been engineer of distribution of the Columbus (Ohio) Railway, Light & Power Company and later superintendent of the meter and distribution department of that company.

O. S. Maple, formerly purchasing assistant of the United States Shipping Board, Emergency Fleet Corporation, at Washington, D. C., has recently been appointed assistant purchasing officer of that corporation. Mr. Maple was formerly engineer on steam-plant design for the Fargo Engineering Company, Jackson, Mich. He joined this concern in the fall of 1916, going from the Texas Power & Light Company, for which he was assistant construction engineer.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

R. A. MacGregor has resigned as sales manager of the Merchants' Heat & Light Company, Indianapolis, to accept a position as sales engineer for the Lakewood Engineering Company of Cleveland in its Pittsburgh territory. Mr. MacGregor has become well known in the central-station industry through his connection since 1900 with such companies as the West Penn Company at Connellsville, Pa.; the C. H. Geist Company, Plymouth, Pa., and Chicago; the H. L. Doherty Company, New York, and the Connersville (Ind.) Light, Heat & Power Company. In the service of H. L. Doherty & Company, as sales manager of the Empire District Elec-

R. A. MACGREGOR

tric Company at Joplin, Mo., Mr. MacGregor and his sales force at one time made a record of closing 22,000 hp. of electric service in twenty months. As sales manager of the Merchants' Heat & Light Company he had charge of the construction and equipment of the company's appliance store, known as the "Daylight Corner," which is well known in the central-station trade as one of the modern electrical merchandise salesrooms of the Middle West.

Albert M. Grall, Webb City, Mo., representative of the new-business department of the Empire District Electric Company, has been made new-business manager of the Ashland (Ohio) Gas & Electric Company.

Jefferson L. Alexander, for many years superintendent of the lighting department of the Savannah (Ga.) Electric Company, has been transferred by the Stone & Webster Management Association to a similar position with the El Paso (Tex.) Electric Company.

R. E. Brown has been appointed commercial manager of the Little Rock (Ark.) Railway & Electric Company to succeed A. E. Smith.

W. R. Sammons, formerly of the commercial department of the Knoxville (Tenn.) Railway & Light Company, has succeeded G. H. Smart as commercial manager.

J. F. Owens, vice-president and general manager of the Oklahoma Gas & Electric Company, who, as announced in the ELECTRICAL WORLD for May 4, was elected president of the Oklahoma Gas, Electric and Street Railway Association, received his education in the University of Kansas and, after teaching for a few years, entered the utility business. He installed and managed the electric plant at Oswego, Kan., and then went to Oklahoma, where he installed the Wagoner plant and managed the property for three years. He then accepted the position of superintendent of the Caney River Gas Company, serving in that capacity for two years. In 1911 he became connected with the Byllesby interests as superintendent of the Muskogee Gas & Electric Company, being promoted in March, 1917, to the position of general manager of the Muskogee property. In March, 1918, he moved to Oklahoma City and was promoted to the position of vice-president and general manager of the consolidated Byllesby properties in Oklahoma.

Obituary

Charles F. Sise, founder of the Northern Electric Company of Canada, died on April 9. In 1879 he went to Canada for the purpose of organizing the telephone business of the Dominion on a national basis. For many years he was president of the Bell Telephone Company of Canada.

E. P. Warner, a pioneer in the field of commercial electrical design, died in Los Angeles recently, at the age of seventy-seven years. Mr. Warner was first engaged in the manufacture of telegraph apparatus. In 1872 he entered the employ of the Western Electric Company, retiring after thirty-eight years of service in 1910. For many years Mr. Warner was associated with the development of power apparatus and arc lights for the company. When he retired he was engaged in sales work.

Major Charles G. Baird, Signal Corps, U. S. A., reported dead from disease in Monday's casualty list from General Pershing, was the chief of the entire telephone and telegraphic service of the American Expeditionary Force in France. He entered the army immediately after Congress declared war on Germany and organized the 413th Telegraph Battalion, one of the first of the Signal Corps units ordered overseas. For a number of years Major Baird has been recognized as one of the leading experts in America on railroad signal equipment. He was thirty-eight years old.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

RESALE PRICE FIXING IS TO BE COMBATED

Recent Decision Establishes the Policy Which Will
Henceforth Be Followed by the Federal
Trade Commission

For a considerable time there has been a controversy throughout the country over the question of the right of manufacturers, wholesalers, etc., to fix resale prices at which their articles must be sold. The right to maintain such resale prices has been contended for by them, and the question whether such right exists has been brought before the Federal Trade Commission numerous times.

The Federal Trade Commission has just disposed of the first of the cases in which complaints have been issued charging violations of law through fixing the resale price of articles, and an order to cease and desist from this practice has been issued by it in the case of Chester, Kent & Company, Inc., of Boston, manufacturers of proprietary medicines.

Attorneys for the company admitted that in the past the practices complained of had been in use. The order, the first in cases of this character, forbids the company to (a) indicate to dealers the prices for which its proprietary or patent medicines shall be resold; (b) obtain agreements from dealers to adhere to such prices; (c) refuse to sell to dealers who fail to adhere to such prices; (d) refuse to sell to dealers who fail to adhere to such prices upon the same terms as dealers who do so adhere; (e) furnish any advantage to dealers who adhere to the resale prices while refusing similar treatment to dealers who do not adhere to the prices.

The Federal Trade Commission has made a statement saying:

"After full consideration the Federal Trade Commission has decided to issue complaints against all business concerns that refuse to sell unless the purchaser will agree to maintain a resale price fixed by the seller. The case just decided is the first formal finding by the commission to that effect. When once an article has passed from the maker to a purchaser he owns it, and the owner of such article may sell it at any price that he chooses provided he does not himself sell it at such price as to be below cost and thereby enter into unfair competition with other retailers selling the same article.

"This decision is going to be open to considerable controversy in relation to the subject matter thereof, and the matter will probably have to be settled by an act of Congress in the manner suggested by Mr. Justice Brandeis in his concurring opinion in the Supreme Court of the United States in the case of the American Graphophone Company. The Stephens bill which is now in Congress is in relation to that matter, but in the estimation of many business men and others it is thought to be broader than it should be. It may be that resale prices can be so regulated by placing somewhere power protecting against unfair prices as to make them work equitably and be a fair method of competition in commerce, but that question will undoubtedly have to be settled by Congressional action."

At almost the same time that this statement was made Judge Hand of the Federal District Court signed an order dissolving a combination alleged to have been created by the Victor Talking Machine Company. The complaint accused the Victor company of having entered into unlawful agreements with upward of 7000 dealers in various parts of the United States for the purpose of preventing competition, to limit the supply and to fix the prices of talking machines and records made by the defendant.

EFFECT OF THE WAR ON LAMP-BULB COMPOSITION

New Glass Has Many Advantages That Make for
Speed in Manufacturing Besides Lowering
the Cost of Production

As a result of the war a decided change in the making of glass bulbs for incandescent lamps has come about during the past year. This change, according to F. A. Poor of the Hygrade Lamp Company, Salem, Mass., will eventually result in the lowering of the cost of finished lamps. The importation of potash was stopped on account of the war, and to-day only a very small percentage of this material is used in lead-glass bulbs. Lime-glass bulbs have come into use as a substitute, the lime-glass bulb being made by automatic machinery instead of being blown by hand. The glass is also melted in large tanks, so that it is sometimes called tank glass, and this tends to reduce the cost of manufacture, since lead-glass bulbs are melted only in pots of small size.

Another advantage of lime glass is its softness and quicker speed of melting as compared with lead glass. In time this is likely to lead to faster production, and the light-green color is pleasing. The shrinkage has gradually been brought down from a maximum of 50 per cent to 15 to 30 per cent, depending upon the extent to which a factory substitutes lime glass for lead glass. The Hygrade company has found progressive improvement in shipments of lime glass. The practice of receiving lime-glass bulbs from the glass factories all cracked off will soon become standard, and this, with experience in handling the newer material, is likely to lead to decreased shrinkage and lower production cost throughout the usual range of commercial sizes.

NORTH AMERICAN GOODS IN SOUTH AMERICAN MARKET

Some Reasons Advanced Why Manufacturers in the
United States Are Not Able to Compete
with European Goods

That South America is a fruitful field for electrical goods is well known. It is equally well known that American goods have not sold in these southern republics as have European goods. An interesting sidelight on the reasons for American goods losing out in the competition for this market is given by Pedro Luis Gonzalez of Santiago, Chile, the editor of the Chilean government publication *Boletín de la Sociedad de Fomento Fabril*, which is probably the leading publication in Latin America devoted to industrial and commercial affairs. He said: "If there is one line of trade where American manufacturers and exporters would profit immensely by a genuine effort to comprehend the South American market, it is electrical specialties and electrical merchandise of all kinds. Latin America is not importing from the United States anything like the quantity of these goods it would do under different conditions, notwithstanding that our requirements are as great as or greater than they were prior to the war. This is simply and solely for the reason that American exporters have not seriously taken in hand the proposition as have the exporters of Great Britain and France, and as Germany formerly did and will do again when the war is over. I mean by that that these European manufacturers and exporters get close to the popular fancy of our people, and not only frequently

undersell the United States but make trading with them a satisfactory proposition all round.

"Then, again, better terms and prompter deliveries are to be considered. For several years past it has been the custom of the larger British and French exporters to keep at central points in South America fairly representative stocks of goods in warehouses, in charge of a manager with one or two salesmen. These stocks are being added to constantly and steadily replenished. The warehouses in no-wise differ in purpose or in scope from the stock rooms of the home factory where the goods are produced. They do not sell to the retailer, but are for the purpose of keeping the wholesaler (or 'distributor,' as we call him) supplied. In some cases these stock rooms are not sole agencies of a single manufacturer, but several manufacturers in non-competing lines of electrical specialties and general electrical equipment conduct them jointly, thus dividing the expense of maintenance.

"Now, contrast this way of doing business with that of the United States. If an order is placed with a United States manufacturer, the merchant must know just where to locate the manufacturer of the goods in the United States, the price and whether they are in stock for immediate shipment, wait twenty-three to thirty days for his order to reach the manufacturer and a like length of time for the shipment to reach him if the goods are shipped on the day the order is received (which frequently they are not), go through a troublesome routine of insurance, tariff and customs details, pay cash, risk loss from bad packing, and take the chance of finding, after all this delay and annoyance, that the goods sent are not in accordance with order."

METAL MARKET SITUATION

Conference with War Industries Board on Future Price of Copper—Rubber-Covered Wire Advances

A conference between the copper producing and refining interests and the War Industries Board was held in Washington, D. C., last week. The purpose was to have the official price for copper increased from 23.50 cents to 25 cents a pound.

There is a marked difference of opinion as to what action will be agreed upon regarding prices after June 1, when the present rate expires by limitation. Wire and cable manufacturers are inclined to believe a higher figure will be named; but there is strong opposition from those who are of the opinion that to change the existing schedule is unnecessary.

No Straits tin is being offered; a lone lot under urgent demand was sold at \$1 a pound. No. 1 Chinese is selling at 95 cents to \$1, and No. 3 at 91 cents, May shipment. A bill was passed by the House of Representatives last week placing tin under the control of the President, and a fixed price will doubtless be named when this bill becomes a law.

Nickel is down ten points and lead is softer. Changes in old metals are comparatively light.

THE WEEK

IN TRADE

A LONG regular or commercial lines trade in the electrical industry at large is not so active. Government requirements seem to absorb the time and attention of prominent jobbing manufacturers, distributors and producers of everything electrical that is used or can be adapted to war purposes.

Freight embargoes still interfere greatly with the delivery of needed stock, and certain staples are reported as in the anticipated shortage stage. Conduit in many sizes continues to be low in supply, especially on the Pacific Coast and in the Northwest. Large industrial enterprises in these sections are absorbing vast quantities of electrical material, for which they are dependent on Eastern factories. The slow deliveries are hampering the trade.

Collections are reported very satisfactory, with credits closely scrutinized.

NEW YORK

Jobbers report business very good. Government orders continue heavy, but in almost every case where they are likely to tax the resources of jobbers on certain items they are distributed among the manufacturers direct by an official representative in every branch of the electrical field. Business of this kind is taken care of efficiently and prompt deliveries follow.

Shipping promises are hampered by embargoes, and certain lines are none too strong. Labor scarcity is a drawback that becomes more menacing and in the judgment of producers must inevitably affect the price of finished goods. Collections are reported to be particularly good in certain lines for April.

FUSES.—Standard inclosed fuses have been reduced 5 per cent. This is owing, it is alleged, to the sharp competition and increasing sale of the renewable fuse.

LAMPS.—In regular sizes manufacturers have about caught up with the demand. Special lamps, of unique design and lighting effects, are being offered the trade. They are making a favorable impression and large sales are prophesied by progressive jobbers.

COLLECTIONS AND CREDITS.—Several jobbers report collections as good and even better than for some time. This is said to be partly due to the prompt manner in which the government is meeting bills. Statements are now rendered net ten days, and cash discounts are suspended, jobbers being satisfied that settlements will be made. Credits are held in a firm grip.

MOTORS.—A Western manufacturer shipping into Eastern territory states that on single and polyphase motors of 25 hp. commercial deliveries are made in from two weeks to a month, sometimes better, depending on priority orders. On larger-size motors and transformers, 150-hp. rating, shipments are made in from twelve to fourteen weeks. Prices remain steady, but strikes at the plant and ever-recurring labor troubles of one kind or another, if continued, will affect the costs situation. Each order is individually treated, and no quotations are made unless authorized by the factory. This applies also to promises.

LAMP CORD.—An Eastern producer states that, since cotton is a speculative material and the cost is fluctuating widely, no one can safely predict what may be the price in the future. Unless the cotton market shall become stabilized an advance should be expected, particularly when the stock on hand and coming through at old prices is exhausted.

INSULATING TAPES.—The market has been advancing steadily for a year or more, four price increases having occurred within twelve months. The last advance of 10 per cent was made a month ago, responsive to the high cost

of cotton cloths and also a higher price for oils and varnishes.

FANS.—With the carefully expressed opinion of several fan manufacturers which appeared in a recent issue of the *ELECTRICAL WORLD*, that a shortage was imminent, in mind, another producer of large facilities qualified the statement from his own point of view. He believed that if there were a shortage it would be in the Eastern States and New England. The West and Southwest are already amply provided, he asserted, and deliveries in many cases have already been accomplished. The only exception in making shipments, east and west bound, was from Philadelphia. Priority orders there seemed to him almost impossible, though no explanation was offered. However, the arrival of warm weather, the crucial test, might put a different complexion on the entire fan situation. A New York jobber is positive a scarcity will ensue, stating that the selling season has already opened, two months in advance of the usual time. A warm summer is anticipated and figured upon by dealers.

PORCELAIN.—Knobs and cleats are in fair supply, but shipments are held up at the principal factories by embargoes. Tubes are short. An advance of 3 to 7 cents apiece has been announced on Hubbell sockets and ceiling receptacles, effective as of May 1. Other manufacturers report that price increases were made on their products previously.

LAMP GUARDS.—An increase of 33 1/3 per cent has been made on Matthews lamp guards.

CHICAGO

Interest in the Liberty loan campaign in Chicago has not slowed up business to any greater extent than was expected. A good many of the men in the industry have been devoting the major portion of their time to the business of selling government bonds, but the trade has learned to expect this activity and to discount it in advance. Government buying of supplies is not as yet very heavy, but is constantly expected to grow. There is also a feeling that central stations will have to loosen up before long on purchases of certain classes. The real estate market here and there is beginning to show activity in the matter of groups of workmen's cottages consisting of from 50 to 100 units. More of this business is to be expected as the war progresses. On the whole, the business continues about the same as to volume. The Sanitary District is in the market for a large bill of pumping equipment.

The building activity for the week ending May 1 amounted to 106 building permits, totaling \$898,100. For last week 111 building permits were issued, totaling \$630,600. For the same week last year 146 building permits were issued, amounting to \$1,176,800. The electrical permits for the week of May 1 this year totaled 657. This included 7411 incandescent lamps and 1318 hp. Last week 671 permits were issued for 8362 incandescent lamps and 772 hp. For the same week last year 944 permits were issued.

COPPER WIRE.—Weatherproof wire has advanced to a 30-cent base. The increase of 2 cents was due to the rising price of cotton. Weatherproof is steady at this price.

CONDUIT.—The difficulty in getting the larger sizes still prevails.

PORCELAIN.—There is very little activity. Opinion in some quarters has it that something is about to happen in the porcelain market.

FANS.—Dealers outside of Chicago appear to be taking the jobbers' word for it that there will be a fan shortage this year, and a great many of the jobbers have their distributors signed up. In Chicago it appears that the retailers have a pretty fair stock left over from last season and are not so ready to take on new commitments as usual at this time.

INCANDESCENT LAMPS.—In the standard sizes the jobbers are pretty well caught up on stock. On the larger sizes and on the 220-volt lamps, however, shortages still exist.

BOSTON

Sales are holding up well this week, and the successful completion of the Liberty loan campaign is marked by good feeling in commercial circles. Collections are reasonably good, though credits are closely scrutinized in connection with new business. In most lines deliveries show some improvement, owing to better railroad conditions. Stocks are generally in excellent shape to meet present demands, with the exception of motors above 50 hp. in rating and the larger sizes of conduit. Appliances are moving well, and the market is oversold on one of the best makes of washing machines. Prices held steady throughout the week, with a tendency toward softness in the smaller sizes of copper wire on close competitive bidding, due to the lower price of cotton. The shortage of skilled labor is quite serious.

LAMPS.—Stocks are increasing locally in all except miniature sizes, which are in great demand for military and naval uses as well as for automobile and motorcycle service. Prices show no change. The factories are working hard to catch up with back orders, and considerable shipments have been added to local storage on the ordinary mercantile and commercial sizes. Orders keep up exceptionally well.

AUTOMOBILE BATTERIES AND STARTERS.—A boom is noted in these equipments with the rapid advance of the automobile season. Rebuilt cars are calling for much accessory apparatus of improved design, and it is hard to fill the current demands from local stocks; but it is being done, on the whole, very well. Prices continue steady.

SIGNALING SYSTEMS.—The low volume of new construction in building work has cut down the sales of telephone, signaling and annunciator systems materially to commercial buyers, and even the war-order plants are not installing interior telephone apparatus to a degree which offsets the lack of a normal market. Manufacturers of this type of equipment, however, are busy on special government orders. A shortage of skilled machinists is reported.

MOTORS.—Deliveries less than five months are still difficult to procure on motors of 50 hp. and upward, speaking generally. Stocks are increasing, on the whole, in the smaller motors, both alternating-current and direct-current. The demand seems to be decreasing slowly in the lower sizes, with prices still unchanged but subject to possible shading on resales if the present recession in small-motor consumption is long maintained.

STORAGE BATTERIES.—Distributors report continued heavy demands from the government and the automobile industry. The former dominates the factory output to-day, and labor shortage is seriously felt by the manufacturers. Deliveries cannot be made over the railroads fast enough to enable any sizable stocks to be accumulated. Prices hold firm, with little prospect of further advance in the near future.

CONDUIT.—Stocks are spotty in range and total deliveries are very unsatisfactory, and government control of basic materials tends to shut out the ordinary consumer from getting even reasonably fair shipments. The first claim on conduit is held by the Emergency Fleet Corporation, the government's general war work holding the second.

PORCELAIN.—While it is difficult to build up local stocks, the manufacturers are gradually catching up on orders, and the situation is a little better than a few weeks ago. House-wiring business is at such a low ebb that other requirements can be filled more easily than were a vigorous policy of central-station business expansion under way. No immediate changes in price are anticipated.

WIRE AND CABLE.—Government orders almost monopolize the market, including among these all war-service work. Prices are firm, but in some cases it is understood that slight recessions of the order of 1/4 cent per pound are quoted on small weatherproof wire with a relatively high cotton content in proportion to the metal constituent. No change in base prices has been noted as a result of the slump in cotton.

ATLANTA

Not all of the gains in business, where they appear, are in number and magnitude of transactions, and the distinction between volumes and values becomes more sharply defined as the rise in price along general lines continues. The steadily enhancing costs, together with financial difficulties, have a perceptible influence in repressing demands in not a few quarters. With the advancing season there has come an appreciable revival of activities in many directions, although the cold weather has militated against the best results in retail distribution. Residence and apartment construction in Atlanta and vicinity during the last two months shows up better than in the corresponding months of last year in face of less propitious general building conditions. A number of industrial concerns have been organized in the South the past week. The Lake Charles Naval Stores Company, Lake Charles, La., capitalized at \$900,000, has taken over some valuable turpentine land in Louisiana. The Aluminum Company of America will erect a nitrate plant at Maryville, Tenn., costing approximately \$2,000,000. Power will be transmitted from the new Alcoa plant on the Little Tennessee River, about 45 miles south of Knoxville. Specifications call for completion of this plant by Sept. 1.

In small lighting plants the outlook is much brighter this week for plants from 50 kva. to 250 kva. While most of the inquiries noted are coming from municipalities, a sprinkling of private demand is observed. Manufacturers report increasing sales of late, running anywhere from \$5,000 to \$50,000. This business is being handled by local bankers. Prices on this class of equipment are up approximately 20 per cent over last year. Shipments are being made from five to six months.

POLE AND LINE MATERIAL.—Jobbers report substantial sales to the smaller municipal plants covering cross-arms, pins and the general list of material under this head. This material is being used mostly for replacement work. Turnbuckles have advanced 20 per cent. Deliveries on the whole are still poor on line material.

FLASHLAMPS.—The volume of sales as reported by dealers indicates an increasing demand. Stocks are in good condition.

DRY BATTERIES.—With the advent of more seasonable weather this week a decline in sales is noted. Local stocks have accumulated during the last few weeks. Jobbers' outstanding shipments are coming in more rapidly.

SCHEDULE MATERIAL.—A heavy business is reported from all quarters, with sporadic and spotty pressures from government sources for large quantities. As a rule stocks are in fair shape and well distributed.

CONDUIT.—An excellent market exists, with a corresponding low stock condition, some sizes being entirely out. A rumor is afloat that conduit is going to take a jump shortly.

RUBBER-COVERED WIRE.—The rumor regarding an increase for conduit holds good as well for wire. It has been stated from reliable sources that No. 14 single-braid is going to be very scarce and exceedingly hard to get two or three months from now.

SEATTLE

The volume of business transacted during the past week by Northwest electrical jobbers was exceedingly satisfactory and was equal to that of the past several weeks. No exceptionally large orders were placed. The bulk was with the shipyards, particularly steel yards in Seattle and Portland territories. Several districts report increased buying from wooden shipyards which recently secured additional contracts. The largest steel shipyard in Tacoma in operation plans enlarging the yard by seven ways.

The close of the third Liberty loan drive brought a reaction in retail business, particular animation being shown in increased activity and volume in this trade. The conduit market condition remains the same. Stocks are very low and the larger sizes are extremely hard to obtain. The apparent reason for shortages in wire, motors and certain types of lamps lies in uncertain shipments from

Eastern factories. L. C. L. shipments are next to impossible to obtain. Several of the largest Seattle jobbers report the early arrival of shipments en route for the last sixty days. A Seattle car-building concern received an order for 14,000 box cars to be built for the government. It is assumed by West Coast lumbermen that fir will enter largely into the construction of this new rolling stock along the line of government plans to conserve steel. The effect of placing this order in the Northwest, calling for delivery at the earliest date, will be to strengthen the entire lumber market. Since the first of the year more than \$3,500,000 has been invested in new buildings. In Seattle the large bulk of the building consists of bungalows and frame residences. Selling activity in the residence districts continues unabated. During the week one Seattle realty firm alone took out permits for the immediate erection of thirty-three homes in Tacoma. During April the number of building permits and the cash value represented were twice as large as for the same month last year.

Credits and collections are keeping pace with sales. Both were very satisfactory during April. The third Liberty loan drive among the jobbers had little if any effect on business, the comparison between business transacted in March and in April showing small difference. Both were heavy months, April perhaps being a shade heavier. Very few new credits are being placed, business transacted being merely an extension of credit to old-established customers, which is considered preferable to placing new business with new concerns whose business integrity has not been tested. Inquiries for credit from shipbuilding concerns awaiting sanction from the government before starting operations are coming in. Credits are being more closely scrutinized.

SAN FRANCISCO

During the past week there have been a number of inquiries for ship-wiring material, particularly for electrical hardware, such as bells, push-buttons and annunciators. These have been the outstanding features of a rather dull week. Among the building permits announced are those for a six-story building for the San Francisco Federal Reserve bank and announcement of the construction of an industrial city at Clyde, near Bay Point. The city of San Francisco is calling for bids for the construction of a new pier. The Bethlehem Steel Works announces a two-million-dollar plant at Hunters Point, on San Francisco Bay, and the United States Army will construct a four-hundred-thousand-dollar balloon camp near Arcadia. Canneries and suitable industrial housing still remain the principal building items. A number of churches are also under construction, and there is also some reconstruction for the southern California area shaken by earthquakes.

CONTROL DEVICES.—There is a large call for control devices for heavy motors and for industrial systems, especially for shipyards and ship control.

SWITCHES.—An unusual demand exists for big switches. The number of smaller knife switches sold is low because of the lack of house-wiring jobs and because power companies are not selling as many ranges as they did last year. Still the fact that the State of California is now employing inspectors to see that its safety laws are enforced will cause an ever-increasing demand, even though a large portion of prudent manufacturers have already complied with this law. Eastern shipments are fair and local stocks good.

ELECTRICAL INSTRUMENTS.—The demand for electrical measuring recording instruments, particularly for styles and sizes previously regarded as unusual, is so great that the Eastern factories cannot cope with it. Three to six months' delivery is the rule.

LAMP CORD.—For lamp cord, reinforced cord and other house-wiring styles there is little regular demand, but the shipbuilding industries are requiring vast quantities of deck cable, orders for 10,000 ft. or 25,000 ft. of a size being now regarded as quite regular. The underwriters' recommendation that "Mazda C" lamps of certain capacities be wired with asbestos insulated lamp cord has not been thoroughly enforced and is not causing the expected demand.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Improved Electric Curling Iron

Landers, Frary & Clark, New Britain, Conn., have made an improvement on their type of combination curling iron and hair drier that was described in the ELECTRICAL WORLD for

IMPROVED CURLING IRON FITS IN HANDBAG

Oct. 24, 1914. The handle receptacle is recessed, thus permitting the cord connector to enter the receptacle and make it more rigid. The curler rod of the latest type is an inch shorter than the old model, and the entire length of the appliance is reduced nearly 2 in. (5 cm.) and therefore allows the user to carry it more easily in a handbag. The heating unit consists of resistance wire flat-wound on a mica core and clamped between steel plates which have thermol contact with the curling tube through brass springs.

Regulator for Mazda Lamps

In order to use Mazda lamps for motion-picture projection the Argus Lamp & Appliance Company, 322 Euclid Avenue, Cleveland, Ohio, has developed the Sheck universal adapter for quickly adapting any carbon-arc motion-picture projecting machines and also a regulator for holding the voltage and current supply to the lamp at a constant value. If the voltage supplied to the lamp is too high, the life of the

REGULATOR INSURES ACCURACY BUT
REQUIRES LITTLE ATTENTION

lamp will be very short. To produce efficient results the current must be kept at the constant rated value of the lamp. A small reactance is used in the primary circuit to take care of all conditions of variations of line voltage.

An ammeter is placed in the secondary so that the Mazda projector light can be held in the constant current, thus insuring a steady, brilliant picture. The accompanying illustration shows the two-piece regulating rheostat—the constant resistance to be mounted outside the booth and the small regulative resistance to be mounted in an accessible position for the operator.

Complete Battery-Charging Outfit

A complete 150-volt motor-generator set and switchboard for charging storage batteries is being manufactured by the Emerson Electric Manufacturing Company, 2024 Washington Boulevard,

BATTERY-CHARGING OUTFIT CONTROLLED
FROM SWITCHBOARD BY PUSH-BUTTONS

St. Louis, Mo. The outfit is designed to charge two 6-volt batteries in series or one 12-volt battery. The switchboard is equipped with a rheostat for varying the charging rate, an ammeter for indicating the direction and amount of current flowing and a fuse block and cartridge fuses for protecting the motor. Push switches for starting the motor and for connecting the generator to the battery are also installed on the switchboard. The motor operates on a 110-volt, 60-cycle single-phase alternating-current energy supply.

One-Line Clamshell Buckets

A combined clamshell bucket and carriage for use on overhead cables which requires only one hoisting rope, one single-drum engine or motor and one operator is being manufactured by the Blaw-Knox Company of Pittsburgh, Pa. The outfit is especially adapted for unloading and transferring materials

from cars, barges or storage piles, and for removing coal from open cars.

A stop is attached to the supporting cable at the point where it is desired to lower the bucket. This stop may be shifted along the cable as required or it may remain fixed. When the bucket is being hoisted or lowered, the lower end of the carriage is automatically locked to this stop. When, however, the bucket is hoisted to the carriage, the pull of the carriage against the stop automatically locks the bucket to the carriage and at the same time releases the carriage from the stop and allows it to move upward along the supporting cable until it comes to a stop where it is again desired to lower the bucket. Upon reaching the upper stop a latch attached to the carriage engages the stop in such a manner that the slacking on the hoisting rope releases the bucket from the carriage. The bucket may be dumped at any point along the line or after being lowered at either end of the line. Renewed pull on the line raises the bucket to the carriage and locks it there. At the same time it raises the latch, permitting the carriage to move away from the stop.

High-Set Furnace Arch

The Green Engineering Company, East Chicago, Ind., has developed a type of boiler furnace arch called the "Sealflex," that is shown herewith. These arches are set higher and are pitched more steeply than ordinary arches and therefore allow more combustion space. The large angle of the arch reflects the heat from the rear portion of the fuel bed up to the grate and gives an intense and rapid ignition of the fuel. The manufacturer claims that from a practical standpoint it is impossible to maintain an air-tight joint between the gate and the end of

COLD AIR HEATED BY MEANS OF PROJECT-
ING TILE

the arch under ordinary conditions because there is always a crack at this point through which cold air enters the furnace. Cold air also enters through the hopper between the gate and the coal. Usually this cold air retards

ignition when it comes in contact with the front portion of the arch. In this installation, however, the specially shaped tile projecting downward directly behind the stoker gate is grouted in place with the tile immediately behind it, thus forming a seal. All cold air entering the furnace at the stoker front must pass under this tile. It is heated so effectively by the tile before it can come in contact with the surface of the arch proper that the ignition is not affected. The arch proper is therefore not chilled and quickly reflects the rays of heat from the rear to the front of the stoker, where it is most needed for ignition. The single row of projecting tile and the front of the arch proper are set approximately 2 ft. (60 cm.) above the grate surface. The manufacturer claims that this arch gives increased ignition and more complete combustion, even with very low-grade fuel.

Combination Switch and Receptacle Plate

An outlet plate that is provided with a switch is being marketed by the Peerless Light Company, Halsted and Adams Streets, Chicago. The plate is made from heavy-gage brass finished to match any wood desired. It is advantageous for use in rooms that are without the necessary outlets because it saves the cost of extensive wiring.

Speed Reduction Gear That Requires Small Space

A mechanical drive for steam-plant auxiliaries and electric motor-driven units that allows driver and driven units to be lined up has been developed by the Poole Engineering & Machine Company of Woodberry, Baltimore, Md. The device requires small space for installation, and also saves considerable room in the power plant by allowing the two machines to be placed close together. The illustration shows the principle of operation, which consists of an internal gear attached directly to the slow-moving unit and a

"SPEED TRANSFORMER" ELIMINATES CHAINS AND BELTS

small pinion in the center directly connected to the internal gear by three planet gear idlers. The planet gears are held in a stationary position, but are free to turn around on their own axes. When the internal gear rotates it moves

the planet gears and thereby rotates the pinion. This action can be reversed—that is, the pinion can be driven to operate the planet gear and reduce the speed.

Steel-Inclosed Safety Switch

A safety switch with quick-break mechanism that is positive and insures simultaneous break at all blades is being manufactured by the Square D Company, Detroit. This line of steel-inclosed switches, which have been described in the ELECTRICAL WORLD at various times, are of simple construction and are completely inclosed in a sheet-steel box so designed that ample wiring space is provided inside to make the necessary connections. The box is provided with a hinged cover that is held closed by a spring, and the switch is operated by a crank handle on the outside. Raised letters on the box indicate the "on" and "off" positions of the switch.

The switch may be locked in the "off" position to prevent accidents while repairs are being made on apparatus controlled by it, provision being made for three individual padlocks. This padlock

SWITCH OPERATED FROM OUTSIDE BY MEANS OF CRANK

feature is advantageous when there is more than one man working on the line or equipment. When each man starts to work he locks the switch in the "off" position. This eliminates the possibility of either man throwing the switch "on" before all have finished working.

Aluminum Case Vacuum Cleaner

A nozzle which can be easily adjusted to clean thoroughly a carpet of any thickness is one of the features of a cleaner manufactured by the Innovation Electric Company, Inc., 585 Hudson Street, New York City.

The machine has an adjustable handle with rigid pistol grip made of polished hard wood. The handle automatically stands upright and can be arranged to hold the machine in any position for cleaning stairs. A push-button electric switch is attached to the handle in a convenient and accessible position. A tufted bristle brush is held in the nozzle by a rigid frame which

can be swung into a convenient position for cleaning without removing any screws or belts. The device is equipped with a General Electric motor mounted horizontally.

Electric - Driven Sensitive Bench Drill Press

A bench drill press for boring all holes of size up to 3/16 in. (0.47 cm.) driven by a vertical 0.1-hp. Robbins & Myers motor is shown in the accompanying illustration. The drill is only

DRILL PRESS THAT OCCUPIES SMALL SPACE

24 in. (60 cm.) in height, and has a base that is 7.5 in. by 18 in. (19 cm. by 45.7 cm.). A quick adjustable table is provided which has a working surface of 5.5 in. by 5 in. (14 cm. by 12.7 cm.), and will take work up to 4.9 in. (11.1 cm.) in height. The standard spindle speeds are 2100 to 6000 r.p.m., but special pulleys can be furnished if desired to give a main spindle speed of 10,000 r.p.m. The drill press is manufactured by the High Speed Hammer Company, Inc., of Rochester, N. Y.

Socket-Attachment Bell Transformer

A bell transformer provided with a plug to fit the ordinary lamp base is being marketed by B. F. Miller, 201 South Clinton Avenue, Trenton, N. J. The "Liberty Bell" transformer permits easy installation and eliminates the necessity of the soldering of any

SECONDARY MAY BE SHORT-CIRCUITED WITHOUT HARM

connections, as it is provided with secondary binding-post terminals. The manufacturers claim that the transformer will not be harmed if secondary terminals are accidentally short-circuited.

Trade Notes

THE ANDERSON ELECTRIC SPECIALTY COMPANY of Chicago moved its offices from 361 West Van Buren Street to 118 South Clinton Street on May 1.

THE WARD-LEONARD ELECTRIC COMPANY of Mount Vernon, N. Y., has placed a stock of its field rheostats, controllers and resistance units in San Francisco, Cal.

FRED D. WILLIAMS, connected with the H. W. Johns-Manville Company, Philadelphia, at head of the power specialties department, has resigned and will be associated with the L. H. Gilmer Company, Tacoma, Pa., as assistant general manager.

J. M. RIORDAN, until recently sales engineer of the Grant Lees Gear Company of Cleveland, Ohio, and formerly representing the Fellows Gear Shaper Company of Springfield, Vt., in the Central States, is now connected with the sales organization of the Cleveland Milling Machine Company at Cleveland.

THE WALKER VEHICLE COMPANY of Chicago, on April 23 entertained the local electrical men who are interested in the electric vehicle business and who are members of the Chicago electric vehicle section of the National Electric Light Association. Following luncheon the members were conducted through the Walker factory.

THE SORGELE ELECTRIC COMPANY of Milwaukee, Wis., has just completed extensions and improvements, having taken two extra floors on its premises at 138 West Water Street. This space is used for enlarging the repair shop and for motor stock room. Additional machinery was installed and the facilities for handling heavy machinery were improved.

THE GENERAL DEVICES AND FITTINGS COMPANY of Chicago, manufacturer of electrical products, has moved its executive and sales offices and engineering department from the factory, at 817-25 West Washington Boulevard, to the Mid-City Bank Building. It occupies the sixth floor of the building and by the move has secured greatly increased office facilities and drafting-room space.

THE BOSCH MAGNETO COMPANY of Springfield, Mass., and Plainfield, N. J., recently taken over for the government by A. Mitchell Palmer, custodian of alien property, was reorganized May 1. The new officers are: President, Joseph A. Bower of New York City; vice-president, Christian G. Cleveland; treasurer, George A. McDonald, Springfield, Mass.; secretary, William G. Fitzpatrick, Detroit; general manager, A. T. Murray, Allentown, Pa.; assistant treasurer, A. D. Altree, New York City. Domestic business will be carried on as formerly, it is announced.

THE WORTHINGTON PUMP & MACHINE CORPORATION, 115 Broadway, New York City, is now operating eight plants in the United States, as follows: The Worthington Works at Harrison, N. J., devoted exclusively to the manufacture of pumping machinery; the Blake & Knowles Works at East Cambridge, Mass., now entirely rebuilt and producing principally marine pumps; the Deane Works at Holyoke, Mass., which manufactures power pumps only; the Snow-Holly Works at Buffalo, N. Y., building the largest machines required in waterworks, blowing and gas-power engines and oil engines; the Power and Mining Machinery Works at Cudahy, Wis., which makes a complete line of crushing, concentrating and mining equipment; the Laidlaw Works at Cincinnati, Ohio, given over to air-compressing machinery only; the Jeaneville Works at Hazleton, Pa., working at present on a special product, and the International Gas Engine Works, at Cudahy, Wis., making a full line of gas and oil engines and accessories.

THE DEPARTMENT OF COMMERCE, Bureau of Foreign and Domestic Commerce, of Washington, D. C., according to a report published recently, says that American electrical goods have been in much greater demand in Australia since the war started than ever before. At present Australians do not have the same desire to adopt the semi-luxuries in electrical appliances that Americans of sufficient means will not do without. General conditions and methods of conducting business in Australia are described by the writer of the report, Commercial Agent R. A. Lundquist, who, however, devotes most of his space to detailed descriptions of the markets for particular lines of electrical goods, such as power-generating equipment, electric railway equipment, lamps and domestic appliances. The report is entitled "Electrical

Goods in Australia," Special Agents Series No. 145, and is sold for 15 cents by the superintendent of documents, Government Printing Office, Washington, D. C., and by all the district and co-operative offices of the Bureau of Foreign and Domestic Commerce.

Trade Publications

BALL BEARINGS.—Blotters advertising ball bearings have been issued by the Fair Bearing Company of New Britain, Conn.

ELEVATORS.—The Warner Elevator Manufacturing Company is distributing bulletins Nos. 3200, 3100 and 2850, describing its elevators.

BUCKETS.—Single-line clamshell buckets are described in an illustrated booklet recently issued by the Blaw-Knox Company of Pittsburgh, Pa.

FITTINGS.—"Conduit Fittings and Electrical Specialties" is the title of catalog No. 26 issued by Thomas & Betts Company, 63 Vesey Street, New York City.

LIGHTING FIXTURES.—The Daylite Fixture Company, 416 South Dearborn Street, Chicago, has issued a bulletin describing the Bel-Ko-Lite lighting fixture.

WIRE ANCHORS.—The Matthews "Sculix" guy-wire anchors are described in a circular post card being distributed by W. N. Matthews & Brother, Inc., of St. Louis, Mo.

RHEOSTATS.—The Ward-Leonard Electric Company, Mount Vernon, N. Y., has issued bulletin No. 50, entitled "Method of Determining the Size of Battery Charging Rheostat."

TRUCKS.—"Truck Talk" No. 22 is being distributed by the General Motors Truck Company of Pontiac, Mich. This number illustrates some installations and uses of the trucks.

FARM LIGHTING SYSTEMS.—The Domestic Engineering Company, Dayton, Ohio, has issued a circular reproducing advertisements to be published soon in the various popular magazines.

GAS-FILLED LAMPS.—The Whitelite Electric Company, 368 Broome Street, New York City, is distributing several booklets and blotters describing its gas-filled lamps for industrial and domestic uses.

FARM LIGHTING SYSTEMS.—The Electromatic System Company, 2136 Michigan Avenue, Chicago, is distributing circulars describing its farm lighting systems, which do not require a storage battery.

BRACKETS.—Bulletin No. 602 is being distributed by the National Metal Molding Company, Pittsburgh, Pa., showing its "National" brackets, which are complete with insulators and do not necessitate the use of tie wires.

LIGHTING FIXTURES.—The Beardslee Chandler Manufacturing Company, 216 South Jefferson Street, Chicago, has issued a folder describing and illustrating the Denzar lighting fixture for both ceiling and pendant-type installations.

ELECTRIC BARBER SUPPLIES.—The Racine Universal Motor Company, 53 West Jackson Boulevard, Chicago, has issued a folder showing its Moore electric hair cutter and vibrator and hair-drying attachment for the hair-cutter machine.

LIGHTING AND AUTOMOBILE SPECIALTIES.—The Anderson Electric Specialty Company, 118 South Clinton Street, Chicago, has issued a booklet describing and illustrating a line of small lighting specialties and electric automobile supplies.

MOTION-PICTURE TRANSFORMERS.—The Lea-Bel Company, 610 Schiller Building, Chicago, is distributing a circular describing the Lea-Bel transformer and current regulator to be used with Mazda gas-filled lamps for motion-picture projection.

ELECTRICAL APPARATUS.—The General Electric Company of Schenectady, N. Y., has issued a bulletin describing its pressure governor for alternating-current or direct-current circuits, No. CR 2922, and its bulletin No. 57,419, illustrating parts of type FP-10 oil circuit breakers.

DRINKING - WATER SYSTEM.—The Armstrong Cork & Insulation Company, Pittsburgh, Pa., has issued a circular entitled "Satisfaction or—" which discusses the subject of industrial drinking-water systems. Copies of the folder will be supplied by this company upon request.

WIRE.—The Driver-Harris Company, Harrison, N. J., has recently issued a circular describing its wire baskets for dipping purposes. These baskets are made of nichrome wire. The company is also distributing a folder describing pure sheet nickel for manufacturing purposes.

New Incorporations

THE ALABAMA PUBLIC SERVICE COMPANY of Jasper, Ala., has been incorporated with a capital stock of \$3,000 by P. L. Fuller, E. T. Rice and N. H. Prickett.

THE NIXON (TEX.) ELECTRIC LIGHT & POWER COMPANY has been incorporated by J. F. Wood, Jr., W. L. Hoover and C. T. Morene. The company is capitalized at \$3,000.

THE SOUTHERN CITIES POWER COMPANY of Chattanooga, Tenn., has been incorporated by George B. Adams, J. C. Stickney, G. W. Erwin, J. H. Ramyer and John R. Evans. The company is capitalized at \$50,000.

THE TWIN DRY CELL BATTERY COMPANY of Cleveland, Ohio, has been incorporated by H. R. Palmer, A. C. Brainard, Robb O. Bartholomew, Ralph L. Bailey and John P. Nally. The company is capitalized at \$25,000.

THE WINNEBAGO ELECTRIC COMPANY of Winneconne, Wis., has been incorporated with a capital stock of \$5,000 to supply electricity for lamps and motors in Winneconne. The incorporators are: Richard W. Button and A. Q. Button.

THE BRITISH-AMERICAN PRODUCTS, Inc., has filed articles of incorporation with a capital stock of \$500,000 to do a general electrical, mechanical and constructing engineering business. The incorporators are: A. W. Britton, S. B. Howard and Paul S. Smith of New York, N. Y.

THE C. E. STAPP ELECTRIC COMPANY of Peoria, Ill., has been chartered with a capital stock of \$20,000 for the purpose of doing a general electrical contracting business and dealing in electrical supplies. The incorporators are: C. E. Stapp, C. F. Theobald and E. T. Cunningham.

THE SOUTH NEW CASTLE ELECTRIC COMPANY of New Castle, Pa., has been granted a charter with a capital stock of \$5,000 to supply electricity for lamps and motors in this borough. The directors are: J. C. Chesnut and L. B. Round of New Castle and A. E. Dedricks of Youngstown, Ohio.

THE CONLAN ELECTRIC CORPORATION of New York, N. Y., has been incorporated by David Conlan, Jr., Robert S. Conlan of the Bronx and Frank A. Butler of Ridgewood, N. J. The company is capitalized at \$10,000 and proposes to do a general electric contracting and manufacturing business.

THE DEXTER & ADAMS MACHINE COMPANY of New York, N. Y., has been incorporated by R. H. Garretton, G. Rosendale and S. C. Whitebeck, 52 Broadway, New York City. The company is capitalized at \$50,000 and proposes to manufacture machinery and appliances and to do a general electrical and mechanical engineering business.

COMPANIA DE SERVICIO PUBLICO DE SANTA MARTA has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$100,000 to construct and operate telephone, telegraph and electric light, heat and power systems. The incorporators are: Ferris Gles, E. M. Haslam and E. Lemon of Wilmington, Del.

THE INTERNATIONAL WESTERN ELECTRIC COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$20,000,000. The company proposes to manufacture all kinds of electrical instruments and machinery and to engage entirely in foreign trade. The incorporators are: William O'Keefe, E. E. Aberle and J. H. Dowdell of Wilmington, Del.

THE CENTRAL ELECTRIC DEVELOPMENT & HOLDING COMPANY of Humboldt, Iowa, has been organized for the purpose of building farmers' co-operative electric light and power systems, the cost of the individual systems to vary from \$600 to \$1,000. The officers of the company are: I. C. Elston, Jr., of Chicago, Ill., president; W. J. Brownell of Sioux City, vice-president; D. M. Sterns, secretary and general manager, and L. Winne, treasurer.

THE EMPIRE POWER CORPORATION of Niagara Falls, N. Y., has been granted a charter by the Secretary of State. The company is capitalized at \$3,000,000 and proposes to build a power plant at the head of the falls. The power house, intake tunnel and all buildings are to be built underground. The incorporators are: Frank B. Baird, 1069 Delaware Avenue; Edward L. Koons, 1131 Delaware Avenue, and Myron S. Hall, 184 Bidwell Parkway, Buffalo, N. Y.

New England States

EASTPORT, ME.—The Eastport Electric Company, recently organized with a capital stock of \$25,000, is installing a new plant in Eastport. S. D. Leavitt is president.

MANCHESTER, N. H.—A permit has been granted the Manchester Traction, Light & Power Company to erect a boiler house near Mast Street.

BELLOWS FALLS, VT.—The substation of the Rockingham plant of the Fall Mountain Electric Company was recently damaged by fire. Switchboards, transformers and high-tension wires were destroyed, causing a loss of about \$10,000.

ENOSBURG, VT.—The Butterfield Electric Company, recently incorporated with a capital stock of \$150,000, proposes to develop hydroelectric power on the Missisquoi River in the towns of Montgomery, Berkshire and Enosburg. The incorporators are: C. E. Nelson, B. F. Butterfield of Derby Line; Ralph Buck and C. T. Hall of Montgomery.

SPRINGFIELD, VT.—The Colonial Power & Light Company has secured a contract for supplying secondary power to the amount of 100 kw. to the woolen mill at Proctorsville. Plans are now being prepared for the erection of a new 11,000-volt transmission line to the mill.

BOSTON, MASS.—Bids will be received by the Commission on Waterways and Public Lands, Room 473, State House, Boston, Mass., until May 27 for the erection of a brick building, about 109 ft. by 41 ft., for pump house at the dry dock at South Boston, including rooms for offices and transformers, on concrete foundations. Frank W. Hodgdon is engineer.

BROCKTON, MASS.—Andrew L. Hunter, president of the Common Council, has asked that an investigation be made at once of the electric plant in the city hall to see if it cannot be repaired and utilized to supply electricity to light that building.

CAMBRIDGE, MASS.—Work has begun on the construction of an engine building, 43 ft. by 190 ft., one story, at the Massachusetts Institute of Technology at Cambridge.

BRIDGEPORT, CONN.—Contract has been awarded by the United Illuminating Company to the New England Iron Works, 94 Commerce Street, New Haven, for alterations and improvements to its local power house.

DANIELSON, CONN.—Preparations, it is reported, are being made for the erection of a power house at the Goodyear Cotton Mills. The cost of the proposed plant is estimated at \$150,000 and the equipment will include steam turbine engines. The company is controlled by the Goodyear Tire & Rubber Company of Akron, Ohio.

NEW HAVEN, CONN.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until May 21 for furnishing and installing interior lighting fixtures in the United States post office at New Haven. Copies of plans and specifications may be obtained at the above office.

NEW HAVEN, CONN.—Upward of 2000 acres of land have been secured by the Connecticut Light & Power Company in the towns of New Fairfield and Sherman for a site for its proposed new storage reservoir, to be used as an auxiliary to the dam now under construction at Zoar Bridge. No power house is contemplated in connection with the second dam.

NORWICH, CONN.—The City Gas and Electric Department has awarded the contract for construction of the foundations for the two new boilers, turbine, two 12,000-gal. oil drums and small brick building for blowers to C. M. Williams.

WESTPORT, CONN.—A. S. Green of Westport has been awarded the contract to install a number of Western Electric searchlights at the government works at Fields Point, R. I.

Middle Atlantic States

BROOKLYN, N. Y.—The Clark Electric & Manufacturing Company, 149 Broadway, New York, has purchased a factory building at 22 Vanderbilt Avenue, near Flushing Avenue. The company manufactures electrical goods.

BROOKLYN, N. Y.—Bids will be received by the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 13, extension of date from May 6, under specification 2913 for installing an electrically-operated traveling crane in the structural shop at New York, to cost about \$8,500.

BROOKLYN, N. Y.—Bids will be received by C. B. J. Snyder, superintendent of

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

school buildings, Municipal Building, New York, until May 13 for electrical work at the Boys' Vocational School, Cary Building, Jay and Nassau Streets. Also for alterations, repairs, electric work, heating, etc., at Public School 153, Belmont Avenue, Ashford and Warwick Streets, borough of Brooklyn. A separate bid to be submitted on each item.

BUFFALO, N. Y.—Contracts will soon be awarded by the War Department, Cantonment Division, Washington, D. C., for the construction of buildings for an aero testing field at Buffalo, to cost about \$425,000.

BUFFALO, N. Y.—Contract has been awarded by the Kellogg Products Company, 98 Delaware Avenue, for the construction of a new pumping plant at 1317 Elk Street to B. I. Crooker, Builders' Exchange, Buffalo.

BUFFALO, N. Y.—Contract has been awarded by the Delaware, Lackawanna & Western Railroad Company for the construction of a power house at East Buffalo to John W. Cowper, Fidelity Building, Buffalo.

CHATEAUGAY, N. Y.—The Chasm Power Company has petitioned the Public Service Commission for permission to issue \$25,000 in bonds, the proceeds to be used to pay the expense of building an auxiliary power house and equipping same to be used in case of emergencies, the cost of which is estimated at \$23,500.

NEWFANE, N. Y.—Owing to an increase in rates from \$14 to \$21 each per year for street lamps the residents of the village of Newfane have voted to discontinue the street-lighting service. The contract with the Lockport Felt Company, which controls the electric plant in Newfane, will expire soon.

NEW YORK, N. Y.—The capital stock of the Novo Manufacturing Company, 4234 West Thirty-third Street, manufacturer of electrical goods, has been increased from \$100,000 to \$150,000.

NEW YORK, N. Y.—The capital stock of the E. J. Electric Installation Company, 221 West Thirty-third Street, has been increased from \$10,000 to \$50,000, the proceeds to be used for expansion purposes.

NEW YORK, N. Y.—Plans have been filed by the B. E. Davis Company, 250 Hudson Street, for the construction of a new eight-story battery building, to be located on Hudson Street, between Broome and Dominick Streets. Contract has been awarded to the Pershing Construction Company, 309 Broadway, New York City.

NEW YORK, N. Y.—Bids will be received by C. E. J. Snyder, superintendent of school buildings, Department of Education, Municipal Building, New York, until May 13 for electric work at Public School 43, 129th Street and Amsterdam Avenue. Also for bids for installing electric equipment in addition to and alterations in Public School 32 on East 183d Street, between Cambreling and Beaumont Avenues. Separate bids to be submitted on each item.

NIAGARA FALLS, N. Y.—Plans have been filed by the Star Electrode Works of the National Carbon Company for the construction of a new mixing and milling building. Braas Brothers, 110 Whitney Avenue, Niagara Falls, are contractors.

OGDENSBURG, N. Y.—Plans are being prepared by the New Jersey Zinc Company, 55 Wall Street, New York City, for rebuilding its local power house, recently destroyed by fire. The cost of the proposed plant is estimated at \$15,000.

POTSDAM, N. Y.—Work has been resumed by the St. Lawrence Transmission Company on the construction of its dam across the Raquette River at Colton, and at Bross Bridge, where it is erecting a power house for the development of the water power. Machinery, it is understood, has been purchased.

SYRACUSE, N. Y.—The Public Service Commission has granted the Syracuse Lighting Company permission to extend its electric transmission lines to Geddes to furnish electricity for lamps and motors in that town.

WEST HAVERSTRAW, N. Y.—Bids will be received by George Blagdon, president of the board of managers of the New York State Hospital for Care of Crippled and Deformed Children, West Haverstraw, until May 22, for laundry equipment for the New York State Hospital for Crippled and Deformed Children. Drawings and speci-

cations may be consulted at the above hospital, at the New York office of the Department of Architecture, Room 1224, Woolworth Building, New York City, and at the Department of Architecture, Capitol, Albany, N. Y.

BLOOMFIELD, N. J.—Contract has been awarded by the Sprague Electric Company, Watsessing Street, for the erection of an addition to its plant to the Austin Company, Transportation Building, Philadelphia, Pa. The structure will be about 100 ft. by 180 ft., and the cost is estimated at \$35,000.

HOBOKEN, N. J.—The Lux Manufacturing Company, Fifteenth Street, has purchased a four-story factory on East Kinney Street, with about 50,000 sq. ft. floor space. The company manufactures large nitrogen and tungsten lamps. A. P. Baldwin is president and treasurer.

KEARNY, N. J.—Contract has been awarded by Swift & Company of Jersey City to the Ruggles-Robinson Company, 331 Madison Avenue, New York City, for the erection of a power house in connection with the construction of a new glue factory in Kearny. The cost of the entire plant is estimated at \$65,000. The company is also planning to build an addition to its engine house at 154 Ninth Street, Jersey City, for which plans have been prepared.

ORANGE, N. J.—A permit has been taken out by the Radium Luminous Materials Corporation for the erection of a new four-story building at 166 Alden Street.

TRENTON, N. J.—Preliminary plans are being prepared by J. Osborne Hunt, 114 Montgomery Street, Trenton, for the construction of a new power house at the plant of the John E. Thropp Sons Company, Lewis Street.

TRENTON, N. J.—Major Edmund J. Barry, who is in charge of the government munitions plant at Tullytown, Pa., has issued orders that additional power be supplied to the Trenton, Bristol & Philadelphia Street Railway from the power house of the Trenton & Mercer County Traction Company at Trenton. Transmission lines will be erected through the streets of Trenton across the Delaware River to connect with the line of the former company at Morrisville, Pa.

ERIE, PA.—The City Council has awarded the contract for lighting the streets of the city to the Erie County Lighting Company for a period of five years.

HARRISBURG, PA.—Bids will be received by the Board of Commissioners of Public Grounds and Buildings until May 14 for furnishing power plant specialties for the year ending May 31, 1919. George A. Shreiner is superintendent.

MIDDLEBURG, PA.—The Juniata Electric Company of Millin has taken over the plant of the Middleburg Electric Light, Heat & Power Company.

PHILADELPHIA, PA.—Bids will be received by the Department of Public Safety for improvements and alterations in the municipal power plant. William H. Wilson is director of public safety.

PHILADELPHIA, PA.—Permit has been taken out by the Royal Ascot Knitting Company, 92 Collum Street, for the construction of an addition to its boiler plant at 210 East Ashmead Street.

PHILADELPHIA, PA.—Plans have been prepared by the Electric Storage Battery Company for improvements to its building, including a new addition, at Nineteenth Street and Allegheny Avenue.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 20 under specification 2917 for furnishing an electric-lighting system for shipbuilding slip at Philadelphia. For further information address chief of bureau.

CUMBERLAND, MD.—Preliminary work, it is reported, has begun on the construction of the proposed plant for the Kelly-Springfield Tire Company of Akron, Ohio, in Cumberland. The present plans, it is understood, include the erection of a power station. The cost of the plant is estimated at \$1,000,000.

CHARLESTON, W. VA.—The Virginia Power Company is contemplating erecting additional transmission lines to Nitro, a distance of 16 miles, to furnish electricity to the federal government explosive plant. H. G. Scott of Charleston is general manager.

HARPERS FERRY, W. VA.—The Public Service Commission has approved of an issue of \$500,000 in bonds by the Northern Virginia Power Company, the proceeds to be used for the development of hydroelectric projects in the eastern panhandle of West Virginia.

ROSTOKE, VA.—The Norfolk & Western Railroad Company is planning to erect new shops and buildings at its Bristol yards to cost about \$500,000.

NORFOLK, VA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 13 for furnishing and installing cables, wire transformers, and accessories for the electric and telephone systems for dry-dock No. 4 at the navy yard at Norfolk. Drawings and specifications No. 2875 may be obtained at the above bureau or to the commandant of the navy yard named.

RICHMOND, VA.—The Virginia Railway & Power Company has awarded a contract to Nicholas & Linderman of Norfolk for alterations and improvements to its substation, to cost about \$11,700.

SEVEN PINES, VA.—Contract has been awarded by the War Department, Washington, D. C., to the Foundation Company, Woolworth Building, New York, N. Y., for the construction of a powder packing plant at Seven Pines, to cost about \$3,000,000. The project will include an electric power plant, heating equipment, large warehouse and 40 miles of railway trackage. E. J. du Pont de Nemours & Company of Wilmington, Del., will operate the plant for the Government.

WASHINGTON, D. C.—The Chesapeake & Potomac Telephone Company has awarded contract for the erection of a new telephone exchange building to the Samuel K. Prescott Company, 811 Thirteenth Street, N. W. The cost is estimated at about \$800,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 13, extension of date from May 6, under specification 2879 for installing substation switchboards at the navy yard, Washington. The cost is estimated at \$60,000.

WASHINGTON, D. C.—Bids will be received by the Commissioner of Indian Affairs, Indian Office, Department of the Interior, Washington, D. C., until May 20 for the installation of an electric-lighting plant at the Southern Ute School, Colorado. Plans and specifications may be examined at the United States Indian warehouse at Chicago, Ill., St. Louis, Mo., San Francisco, Cal., and the Builders' Exchange, St. Paul, Minn., and at the office of the superintendent of the Southern Ute School, Colorado. Cato Sell is commissioner.

North Central States

BELLAIRE, MICH.—A special election will be held on May 13 to submit to the voters the proposal to issue \$6,000 in bonds, the proceeds to be used for improvements to the municipal electric-light plant. It is proposed to establish a day service.

SPRINGWELLS, MICH.—Contract, it is reported, has been awarded by the Saxon Motor Company for the erection of a power plant in Springwells to Bryant & Detwiler.

COLUMBUS, OHIO.—An addition is being erected to the power plant of the Columbus Anvil & Forging Company. New equipment to increase the output of the plant nearly 50 per cent, it is understood, will be installed.

HAMILTON, OHIO.—Preparations are being made by the Shuler & Benninghofen Company of Hamilton for an extension to its power plant. Most of the equipment, it is understood, has been purchased.

LIMA, OHIO.—Steps have been taken by the Lima Advertising Club for the installation of an ornamental lighting system in the business district.

SANDUSKY, OHIO.—The Sandusky Gas & Electric Company is installing transformers to be used in connection with the high-tension line connecting its station with the high-tension service of the Lake Shore Electric Railway Company.

SANDUSKY, OHIO.—Property owners just outside of the city limits, near the bay shore, have petitioned the Sandusky Gas & Electric Company for electrical service. The district to be served is just beyond the present service lines of the company.

WAPAKONETA, OHIO.—Plans are being prepared by Kruckemeyer & Strong, architects, Cincinnati, for the construction of a new telephone exchange building for the Wapakoneta Telephone Company. The system to be installed has not yet been decided upon.

EARLINGTON, KY.—The St. Bernard Mining Company is planning to construct a large power plant in Earlington to supply power for its mines in this territory. Contract for electrical work, it is reported, has been awarded to the Westinghouse Electric & Manufacturing Company of Pittsburgh. The cost of the plant is estimated at \$500,000.

FRANKLIN, IND.—The construction of a new science hall, 125 ft. by 95 ft., to cost

about \$125,000, is under consideration by the trustees of Franklin College. C. F. Goodell is president.

SOUTH BEND, IND.—The installation of electrical equipment in the forge department and machine shops, to cost about \$27,000, is contemplated by the Studebaker Corporation.

CALUMET, ILL.—Bids will be received by John McGillen, clerk of the Sanitary District of Chicago, 380 South Michigan Avenue, Chicago, until June 6, for construction of the Calumet sewage pumping station as follows: Division A—consisting of a concrete and brick building, 80 ft. by 185 ft., with suction discharge basins, 15-ton hand crane, sluice gates and accessories, etc. Division B—pumping machinery, consisting of three 72-in. centrifugal pumps, with suction and discharge and vacuum piping, priming pumps and accessories; one 72-in. centrifugal pump in addition may be ordered at the option of the Sanitary District. Division C—electrical equipment, including six 1000-kva. transformers, three 1100-hp. synchronous motors, two 450-hp. synchronous motors, three 300-hp. synchronous motors, six 50-kva. transformers, two 75-kw. motor-generator sets, and oil switch equipment. Division C—switchboard, conduit and wiring, including control switchboard and accessories, conduit and wiring for connecting all electrical equipment and for station lighting and power, installation of electrical equipment. Specifications, forms of proposal and plans may be obtained at the above office.

CICERO, ILL.—Bids, it is reported, are being asked by the Western Electric Company of Chicago for the construction of a new factory, six stories, at Cicero, to cost about \$800,000.

JANESVILLE, WIS.—The Supervisors of Rock County are considering the installation of an improved lighting system at the County Asylum and Almshouse. Supervisor Perrigo is chairman of the special committee.

MILWAUKEE, WIS.—The Pfau Motor Pump Company, 248 Fourth Street, recently incorporated with a capital stock of \$30,000, is contemplating the construction of a new plant. The company manufactures electrically driven compressed-air water-pumping systems.

OSHKOSH, WIS.—The Oshkosh Gas Light Company is building a new power plant on the north bank of Fox River. The building will be about 100 feet square and 90 feet high. Three new boilers equipped with automatic stokers are being installed in the boiler room.

HASTINGS, MINN.—Bids will be received by the Minnesota State Board of Control, State Capitol Building, St. Paul, until May 14, for construction of the west wing to main building of the State Asylum at Hastings, including general contract work, heating and ventilating, electrical work and plumbing. Plans and specifications are on file at the office of the Board of Control, Builders' Exchange, at St. Paul and Minneapolis, and at the office of C. H. Johnston, architect, Capital Bank Building, St. Paul.

PRINCETON, MINN.—Bids will be received by the board of education, Princeton, until May 20, for the construction of a high school building. Separate bids to be submitted on mechanical equipment. Plans and specifications are on file in the office of A. B. Gramer, city clerk. Foss & Foss of Elbow Lake, Minn., are architects.

CLINTON, IOWA.—The Climax Engineering Company, it is reported, has purchased the property of the Klein Paper Mill on the Beaver Slough at the foot of Fifth Street, on which it will erect a new plant, including a power house, which will be equipped with a 500-hp. engine and generators. Orders have been placed for machinery.

LADORA, IOWA.—A company is being organized under the name of the Farmers' Electric Light Association to install and operate an electric-lighting system in Ladora.

MANCHESTER, IOWA.—The Delaware County Light & Power Company, recently incorporated, has purchased the Quaker Mill property about two miles up the river from Manchester, which it proposes to develop to generate electricity and transmit it to Manchester. The company will also continue the mill and feed grinding business. The company is capitalized at \$25,000. Joseph Hutchinson is president, and Harry Seeds, secretary and treasurer.

MONTICELLO, IOWA.—The Monticello Electric Company is contemplating extending its electric transmission lines out of the city to supply electrical service to the farmers west of the town as far as Linn County.

WASHINGTON, IOWA.—Bids will be received by the board of education, care of

R. W. Thompson, secretary, until May 17 for construction of a high school building, including heating, plumbing and electric wiring. The cost is estimated from \$140,000 to \$150,000. C. A. Doleman & Company, Grandby Building, Cedar Rapids, are architects.

YORKTOWN, IOWA.—The Leo Electric Light & Power Company has submitted a proposal to the Town Council offering to erect an electric transmission line to Yorktown from its line running from Shenandoah to Clarinda to supply electricity here for \$5,000.

KANSAS CITY, MO.—Bids will soon be awarded by the Kansas City Railways Company for the erection of a substation at 1017 Oak Street, to cost about \$25,000. C. E. Fritts, Fifteenth and Grand Avenues, is electrical engineer.

KANSAS CITY, MO.—J. F. Porter, president of the Kansas City Light & Power Company, has announced that work on the construction of its large plant at Brooklyn Avenue and the river front will be resumed. Work on the foundation was held up after the general strike.

KIRKSVILLE, MO.—Extensive improvements are contemplated by the Adair County Light, Power & Ice Company to its plant and system.

LITTLE BLUE, MO.—The Green Light & Power Company, which supplies electrical service in Lees Summit, is contemplating extending its lines to Little Blue.

PLATTSBURG, MO.—The Clinton County Telephone Company has authorized an issue of \$6,500 in bonds for improvements to its system.

COURTENAY, N. D.—A second generating unit, consisting of a General Electric 37½-kva., 60-cycle, 2300-volt alternator and a 35-hp. Muncie oil engine, is being installed in the municipal electric-light plant. As soon as improvements are completed a day service will be established. G. D. Roth is manager.

MADDOCK, N. D.—Preparations are being made for the installation of an electric-lighting system in the city of Maddock, for which bids have already been received.

GURLEY, NEB.—Preparations are being made for the installation of a municipal electric-light plant, for which bids have already been received. Royal D. Salisbury, 1415 East Colfax Avenue, Denver, Col., is consulting engineer.

LYNCH, NEB.—Bonds to the amount of \$7,800 have been voted for the installation of an electric-light plant in Lynch.

NORFOLK, NEB.—Plans are being prepared for the construction of a power house at the State Insane Hospital at Norfolk, to cost about \$40,000. Bids for construction, it is understood, will soon be asked by the Board of Commissioners of State Institutions. Plans are also being prepared for the construction of ward building for the above hospital, to cost about \$70,000. J. C. Stitt is architect for both buildings. Leo Matthews of Lincoln is secretary of board.

BROOKVILLE, KAN.—Bonds have been voted to provide funds for the erection of an electric distribution system in Brookville. Energy to operate the system will be purchased from the Central Kansas Power Company of Manhattan.

CONCORDIA, KAN.—The pumping station of the Concordia Electric Light Company was recently destroyed by fire.

EDGERTON, KAN.—At an election to be held May 14 the proposal to issue \$5,000 in bonds for the erection of an electric distribution system in Edgerton will be submitted to the voters.

GARDNER, KAN.—At an election to be held May 14 the proposal to issue \$10,000 in bonds for the installation of an electric-light plant will be submitted to the voters.

GARNETT, KAN.—The City Council has called an election to be held June 4 to submit the proposal to issue \$65,000 in bonds for improvements to the municipal electric-light plant and water-works system to the voters. Black & Veatch, 507 Inter-State Building, Kansas City, Mo., are engineers.

WICHITA, KAN.—Plans are being prepared for a power house and laundry for the St. Francis Hospital, to cost about \$20,000. E. Forsblom, Winne Building, is architect.

WICHITA, KAN.—The contract for electric wiring of the new addition to the Forum Building has been awarded to the Southwestern Electric Company. The cost of the entire work is estimated at \$130,000.

WINFIELD, KAN.—Work will start at once on the construction of a building for the St. Mary's Hospital. The plans provide for the installation of electric passenger elevator, dumb waiter, refrigerating system, electric wiring, etc. The cost is estimated at \$80,000. H. L. Stevens & Company, 900 South Michigan Avenue, Chicago, Ill., are architects and contractors.

Southern States

CHARLOTTE, N. C.—The city of Charlotte would like to receive proposals from manufacturers of pumping equipment upon certain centrifugal pumping units. Further information may be obtained at the office of the commissioner of public works or Anderson & Christie, consulting municipal engineers of Charlotte.

BRANCHVILLE, S. C.—Prescott Ott, it is reported, is in the market for equipment for an electric-light plant.

REIDSVILLE, GA.—Bonds to the amount of \$10,000 have been voted for the installation of a municipal electric-light plant.

SARASOTA, FLA.—A movement has been started by the Board of Trade for the purchase of the property of the Sarasota Ice & Electric Company, which now furnishes electrical service in the city. The company has a 30-year franchise with provision that the city may purchase the plant at the end of any 10-year period. The board proposes the purchase of the plant by the city and the installation of the necessary machinery to furnish a 24-hour service. The City Council has engaged a consulting engineer to make investigations.

LYLES, TENN.—The Bon Air Coal & Iron Corporation of Nashville, it is reported, will construct and operate a wood chemical plant for the United States government. The cost of the plant is estimated at \$1,300,000 and will include power house, stillhouse, 20 retorts, etc. The George A. Fuller Construction Company, Fuller Building, New York, N. Y., has the contract.

GADSDEN, ALA.—Work has begun by the Alabama Power Company on the installation of the division switchboard and meters to be used in delivering energy to operate the local water-works system. It is proposed to change the plant from steam to electric power. Orders have been placed for motors and pumps.

CLARKSDALE, MISS.—Bids will be received by the school board, addressed to R. E. Stratton, city clerk, Clarksdale, until May 22 for construction of school building including heating, plumbing, electric-lighting, etc. Bonds to the amount of \$95,000 have been issued for building and equipment. Plans and specifications may be obtained from R. H. Hunt of Chattanooga, architect.

GUEYDAN, LA.—The city is contemplating the installation of a municipal electric-light plant for which \$15,000 in bonds have been voted.

NEW ORLEANS, LA.—The Liberty Manufacturing Company, recently incorporated, has acquired a plant at Carrollton Avenue and Olander Street, and will engage in the manufacture of electrical and foundry machinery and other products. Eph. Rosenberg is president and B. B. Hans, secretary and treasurer.

JENNINGS, OKLA.—The City Council is considering calling an election to submit the proposal to issue \$25,000 in bonds for an electric lighting system, \$20,000 for water-works, \$20,000 for sewers, and \$18,000 for an ice plant to the voters.

MIAMI, OKLA.—Bids will be received until May 18 for the construction of a hospital at the Baptist Sanitarium at Miami. Separate bids to be submitted on vacuum steam heating, plumbing, electric wiring and electric elevator. A. J. Bellis, 615 Grear-Leslie Building, Kansas City, Mo., is architect.

OILTON, OKLA.—The Council has granted the Central Oklahoma Lighting & Power Company a franchise to furnish electricity in Oilton for commercial purposes.

SHATTUCK, OKLA.—Improvements to cost about \$20,000 are contemplated to the municipal electric light plant, and also to the waterworks, to cost about \$50,000. Burns & McDonnell, 402 Inter-State Building, Kansas City, Mo., are engineers.

TULSA, OKLA.—The Commerce Building Corporation, First National Bank Building, Tulsa, has awarded contract for construction of a bank and office building at 324 Main Street to the George A. Fuller Construction Company, Dwight Building, Kansas City, Mo. The plans provide for the installation of a private lighting plant. The cost is estimated at \$500,000. Rush, Endacott & Rush, 226 Unity Building, are architects.

AUSTIN, TEX.—Contract has been awarded by the War Department, Washington, D. C., for the construction of cantonment buildings at Camp Mabry, near Austin, for aviation field to J. F. Johnson of Austin, to cost about \$400,000.

KNIPPA, TEX.—Preliminary surveys have been made for the construction of a large hydroelectric power plant on the Frio River, near here, and a large irrigation

system. The site of the proposed dam is located about 14 miles north of Knippa, and will have a capacity of about 5000 acre ft., which will irrigate about 100,000 acres of valley land. Electricity generated at the proposed dam will be transmitted to San Antonio and a number of smaller towns. Charles A. Lindsey of Wichita, Kan., and associates have applied to the State Board of Water Engineers for authority to divert and utilize the water of the stream.

TOM BEAN, TEX.—A company has recently been organized for the purpose of installing and operating an electric-lighting plant in Tom Bean.

Pacific and Mountain States

CHEHALIS, WASH.—At an election held April 20 the proposal to grant C. E. Anderson and associates of Portland, Ore., a franchise to operate a second electric-lighting and power system in Chehalis was defeated. The North Coast Power & Light Company, which furnishes electrical service here, has recently (voluntarily) granted a reduction in its rates of approximately one-third.

EVERETT, WASH.—The City Council has engaged Burns & McDonnell of Kansas City, Mo., to make investigations and prepare estimates of the cost of establishing a power plant in the upper Sultana River district.

OLYMPIA, WASH.—Application has been filed with the state engineer by P. C. Kaylor for 9000 second ft. of water from the Spokane River, to be used for hydroelectric development.

SEATTLE, WASH.—Equipment is being installed by the Coast Engine Company of Seattle for the manufacture of small electric lighting plant to be operated by heavy oil engines of 2½ hp.

SPOKANE, WASH.—Application has been filed by the Washington Water Power Company of Spokane for permission to construct a reservoir and store unappropriated waters of the Baker River, to the amount of 30,000 acre ft., to be used for power development. The cost of the proposed project is estimated at about \$1,000,000.

ASTORIA, ORE.—The contract for the installation of electric wiring and equipment for the new bulk grain storage bins and workhouse has been awarded to the Ewart Electric Company of Astoria, at \$9,588.

GRANTS PASS, ORE.—The Crown-Willamette Paper Company of Grants Pass has been granted permission by State Engineer Lewis to appropriate 200 second ft. of water from Young River, near Astoria, for the development of 2273 hp. The cost of the proposed plant is estimated at \$150,000 and will include the construction of an 80-ft. dam, short pine line and power house.

PORTLAND, ORE.—An ordinance has been introduced to the City Council providing for an issue of \$4,000,000 for the purchase of a large tract of land as a site for a new power plant.

PORTLAND, ORE.—Application has been filed by the Valley Development Company of Portland with the State Engineer for a permit to divert waters of Lake Creek, Clear Fork, Johnson Creek and Glacier Creek for the purpose of generating electricity for transmission to cities and towns for manufacturing, mining and domestic purposes. The company has also asked for permission to construct a reservoir in Lake Creek and Clear Fork.

SALEM, ORE.—John R. Lewis, state engineer, has been advised that the federal government has withdrawn several thousand acres of public lands suitable for water power developments from the Oregon-California Railroad grant acreage. About 100 townships are affected along the Nehalem, Umpqua, Siuslaw, Siletz, Rogue and Smith Rivers and their tributaries.

TOLEDO, ORE.—The Thorsen-Hendricksen Mill Company has been reorganized and its name changed to the Lincoln County Light & Power Company. The plant now supplies electricity in the towns of Toledo and Newport. New equipment, including a 2000-hp. turbine and generator, will be installed. The additional power will be used to operate a large band sawmill which the company will erect in Toledo.

LOS ANGELES, CAL.—Plans are being considered by the City Council for the installation of an electric-lighting system in Fifty-fifth Street, from Budlong to Normandie Avenue. It is proposed to use marbelite standards.

LOS ANGELES, CAL.—The City Council has appropriated \$79,000 for extensions to the municipal distribution system to all parts of the harbor sections, including the extension of the power transmission lines

of Fish Harbor on Terminal Island, the latter to cost about \$34,000.

LOS ANGELES, CAL.—Negotiations are under way between the City Council and the Harbor Commissioners for the lease of property on the harbor boulevard as a site for the proposed new municipal substation which is to furnish energy in the West Basin and Wilmington districts.

MARE ISLAND, CAL.—Bids will be received at the Bureau of Yards and Docks, Washington, D. C., until May 20 for furnishing and installing one 6000-lb. capacity freight elevator and supporting structure in the machine shop extension at the navy yard, Mare Island. Bids will also be received at same time at the navy yard, Mare Island. Drawings and specification No. 2936 may be obtained at the above bureau or the commandant of the navy yard named.

OROVILLE, CAL.—Negotiations are under way between the federal government and the Great Western Power Company of San Francisco for the construction of a hydroelectric plant to cost about \$5,000,000.

OROVILLE, CAL.—Plans for the construction of another large hydroelectric plant in the Feather River District have been announced by a group of Oroville men, providing for the conversion of the Great Bald Rock Canyon into a large impounding reservoir. This, it is said, can be accomplished by constructing a dam 1160 ft. in length and 650 ft. high. With this dam a total fall of 1750 ft. can be obtained, capable of developing 166,000 hp. Present plans provide for this development in three units, the first power plant to be located at the foot of the dam. A second power house is proposed for Canyon Creek, while a third plant would be situated near Bidwell Bar. The total cost of the project is estimated at \$7,500,000. Among the promoters are: Paul Reicker, civil engineer; W. L. Curran of Oroville; George C. Riley and A. J. Walsh, both of Sacramento.

SAN DIEGO, CAL.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., and at San Diego, Cal., until May 27 for constructing at San Diego, Cal., commandant's house, officers' quarters and barracks for 400 men.

STRATHMORE, CAL.—With the completion of the substation at Strathmore the San Joaquin Light & Power Company will receive energy from the plants of the Mount Whitney Power Company and the Southern California Company. The companies affected by the tie-in at Strathmore are the Mount Whitney Power & Electric, the San Joaquin Light & Power, the Southern California Edison and the San Diego Consolidated Gas & Electric Companies.

VERNAL, UTAH.—The Vernal Milling & Light Company has filed amendments to its charter increasing its capital stock from \$100,000 to \$150,000.

ARCO, IDAHO.—At an election held recently the proposal to issue \$10,000 for the installation of an electric light and power plant was defeated.

MALTA, MONT.—The new electric-lighting system will soon be placed in operation in Malta.

SNOWFLAKE, ARIZ.—Contract has been awarded by the Snowflake & Taylor Irrigation Company for the installation of an electric-light and power plant. As yet none of the equipment has been installed. The company contemplates beginning work on the construction of a hydroelectric plant about July 8. H. T. Lloyd of Wickenburg has the contract.

YUMA, ARIZ.—The Yuma Gas, Light & Power Company has begun work on the installation of a new transformer at its local substation.

Canada

NORTH VANCOUVER, B. C.—The City Council is considering an option on the property of the Nairn Falls Power Company with a view of developing hydroelectric power.

WHITE ROCK, B. C.—Arrangements have been made by the local water works company with the British Columbia Electric Railway, Power & Light Company to equip the local pumping station for electrical operation.

ST. JOHN, N. B.—A new 550-hp. steam power plant will be installed in connection with the new plant now being built by T. McAvity & Sons, Ltd. The company will need a total 1000 hp., of which only 450 hp. can be developed by the present plant.

BERWICK, N. S.—The installation of an electric-lighting and power plant to cost about \$50,000 is under consideration by the Town Council.

(Closed April 23, 1918.)

Problems Involved in Interconnection

INCREASE in the size of transmission systems has been attended with a great amount of interconnection between auxiliary stations on the same initial system, between parts of a single network, and even between separate networks which have found it desirable to provide facilities for exchange of power. Speaking in broad terms, the practical working out of interconnections, involving the running of many scattered stations in parallel, has been solved very successfully. The length of the lines involved furnishes a sort of electrodynamic buffer which is very effective in preventing disturbing reactions between two stations. Important information on the results that are practically attainable is given in the current issue in the article by J. P. Jollyman, engineer of the Pacific Gas & Electric Company.

It appears that fairly long lines operating at voltages even 10 per cent apart can be interconnected without particular difficulty and that very little disturbance is created by additional lengths of line unless the charging current is exceptionally large. Sometimes in paralleling two lines of different total length at two common points trouble is caused by unequal distribution of load. The solution for this difficulty is to parallel the systems at one point only so that unequal distribution of load can be minimized.

Apparently the chief annoyance which has been found in practice is caused by connecting two fairly large systems with a long line having relatively small carrying capacity. In such instance the waterwheel governors may fail to work in harmony and establish a condition of hunting even up to the extent which will cause the systems to drop out of synchronism. With connections of large carrying capacity this is much less likely to occur. The same risk of going out of synchronism is encountered when energy is exchanged between two systems through a frequency changer, as now and then occurs. This case is somewhat similar to the hunting of synchronous converters, an occurrence that was unpleasantly familiar in the early days of their use.

Interconnection is the order of the day between great systems of the Pacific Coast. Some eight or ten interconnections with capacities up to 10,000 kw. are in daily use and excellent results are being obtained from every standpoint. A careful investigation was made last year of the situation. In a few instances it was found that considerable benefit could be realized by making additional interconnections. Other possible interconnections would have cost more than the bene-

fits would have warranted. The chief problem is to avoid conditions which will lead to hunting. These are now pretty well understood, and little serious trouble is to be expected from them.

The Large Joint Convention in California

THE Far West has consistently lived up to the policy that conventions in war time are even more necessary than before. This belief has led to extremely helpful meetings in which the paramount purpose has been the extension of "win the war" service. The joint convention held last week at Del Monte, Cal., was not only typical of this spirit but it was the more effective and made greater progress because of a similar meeting last year at Riverside. This year no preliminaries were necessary, and work was begun at once on a program in which "win the war" service was the underlying thought in every session. The trend toward consolidation of systems showed markedly in discussions in which representatives of the Railroad Commission, the Petroleum Administrator and others directly interested joined. Discussions showed how absolutely essential to the conduct of war industries the production of energy is.

It was also brought out that the producers of electrical energy are now wholly dependent upon government action. Government aid is being sought in financing further developments, the use of fuel will be subject to government refusal, priority orders must be secured for additional equipment, incomes can be maintained only if rate increases are permitted, and permission must be secured even now to refuse service beyond capacity. In short, war conditions are tending to make the government paternal in character. Labor alone, it was shown, is the one thing thus far uncontrolled, and some hold that it would be in much more stable condition were it too under government regulation.

Sessions of the jobbers' convention advanced the perfection of organization; central-station representatives discussed economies of various kinds and also means of meeting the increasing energy demands, while all joined with the dealers in furthering the co-operative commercial educational campaign that means so much to improved merchandising facilities. But, perhaps most important of all, the convention fostered more intimate acquaintance of the sort that begets confidence. Those in attendance carried away a generous portion of the enthusiasm so helpful in these times, the warm-hearted enthusiasm which seems so natural a feature of Western conventions.

Operation of the Fuel Zone System

WE PRESENT for our readers this week a map of the zone system established by the government authorities for bituminous coal, showing the districts into which the country is divided for the purposes of coal distribution, with suitable explanation of the available sources applying to these districts. Of course, our readers well understand the fundamental purpose of this specified distribution, to eliminate the unnecessarily long hauls which have characterized coal movements in the past. So long as there was no fuel shortage every one turned to some favorite sort of coal, whatever the length of the haul that brought it to him, unless the price was raised by transportation to an entirely prohibitive figure. Even so the favoring of long hauls in general increased the complexity of distribution until if one had marked out on a map the distribution lines from each source of coal the whole system would have reached amazing complexity. The general upsetting of ordinary conditions by the demands of the war rendered somewhat desperate measures necessary, and the zone system is the logical result.

We long ago passed out the general warning that the time was coming when the burning question would be not what kind of fuel but any kind of fuel, and that users of coal had better make up their minds to accustom themselves to that which could be obtained within comparatively easy reach. A great many experiments have been made in the utilization especially of low-grade fuels, and not a few large users have found it to their advantage that some easily available sources could be utilized quite irrespective of past custom. The present regulations will enforce more liberal views as to the possibilities of fuel, sometimes at considerable inconvenience to the individual user, but here as elsewhere those who have remembered that we are at war and have looked ahead toward some of the necessary results will find themselves in the best position to face the exigencies that arise as a result of the situation.

A Successful Change of Systems

THE brief account by M. C. Dean of the New York & Queens Electric Light & Power Company concerning the general change-over in that system ought to arouse interest. The situation to be met was a serious one. The distribution circuits had to be increased in rating something like 30 per cent. In one large district the current-carrying capacity of both feeders and regulators had been reached, and it was necessary to apply means for immediate relief. Of the three courses open—additional 2300-volt, two-phase feeders; high-tension feeders to relieve those operating at 2300 volts, and, finally, changing from a 2300-volt, two-phase, to a four-wire, three-phase system—the last mentioned was chosen. It was found that the necessary rating could be provided for less than half the expenditure required by other methods and that the feeders would have 50 per cent greater capacity as three-phase feeders than as two-phase feeders. Besides this, the line losses are reduced. The four-wire, three-phase system is one of

the most economical in the use of copper; wherever it has been used it has worked out admirably. The only reason that it has not been employed more extensively seems to be sheer timidity on the part of engineers.

The chief work that had to be done in making the change-over was in connection with the transformer banks serving power loads. Here old two-phase customers were allowed to remain, but new ones are furnished from the three-phase service. To permit this, one transformer from each power bank was replaced by two of half the rating, having 10 per cent taps giving the necessary phase relations. To simplify the changes this replacement was made in advance, leaving the two transformers simply in multiple, to be swung into the three-phase connection later. No change was made in the overhead circuits, which were already four-wire.

Since the change-over was made everything has been working smoothly, and as a result it has been unnecessary to install additional two-phase feeders. The line losses have been lessened by 200 kw., enough to pay full interest on the cost of the change-over, and the voltage regulation has been improved 100 per cent. Conversion of the rest of the company's distribution is likely to follow. The scheme is well worth the attention of other companies which find themselves short of feeder capacity.

Results from the Burning of Powdered Coal

THE coal crisis has driven engineers to extremities for a suitable supply of fuel. With the cost of liquid fuel rising rapidly, with wood at nearly prohibitive figures, and with the zone distribution ahead, compelling the use of fuel within easy reach, one is hard put to it for hope of economy. The conditions have caused reversion to several schemes which have been tried before with varying success. Briquetting has taken a new lease of life. Peat is coming again into notice, and the use of pulverized coal blown into the fire box by compressed air now seems to offer a fair chance for economical working. In the current issue A. E. MacInnis gives a very instructive account of some of the experiments with powdered coal made in the Northwest.

One of the most notable installations of this kind is in the plant of the Puget Sound Traction, Light & Power Company of Seattle, on which we commented last year. The final result of that preliminary work was so satisfactory that a new plant for an aggregate rating of 4100 boiler-hp. is now under construction. In the original test the powdered coal was prepared at a nearby briquetting plant where likewise pulverized coal is in use.

The advisable fineness of the finished product depends on the character of the coal. The higher the fixed carbon the further should pulverization be carried. With the local coal here employed it was ground until 85 per cent would pass through a 200-mesh machine and 95 per cent through a 100-mesh. This very finely ground fuel is fed to the boilers by compressed air. In some respects the burning of pulverized fuel is like that of some special coals in that large furnace space is necessary. In this instance a Dutch oven was built in front

of the boiler to give suitable combustion space. A large number of coals were tried. Some of them were fairly good, others particularly poor. All were, of course, thoroughly dried before pulverizing, some running very high in moisture in the raw state.

The net result showed that combustion of pulverized coal can be carried on at good efficiency even in the case of the low grade coals. The fire produced is easy to manage, smokeless and capable of being forced with great rapidity to carry peak loads.

In the new plant raw coal is to be delivered over street-railway tracks and dumped into a bunker which serves as a source of supply. Then it is crushed, dried, powdered coal being used for this purpose, and finally pulverized. From the grinding mills the coal goes over a system of conveyers to the steel bins over the front of the boilers. These have 15 tons capacity and feed the coal to the air blast. Slag pits are provided underneath the furnaces.

Besides this considerable plant for Seattle the Pacific Coast Coal Company is running at two of its own mines banks of boilers fired with pulverized coal, in each case aggregating more than 2000 boiler hp.

The general results thus far reached seem to indicate that under favorable conditions of fuel supply very excellent results can be obtained with powdered coal—good enough at least to encourage further work on a considerable scale. Certainly no subject is more vital to the central-station engineer, and the results which are reported in this case should serve to stimulate further research in other sections of the country.

Sudden Short Circuits of Alternators

WHEN an alternator is running steadily at synchronous speed it is well known that, in addition to its armature resistance, it possesses a certain reactance which is ordinarily considerably greater than the resistance. This apparent reactance is called its "synchronous reactance." It is much greater than would be accounted for by its self-inductance, owing to the effects of armature reaction. It is assumed in dealing with the subject that the changes in the electric circuit take place so slowly that the effects of armature reaction can fully develop. The synchronous reactance will then reveal itself. The synchronous impedance of the armatures will then likewise present itself as the vector sum of the resistance and synchronous reactance.

However, if the electric circuit of the running alternator be changed suddenly, the reactance presented

initially in the armature will be much less than the synchronous reactance and will approximate that due to the self-inductance of the armature alone. The initial impedance of the armature, being the vector sum of the resistance and initial reactance, will be much less than the synchronous impedance; so that the initial change of current in the circuit will be greater than that which the synchronous impedance would allow. After the lapse of a few seconds, the armature reaction has time to develop and to restore the armature impedance to its synchronous value. If, then, a sudden short circuit is applied to an alternator near its armature terminals, the initial short-circuit current tends to the value produced by the initial internal emf. divided by the initial vector impedance. This is commonly a much stronger current than flows after a few seconds, when the armature reaction has brought the reactance back to its synchronous value.

The characteristics referred to are unfortunately just the reverse of what a central-station manager would desire to see in force. He would like to have the initial armature reactance large, so that a sudden short circuit would come on gradually and give the time relays a chance to act before the mechanical stresses on the machine became excessive. On the other hand, he would prefer that the synchronous reactance should be small, so far as concerns the automatic regulation of terminal voltage in the machine under imposed changes of load.

With the facts as they are, a sudden short circuit tends to force an enormous initial current through the armature, with correspondingly enormous mechanical stresses in the machine. After a brief interval this current falls off to what may be called its synchronous value. In order to set a limit to the severity of the mechanical blow on the machine in the case of a short circuit just outside the power house, it has become common practice to install external reactors in the station. The fixed reactance of these devices takes the place of some of the lost synchronous reactance in the first stages of a sudden "short."

The belief is now generally accepted that the strength of the short-circuit current from an alternator falls off exponentially from the initial value to the synchronous value. It is not easy, however, to say how rapidly the descent will be made. In other words, the attenuation factors of the alternator field flux and of the armature current depend upon a variety of conditions, which are discussed in detail by N. S. Diamant this week in an extensive article upon the whole subject. In the case of large central-station alternators the matter is of great practical importance.

WAR has brought to every one in the electrical industry problems which are so different from those in the past that the only way they can be solved effectively is by the aid of a clearing house through which ideas can be exchanged freely. The ELECTRICAL WORLD recognizes its duty to serve as such a clearing house for the electrical industry and takes this opportunity to invite its readers to make use of it. Among problems which it sees the need of discussing particularly are the following: Shortage of materials, apparatus and labor and how to meet it, making existing equipment serve in-

The Coming Issues

creased loads, assuring reliability of service, increasing economy of operation, serving war industries, and guarding against fuel shortage next winter, either by assuring an ample supply of coal, adapting furnaces to low-grade coal or a substitute, or utilizing water power. In addition, all companies operating interconnected systems should give others the benefit of their experiences regarding the economies they have effected by interconnecting their plants. Articles in coming issues of the ELECTRICAL WORLD will cover a wide range of subjects along the lines mentioned above.

Operation of Interconnected Systems

Relative Importance of the Problems Which Are Encountered in This Connection—Swinging of Loads Must Be Considered in Connecting Systems, Especially in Those Cases Where Frequency Changers Are Used

BY J. P. JOLLYMAN

Engineer of Electrical Construction Pacific Gas & Electric Company

THE requirements of the times for more power and for the utmost utilization of all existing generating equipment have led to considerable extension of interconnected operation. In some cases the interconnecting lines may be long as compared with any other of the lines operated by either or both of the systems. Sometimes the capacity of the interconnecting line may be small relative to the capacity of the systems tied together. Occasionally the interconnection may be between systems of different frequency involving the use of frequency changers. Under any of these conditions or where a combination of them may be found new operating problems will arise. Some of the experiences in connection with one of the most extensive interconnected networks in this country may be of interest to those who are interested in rapidly expanding systems.

Unless the kva. required to charge the additional line seriously increases the load already carried by the generator or generators, no difficulty should be anticipated from making a considerable extension to an existing line. Even if the charging kva. is considerable, no harm can result

aside from that which may be caused by a sudden rise in voltage at the generator terminals when the line is charged.

As is quite generally understood, exact equality of voltage between systems is not necessary when synchronizing over a line of some length. In fact, no difficulty should be experienced with voltages 10 per cent apart or even more if the connecting line is quite long. The only result will be a small exchange of wattless current; the system with the higher voltage will supply some excitation to the other system.

In the development of an interconnected network cases sometimes arise where it becomes desirable to parallel two systems at two points and where the lines connecting these points are of quite different length. In such cases the shorter line or the line with the lowest impedance will naturally take on the most load. To keep both lines fully loaded it will therefore be

necessary to distribute the load between the lines and connect them in parallel at one point only. Paralleling of low-tension networks may be prevented by a difference in transformer connections in the parts to be connected, but this obstacle is not peculiar to interconnected operation.

One of the most troublesome situations which can be encountered in interconnecting two systems arises when each has considerable generating capacity and load of its own and the connecting line has considerable length and relatively small carrying capacity. If such a line is heavily loaded, there will be a decided tendency for the system to pull out of synchronism. This tendency arises from the nature of the speed control of transmission systems and may be explained as follows:

Consider two transmission systems A and B, each of which has generating facilities and a load of its own and which are interconnected by a line which transfers energy from system A to system B. Assume that a considerable load comes onto system B. The additional energy required will at first be drawn from the flywheels of all synchronously re-

volving apparatus, causing a reduction in speed. As the speed starts to decrease the governors will make the prime movers supply more energy to the generators and gradually bring their speeds back to normal. Momentarily, however, some of the energy required to carry the increased load on system B will be taken from the flywheels in system A and will flow over the interconnecting line. With increased load on the line an increased impedance voltage will be required between the two ends; hence there will be an increased difference in phase between systems A and B. The change in phase difference between two large systems may cause a swinging effect between the two systems which will overload the tie line and allow the systems to drop out of synchronism.

The action mentioned may be compared with that which would occur when two steam turbines each carrying a load of its own are coupled with a light shaft

FIG. 1—SUBSTATION NEAR SACRAMENTO, CAL., WHICH SECTIONALIZES TRANSMISSION LINE OPERATING AT 100,000 VOLTS

the ultimate strength of which is much less than the rating of the turbines and a considerable load is thrown on one turbine. The energy required to carry the additional load must be drawn from the energy stored in the rotors of the turbines by a reduction of speed. The energy thus drawn from the first turbine must be transmitted over the light connecting shaft, which will thereby be subjected to torsional stresses that will cause a change in the angular position of the two turbines and may even cause the breaking of the shaft. Even if the shaft is not ruptured by the first load change, a torsional oscillation may be set up between the two turbines which will lead to a final rupture in the event of some load change coinciding with an oscillation.

Evidently the condition most likely to cause a "swing" will exist when energy is exchanged first in one direction and then in the other. The only remedy for this difficulty is to avoid overloading the interconnecting line, and especially to avoid establishing a condition that will cause rapid reversals in the flow of energy to take place. If the systems are large, the interconnect-

FIG. 3—TRANSMISSION LINE OF ONE OF THE PACIFIC COAST COMPANIES

ing line must have considerable carrying capacity over and above that required to carry the exchange power. This extra capacity must be sufficient to care for the rapid changes in load since the governors on the generators of the system on which a load increase has occurred may not act until after the governors of the other system have increased the supply of energy and thus supplied all the increased load over the interconnecting line.

An interconnection made through a frequency changer acts in a manner similar to a line of considerable length. From no load to full load the shaft of a synchronous motor will lag about 25 electrical degrees behind the phase of the impressed voltage. The same lag takes place between the shaft and the delivered voltage of the generator. In a fully loaded 25 60-cycle frequency changer the relative phase of the 60-cycle system will lag 85 deg. behind its phase for no load on the frequency changer. The difference in phase arises from the fact that the 25-deg. lag of the shaft of the frequency changer, due to full load on the

motor, is equal to 60 deg. lag on the 60-cycle generator. To this 60 deg. lag is added the 25-deg. lag of the generator under full load.

Swinging similar to that due to a long small tie line may thus take place between two systems interconnected with a frequency changer. The swinging will be greater in degree with the frequency changer than with the line. There is no way to overcome the difficulty due to the characteristics of a frequency changer unless the load transferred can be kept from fluctuating rapidly.

No difficulty need be anticipated from increased mileage of electrically connected network if the experience of the Western companies operating networks containing over 2000 miles (3218.6 km.) of high voltage circuits may be taken as a guide. In some cases these lines connect points over 400 miles (643.7 km.) apart.

Fuel Oil for State Electrical Plants

United States Consul William Dawson, Montevideo, Uruguay, writes that by a resolution the Uruguayan government has approved the action of the Administration General of State Electrical Plants in declaring that of the 7000 tons of fuel oil on hand in the deposits of the West India Oil Company 5000 tons be reserved for the state electrical plants and that the latter receive the preference in the distribution of cargoes arriving hereafter. The state electrical plants burn fuel oil which is supplied under contract by the West India Oil Company, and one of the clauses of the contract provides that if at any time the supply shall not suffice to meet all demands the state plants shall enjoy preferential treatment.

St. Louis Company Equipping Own Coal Mine

The management of the Union Electric Light & Power Company of St. Louis more than a year ago, appreciating the trend of conditions and anticipating the coal needs of the company, adopted a plan to guarantee as nearly as possible its future fuel requirements. This plan embraced the control and operation of a coal-producing property within a convenient distance of the generating station. In pursuance of it control had been acquired of 3143 acres (1271 hectares) of coal land in Jackson and Perry Counties, Ill., about 5 miles (8 km.) south of Du Quoin, 80 miles (128.7 km.) from St. Louis on the Illinois Central double-track line from St. Louis to New Orleans. On this track a mine is now being developed which will be equipped to screen and prepare 6000 tons of coal daily. Two seams of coal are available, one averaging 4 ft. to 5 ft. (1.2 m. to 1.5 m.) in thickness and the other ranging from 6 ft. to 14 ft. (1.8 m. to 4.2 m.), and the extractable tonnage is estimated at approximately 28,000,000 tons. If an annual production of 800,000 tons is maintained, this mine will last for nearly fifty years. All the coal will be removable through one shaft. The shaft and equipment are being completed as rapidly as possible and are of the most modern and efficient type obtainable. Underground the mine will be electrically equipped and thoroughly up to date in every respect. An adequate water supply is available.

SOUND-RANGE TELEPHONES ON THE FRONT IN FRANCE

Major-General Bell Describes Success of New System
for Ascertaining the Positions of Guns
of the Enemy

Major-General J. Franklin Bell, U. S. A., who has lately returned from an inspection trip on the front in France, where he viewed the British, French and American armies, has imparted to the Senate military committee the results of his observations, among which the Washington correspondent of the *ELECTRICAL WORLD* notes the success of the new sound-range telephone system for ascertaining the positions of enemy guns. The Germans captured one of the telephones and are now also using the system. General Bell says: "Probably the success of the sound-ranging system has been greater than that of any other scientific achievement in the war." General Bell said in part:

All armies now employ scientific methods of locating guns which have never been employed in warfare before. One is known as the sound-ranging method. Briefly, they have observers scattered along a curved line which has been accurately measured, and all of these observers, of whom there are usually six, utilize electrical sound-ranging apparatus by which they report instantaneously the moment they hear the sound of a gun explosion. At a central point another electrical apparatus records these sounds from the six different stations, and by a scientific method they combine the knowledge gained from these six points and succeed in locating with a remarkable degree of accuracy the position of the gun that made the explosion when it was fired.

Each side has a type of telephone which is able to hear distinctly over very considerable distances conversations not intended for the listener, and for a long time the Allies employed this system of gaining information without the knowledge of the enemy; but the Germans captured one of these instruments and discovered that their conversations in the trenches had been listened to for quite a while and that the Allies had thus gained some information in a way which had long puzzled the Germans. New organizations had to be created in order to attend to the type of service which I have just been describing.

Transformers Mounted on Standing Timber

The construction shown herewith, while perhaps novel to distribution engineers in the thickly populated districts of the United States, is employed extensively in the Northwest lumber woods where central-station energy has to be supplied for camp needs.

Moline Plant of Tri-City Company

Since 1907 this station has hardly seen a day when some construction was not in progress. Arsenal and other government work in Rock Island, Davenport and Moline have grown to such an extent that a 200,000-kw. unit is now being installed.

FALLING OFF IN THE TOTAL OF ENGINEERING STUDENTS

Letter of President Wilson Urging Importance of
Maintaining Engineering Studies — Attendance
Off 25 to 35 per Cent

A letter from President Wilson to Dean Mortimer E. Cooley of the College of Engineering of the University of Michigan, urging the importance of maintaining the number of engineering students, is receiving extended publicity.

The letter was written as a result of resolutions prepared by a committee consisting of Dean F. L. Bishop, University of Pittsburgh; Prof. C. R. Mann, Carnegie Foundation; Prof. A. E. Kennelly, Harvard University and Massachusetts Institute of Technology, and Dean Cooley, chairman. President Wilson expressed concern at the falling off in the number of engineering students because "it is not only immediately necessary that as many students as possible should prepare themselves for engineering duties in the army and navy, but it is also of the first consequence to the country that there should be an adequate supply of engineers for the period of reconstruction which must follow the war." Parents are urged to keep their sons in the schools.

Dean Cooley, in writing to the *ELECTRICAL WORLD*, says he believes that it is a fact that the attendance in engineering since this country entered the war has fallen off from 25 to 35 per cent. Hardly a day passes without calls from the army or navy for the more advanced students. Graduating classes this year, he expects, will not be more than half their usual size.

"The average age of engineering graduates," says Dean Cooley, "is nearly twenty-three years. Thus most of the juniors and seniors are eligible to the draft. Even our freshmen and sophomores, many of them, are keen to get into the war. The Engineer Enlisted Reserve Corps and the Naval Reserve Force, now that they have been established, will no doubt keep in college many who would otherwise go."

THE MOVEMENT IN COMMODITY PRICES IN ONE HUNDRED YEARS OF WAR AND PEACE

Commodity Prices and Public Utility Rates

Historical Precedents All Indicate that the Decline in Prices from Their Present High Level Will Be Very Slow Even After Cessation of War—Rate Increases Granted Only for Its Duration Will Be Inadequate

BY WILLIAM J. HAGENAH

Mr. Hagenah presented an extended discussion on this important subject before the Wisconsin Gas and Electrical Association at Milwaukee on March 27. These excerpts from his remarks emphasize the danger of failure to readjust electric rates.

WE ARE witnessing at the present time a most important development growing out of our disturbed economic and political conditions—one which is destined to have a most far-reaching effect on the operations of public utilities. Economists have for some time foreseen and predicted the condition which is now exerting such tremendous pressure on every form of activity, individual as well as corporate and public as well as private. There is hardly an individual or an enterprise that has not already felt this staggering force or is not destined to feel it in the near future, but among all forms of industry which are struggling to effect a readjustment none has suffered so acutely as have the public utilities. I refer to the steadily rising level of prices, to which such decided impetus has been given by our entry into the great European war.

For over fifteen years before the opening of the European war we witnessed in this country a gradually increasing price level. Coincident with this was our great industrial and commercial development.

The mine owner, the manufacturer, the farmer, the tradesman and the professional man met the rising level of prices by shifting the burden through increased charges for their product or his service, but not so with the utility. Its rates were fixed and could not be increased except by action of the proper public authority. So long, however, as the utility has not yet reached the reasonable limit of its technical development and while the territory which it served was still far from saturation, these increasing costs were largely offset by improvements in apparatus and methods. In fact, there are many instances where in spite of these conditions net earnings, because of especially favorable local con-

ditions, showed annual increases. Electric production units were each year becoming larger and more efficient. The art of distribution and transmission was making great strides. The investment per unit of capacity generally tended downward. At the same time the demand for utility service was growing, and what fifteen years ago was considered a luxury in a short time became a necessity. As long as this condition was present the economies growing out of increased efficiency and service development tended to offset the rise in labor and material prices, but when relatively high efficiency had been realized and the increases in the price level appeared to be gaining in momentum, the trend of net earnings in most instances turned definitely downward. With the reasonable limit of expansion reached, the crisis in the history of the utility industry approached. Between the pressure of increasing costs and the declining purchasing power of the dollar of income net earnings were threatened with extinction. This, in brief, was the condition of the utility industry when in 1914 the storm of the European war burst on the world—a war which each year has enveloped additional peoples and has gained in fury and destructiveness. And with the coming of this war the level of prices, which was already at the highest point reached in a generation, turned abruptly and violently upward, which tendency it has maintained to this time.

COMMODITY PRICES THAT GO BACK A HUNDRED YEARS

The diagram reproduced with this article shows Sauerbeck's ten-year average index prices for the years from 1817 to 1916, on which I have superimposed the annual index prices of the London *Statist* in order to show what has taken place beyond the period covered by the Sauerbeck data and what the extension of the Sauerbeck data for the next few years will reveal.

Just as the political history of the nineteenth century dates from the Congress of Vienna and the final

defeat of Napoleon, so the economic history of that century also begins with the conditions then broadly recorded. The year 1815 is one of those years in history which marks an epoch and the influences of which time extend for many decades. In the next few years we are likely to witness another such epoch-making date, when the world, bled white by war, will close a chapter of great social and economic forces in conflict, in the soil of which mighty political movements will have taken root.

Let me call attention to the fact that from the high-price level following the Napoleonic wars to the high level of the Civil War period was approximately fifty years. Also, following the low point reached in about 1846, it was again fifty years before the low level after the civil war was reached. Singularly, it is now just fifty years since the high level of prices in the Civil War period. In view of these events of the last century, covering two complete major economic cycles, in each case growing out of conditions similar to those with which the world is confronted at this time, can it be expected that following the declaration of peace in this war we shall see a quick decline in prices to the pre-war level or lower?

PREVAILING PROSPERITY IS LARGELY FALLACIOUS

In spite of prevailing conditions, we appear very prosperous at this time, but let us not be deceived. This is a war prosperity, and both England and Germany report the same kind of business activity. However, in view of what we know of conditions, it would be more correct to say that we are extremely busy rather than extremely prosperous, since we are not creating wealth. Our country, along with almost the entire world, is just now engaged under pressure of the greatest necessity in carrying on campaigns which are exhausting the man power and wealth of the world and from which all will emerge as peoples much poorer than before they entered. From this period of intense activity, of strained production and increasing consumption, we shall enter a period after the war when this destruction must be paid for by the hard labor and economies of the people. The reaction will be as great as was the action, but it will be extended over a much longer period of time. This does not mean that we shall at once have a serious depression. On the contrary, the necessity for urgent reconstruction and the accumulation of deferred work, together with the sentimental effect of the return of peace, will lead to considerable activity for a year or more after the close of the war; but the period of readjustment and of producing from the soil and other natural resources and by hard labor the wealth to pay for these struggles will cover many years, and during this time we shall undoubtedly experience a relatively high level of prices, but with a gradually declining tendency the world over.

Not only has our supply of gold been showing expanding tendencies, but our currency legislation for a number of years has operated to increase the supply of money and credits. Our currency laws, our Federal Reserve banking system, farm loan banks and the war credit machinery all operate strongly to encourage expansion which may even lead to inflation. These conditions will exert a powerful tendency to maintain prices at a high level and will offset many other influences which would otherwise operate for a decline. It

is even possible that the government will find it to the interest of the country at large to give stability to the price movement and to prevent any violent decline.

Based on the course of the price movement after periods of great world wars in the past and in view of the special conditions with respect to the currency and banking systems at the present time, we may look forward to a considerable period of high prices, a period of business readjustment and a period of new social legislation. What this means in its full significance to individuals, to business in general, and especially to public utilities, can be readily understood without attempt on my part either to generalize or to go into details.

However, reflect on what it will mean to business to be required to make extensions and to finance requirements on this level of prices while operating under a rate schedule determined five years ago if we should not return for fifteen or twenty years to the price level on which such rate schedule was based. What will it mean to business to have to purchase operating supplies on the price level of five years ago? The price level under which plants were built, under which franchise obligations were established and on which rate schedules were established may not again be reached in fifteen years or even longer. There are some who say that prices will decline quickly with the return of peace. Whether they will or not no one definitely knows, but when we stop to consider the extent and destructiveness of this world-wide war and remember the price movement after each of the other two great wars, it is not difficult to believe that many men in this room will not live to see the return to the price level of 1914.

As a result of this violent price movement which we are now witnessing the work of the utility commissions has not only been enormously increased but the character of their decisions reflects the really constructive purpose of such institutions. During the decade of commission activity extending from 1907 to 1917 the almost universal results of commission investigations were reductions in rates. For the larger part of this period the rise in prices was gradual but extremely moderate in comparison with the last two years; but these increases were in many instances offset by the increased efficiency in utility operations and the great extension in service. So elastic was the industry and so quick its response to reasonable rate reduction that these years, which represent an almost unbroken record of rate reductions, at the same time mark the golden years of utility growth—years during which public utilities reached a point of growth in size and stability comparing favorably with the greatest industries of history.

At the present time, however, the commissions, which were quick to take advantage for the public of every economy in operation or profit resulting from improvements, are now foremost in granting relief from the pressure of high prices. Nearly five hundred public utilities have received increases in rates or have been relieved from burdensome obligations by state utility commissions and by city councils within the last fifteen months, and among this number are companies operating in many of the large centers of population. If the present tendency among state commissions and city councils to permit increases in rates to offset rising costs continues, the year 1918 will witness a practical

cancellation of much of the work for rate reduction accomplished by these same authorities after many years of labor. It will also show that the original conception of a public utility commission as a continuing investigating body created to do justice to investor and public alike was correct, and that even in the midst of this great war, wherein every element of our national life is strained to the utmost, the desire for justice and fair play to all interests is still firmly grounded in the heart and mind of the great American public.

Standing out among the problems now before these commissions and growing out of the rapid increase in commodity prices are two facts which should be developed and properly presented to the regulatory authorities, the justice and necessity of which are apparent from a study of the price movement. These are, first, the necessity of departing from the use of the five-year and ten-year average prices as a basis for rate-making appraisals and, secondly, the necessity for a larger return on the fair value of the property.

Zone System for Bituminous Coal

Change in the Plan of Distribution Made by the Fuel Administration with the Intent of
Reducing the Burden on the Railroads, Facilitating Shipment of Fuel and
Keeping All Mines Working at Their Full Capacity

IN ORDER to reduce the burden on the railroads by the elimination of cross-hauling and the curtailment of railroad equipment in unnecessarily long hauls, the United States Fuel Administration in conjunction with the Director General of Railroads has devised a zone system for the control of bituminous-coal distribution for the year beginning April 1, 1918. Hereafter no cars or locomotives will be engaged in delivering coal to distant regions that can be served far more quickly from fields near by.

As shown by the map accompanying this article, the country is divided into a number of zones each of which will be supplied with coal from mines relatively near, thereby preventing abnormal and wasteful transportation movements and insuring more equal distribution of cars to the mines and more steady employment of mine labor. For example, Pocahontas coal will no longer find its way to Chicago and other Illinois points, but these latter will be compelled to substitute coal which can be obtained from Illinois mines with half as long a haul. Obviously, where the fuels possess different characteristics changes in boiler settings and methods of firing may have to be made. It is the hope of the Fuel Administrator, however, that unavoidable inconveniences will be borne gladly in view of the fact that the readjustment of the distribution of coal is made for the welfare of the nation.

The zone system does not affect bituminous coal for railroads, bituminous coal for movement on inland waterways or coal delivered to Canada. Moreover, there are certain exceptions to the conditions imposed. Where certain industries require coal of particular quality or characteristics, if that coal is not obtainable from the district in which the plant is situated, permits will be granted to bring in the fuel from other districts.

The zones are clearly indicated on the accompanying map and are marked with a key number. Definite boundaries are fixed for the zones such as state lines or railroad lines. A complete list of all the zones shown in the map is given in the key, which also enumerates the districts from which coal may be obtained. If, for instance, a consumer wishes to ascertain what coals are available for his use, he locates on the map the zone in which his plant is situated and notes its number. Under that zone number in the "Key

to Consuming Zones" is given the list of producing districts from which coal can be had. A wall map of large size showing the same zoning in fuller detail may be obtained from the Coal Zone Map Company, Glen Echo, Md.

KEY TO CONSUMING ZONES

Zone Number	Restricted to Coals Indicated
1	North Dakota, South Dakota, docks.
2	Illinois (summer only), docks, North Dakota, South Dakota, Iowa, (to points in Iowa only).
3	Illinois, Kentucky (Western), Indiana, docks.
4	Illinois, Kentucky (Western), docks.
4A	Illinois, docks.
5	Iowa, Kansas, Illinois, Missouri, Oklahoma, Arkansas.
6	Illinois, Kentucky (Western).
6A	Illinois, Kentucky (Western), docks.
7	Illinois, Iowa (to points in Iowa only).
8	Illinois, Indiana.
9	Illinois, Indiana, Kentucky (Western).
10	Indiana, Illinois (Danville district on Wabash Ry. only), Kentucky (Western, to Jeffersonville and New Albany only).
11	Virginia (L. & N. R. R.), Tennessee (M. R. R.), West Virginia (Southern), Illinois, Indiana, Kentucky (Eastern and Western).
12	Indiana, Illinois (Danville district on Wabash Ry. only).
13	Kentucky (Western).
14	Indiana, Kentucky (Eastern), West Virginia (Northern and Southern), Virginia (L. & N.), Tennessee (M. R. R.), Michigan, Ohio (on G. R. & I. Ry. only).
15	Illinois, Indiana, Kentucky (Eastern and Western), West Virginia (Northern and Southern), Virginia (L. & N.), Tennessee (M. R. R.), Michigan.
16	Indiana, Illinois (Danville district on Wabash Ry. only), Kentucky (Eastern), West Virginia (Southern).
17	Virginia (L. & N. R. R.), Kentucky (Eastern), Tennessee (M. R. R.), West Virginia (Southern).
18	Virginia (L. & N. R. R.), Kentucky (Southern), Tennessee (M. R. R.).
19	Kentucky (Eastern), Tennessee (M. R. R.), West Virginia (Southern, also Eastern, to points on C. & O. Ry. from Catlettsburg, Ky., to Cincinnati, Ohio).
20	Virginia (L. & N. R. R.), Kentucky (Eastern), Tennessee (M. R. R.), West Virginia (Northern and Southern), Indiana, Illinois (Danville district on Wabash Ry. to points in Indiana only), Ohio, Michigan.
21	Virginia (L. & N. R. R.), Kentucky (Eastern), Tennessee (M. R. R.), West Virginia (Northern and Southern), Ohio, Michigan.
22	Virginia (L. & N. R. R.), Kentucky (Eastern), Tennessee (M. R. R.), West Virginia (Southern), Ohio.

KEY TO CONSUMING ZONES (Continued)

Zone Number	Restricted to Ccals Indicated
23	Kentucky (Northeastern), West Virginia (Northern and Southern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio), Ohio.
24	Kentucky (Northeastern), West Virginia (Southern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio), Ohio.
25	West Virginia (Northern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio), Ohio.
26	Ohio.
27	Pennsylvania, Ohio.
28	No change contemplated in this plant except that low-volatile coal in the Pocahontas, Tug River and New River districts on the N. & W. R. R. and the C. & O. Ry. and the Virginian Ry., and Clinch Valley districts in Tazewell and eastern Russell Counties along the N. & W. R. R., also high-volatile east of Charleston, W. Va., on C. & O. Ry. and east of Iaeger, W. Va., on N. & W. R. R., will be restricted to the District of Columbia (except C. & O. Ry.), Virginia (including tide-water terminals), also points in West Virginia on the direct line of the C. & O. Ry. and N. & W. R. R. east and west bound and Virginia Ry. east bound.
29	Ohio, West Virginia (Northern, also Eastern, to points on the direct lines of the C. & O. Ry. and N. & W. Ry.).
30	No change.
31	North Dakota, Wyoming, Montana and other fields east of the Rocky Mountains, docks.
32	North Dakota, South Dakota, Wyoming, Montana, docks.
33	South Dakota, Wyoming, Montana and other fields east of the Rocky Mountains, North Dakota, docks.
34	North Dakota, South Dakota, Wyoming, Montana, Illinois (summer), docks.
35	Iowa, Kansas, Missouri, Arkansas, Oklahoma, Colorado and other fields east of the Rocky Mountains, Wyoming.
36	Kansas, Missouri, Iowa, Arkansas, Oklahoma, Colorado (Southern).
37	Oklahoma, Missouri, Arkansas, Kansas, Colorado, New Mexico, Texas.
38	New Mexico, Colorado, Texas.
39	Colorado, New Mexico, Arkansas, Oklahoma, Texas.
40	Kentucky (Western), Alabama, Texas.
41	Arkansas, Illinois (summer), Iowa, Kansas, Missouri, Oklahoma, docks.
42	Arkansas, Iowa, Kansas, Missouri, Oklahoma.
43	Iowa, Arkansas, Kansas, Missouri, Oklahoma.
44	Arkansas, Illinois, Kansas, Missouri, Oklahoma, Texas.
45	Alabama, Arkansas, Illinois (only on lines of St. L. S. W. Ry. and St. L., I. M. & S. Ry.), Kansas, Missouri, Oklahoma, Kentucky (Western), Texas.
46	Alabama, Arkansas, Illinois (only on lines of St. L. S. W. Ry. and St. L., I. M. & S. Ry.), Kentucky (Western), Texas.
47	Kentucky (Western).
48	Alabama.
49	Alabama, Kentucky (Western).
50	Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise and western Russell Counties of Virginia), Kentucky (Western), Tennessee, Georgia.
51	Alabama, Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise and western Russell Counties of Virginia), Tennessee, Georgia.
52	Alabama.
53	Kentucky (Southern, also Western, to points on N., C. & St. L. and T. C. R. R., Nashville to Old Hickory and Hermitage, Tenn., inclusive), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia, also Clinch Valley district in eastern Russell and Tazewell Counties), West Virginia (Eastern, also Southern, on C. & O. Ry. east of Charleston and N. & W. Ry. east of Iaeger, W. Va.), Georgia, Tennessee.
54	Kentucky (Southern), Tennessee, Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise and western Russell Counties of Virginia), Alabama, Georgia.
55	Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise and western Russell Counties of Virginia), Tennessee, Georgia, West Virginia (Eastern).
56	Kentucky (Southern), Tennessee, Virginia (all Black Mountain and Stonega Districts in Lee, Dickenson, Wise and western Russell Counties of Virginia, and Clinch Valley districts in Tazewell and eastern Russell Counties along the N. & W. Ry.), West Virginia (Eastern, on C. & O. Ry. and N. & W. Ry. and Virginian Ry.).
57	No change contemplated. Coal to be supplied generally from low-volatile fields.

EXPLANATION OF TERMS USED

Summer.....	From April 1 to and including Sept. 30.
Winter.....	From Oct. 1 to and including March 31.
KENTUCKY	
Eastern.....	All mines in eastern Kentucky on Sou. Ry. (Q. & C.), L. & N., C. & O., N. & W. and L. F.
Northeastern.....	Sandy Valley & Elkhorn Ry., L. F., C. & O. and N. & W. in Thacker, Big Sandy and Elkhorn districts.
Northern.....	L. & N. in Hazard and Elkhorn districts.
Southern.....	Sou. Ry. (Q. & C.) and L. & N. in Harlan, Jellico and Southern Appalachian districts.
Western.....	L. & N. and I. C. west of Louisville, Ky.
WEST VIRGINIA	
Eastern.....	C. & O. and N. & W. in low-volatile fields of Pocahontas, Tug River and New River districts.
Northern.....	K. & M., K. & W. V. and C. & C. west of Dundon.
Southern.....	C. & O. and N. & W. in Kanawha, Kenova and Thacker districts.

Sudden Short Circuits of Alternators

Thorough and Critical Exposition of Electromagnetic Phenomena Attending Sudden Short Circuits of Alternators in the Light of Recent Experimental Results—
Practical Methods of Calculating Characteristics

BY N. S. DIAMANT, RICE INSTITUTE, HOUSTON, TEX.

IN THIS article it is proposed to give a thorough, complete and the simplest possible exposition of the electromagnetic actions which take place when an alternator, or a system connected to it, is suddenly short-circuited. At the outset the author does not hesitate to state that the article is non-mathematical. However, it must be conceded that in engineering the most useful and practical knowledge is the quantitative knowledge; thus an attempt will be made to serve the

FIG. 1—ATTENUATION OF FIELD FLUX

majority who may desire only qualitative information without neglecting the minority who can use only quantitative knowledge.

It is apparently the opinion of some engineers that "an exact solution of the problem seems quite impossible," or that "it is well nigh impossible to estimate with a reasonable degree of accuracy the rate of decay of the current."¹ However, the writer is inclined to believe that with a thorough and clear understanding of the electromagnetic phenomena involved in the sudden short-circuit² of alternators, and through the proper interpretation and check of the theories proposed, it will be possible to solve and answer many practical problems and questions.

ANALYSIS OF THE ELECTROMAGNETIC PHENOMENA

To establish a concrete basis from which to work consider an n -phase, non-salient pole alternator operating light at full speed and normal excitation. Before the occurrence of a sudden short circuit the field mmf., acting alone, produces a certain flux $\Phi_{normal} = \Phi_n$ which links with the armature. If the machine is suddenly short-circuited, there is a great rush of current which sets up enormous stresses varying as the square of the current. This is followed (in about one or two to seven seconds in case of turbo-alternators without and with external reactors) by the "steady" condition of sustained short circuit,³ in which the strong demagnetizing armature currents combine with the field mmf. to produce the resultant flux, $\Phi_{ssc} = \Phi_{sustained\ sh\ circ}$. It is well known that Φ_{ssc} is a small fraction of Φ_n ; thus the flux in the machine, somehow or other, dies

down from Φ_n to Φ_{ssc} . E. J. Berg, to whom this theory is due, assumes that the flux decays according to the attenuation factor of the field in the manner indicated in Fig. 1.

Under sustained short-circuit or normal operation the armature conductors cutting the constant fluxes Φ_{ssc} and Φ_n produce an alternating emf., say sinusoidal in shape as indicated in Figs. 2a and 2b, where the maximum values E_{ssc} and E_i are proportional to Φ_{ssc} and Φ_n respectively. The transient or decaying flux which lasts during the interval ab (Fig. 1) produces an emf. as illustrated in Fig. 2c, where E_i is proportional to $(\Phi_n - \Phi_{ssc})$, and the rate of decay is assumed to depend upon α_f , the attenuation factor of the field.

Knowing the quantitative expressions for the emf. acting under sudden short circuit and the sustained short circuit, it is a simple matter to find the current due to them. According to Kirchhoff's second law, the sum of the emfs. e_i and e_{ssc} (see Fig. 2, page 1029) is equal at every instant to the sum of the armature resistance and reactance drops. The equivalent mathematical expression which involves r_a and x_a , the armature resistance and reactance per phase, and also z_a and α_f reduces to

$$i_a = I_{ssc} \left[\left(k \frac{X}{Z} \right) e^{-\alpha_f(\theta - \theta_1)} \sin(\theta - \beta) + \sin(\theta - \beta_1) \right] - e^{-\alpha_a(\theta - \theta_1)} \times \left\{ k \frac{X}{Z} \cdot \sin(\theta_1 - \beta) + \sin(\theta_1 - \beta_1) \right\} \quad (1)$$

Where I_{ssc} = the ssc, armature current = (E_{ssc}/z_a) ; $(E_i/z_a) = (kE_{ssc}/x_a)$; or $E_i = kE_{ssc}$; $z_a = \sqrt{r_a^2 + x_a^2}$ = armature impedance; $\alpha_a = (r_a/x_a)$ = armature attenuation factor; $R/X = (\alpha_a - \alpha_f)$. $Z = \sqrt{R^2 + X^2}$; $\beta = \tan^{-1}(X/R)$; $\beta_1 = \tan^{-1}(x_a/r_a)$. Equation (1) may be simplified by assuming $\beta = \beta_1 = 90$ deg.⁴ Until it is known exactly what these quantities stand for and what the assumptions involved are, however, mathematics will only shield ignorance. Considering the complexity of the subject, however, it will be best, before taking up its physical interpretation, to look at the problem from another viewpoint based on the excellent work of P. Boucherot.⁵

THREE-PHASE SUDDEN SHORT CIRCUITS

Consider one of the phases of a three-phase alternator and suppose that phase No. 1 is at the position indicated in Fig. 3, when the three phases are suddenly and simultaneously short-circuited. Assuming a sinu-

⁵*Transactions International Electrical Congress*, 1911, Turin, Italy; also, *Bulletin Société Internationale des Electriciens*, Paris, December, 1911.

soidal flux distribution, the flux inclosed by phase No. 1 at the instant of the short circuit will be:

$$N_a \Phi_a \sin \omega t_1 = N_a \Phi_a \sin \theta_1$$

where $N_a \Phi_a$ = maximum flux inclosed by the N_a turns of any given phase. The flux inclosed by phase No. 2 at the instant of the sudden short circuit will be $N_a \Phi_a \sin(\theta_1 + 2\pi/3)$, and similarly for the third phase.

As is well known, the flux inclosed by any given phase under sustained short circuit is a very small fraction of $N_a \Phi_a$. Therefore, if it is assumed* that the sustained short-circuit armature reaction (a) is wholly demagnetizing (b) and sinusoidally distributed like the field flux, and that (c) the armature resistance drop is negligible compared to the reactance drop; then a little consideration will show that the armature flux under sustained short circuit will be zero. Thus the flux linking with phase No. 1 is $N_a \Phi_a \sin \theta_1$, at the instant of the sudden short circuit when $t = t_1$; it is reduced to zero at the end of the short circuit when $t = \infty$, and it is $(N_a \Phi_a \sin \omega t) e^{-\alpha_a(t-t_1)}$ at any time t during the interval of sudden short circuit, α_a being the attenuation factor of the armature. Under normal or transient conditions the flux linking phase No. 1 is equal at every instant to the mutually inductive flux coming from the field plus the self-inductive flux of phase No. 1 itself. The corresponding condition holds true for the other phases.

The field flux, which is $N_f \Phi_f$ under normal conditions, dies down to Φ_{fssc} at the end of the sudden short circuit or at the beginning of the sustained short cir-

FIGS. 2a, 2b AND 2c—EMFS. PRODUCED BY CONDUCTORS CUTTING Φ_{ssc} , Φ_n AND $(\Phi_n - \Phi_{ssc})$

cuit; at any time after the sudden short circuit it is equal to

$$\Phi_f = \Phi_{fssc} + (\Phi_f - \Phi_{fssc}) e^{-\alpha_f(t-t_1)}$$

where α_f is the attenuation factor of the field. Under normal or transient conditions this flux is equal at every instant to the mutually inductive flux coming from the three phases plus the self-inductive flux of the field itself.

Having the fundamental sudden short-circuit equations, the next step is to solve them for the field and

armature currents. The procedure followed by Boucherot (see footnote 5) is rather long and involves some almost "formidable mathematics." He obtains approximate theoretical expressions (Table I) for the damping factors α_f and α_a in terms of L_a , λ_a , L_f and λ_f (L is self-inductance and λ leakage inductance), for single-phase and two-phase short circuits, when the machine is equipped with perfect or ideal amortisseur windings and when it is not. Substituting in these the experimental values of L_a , λ_a , L_f and λ_f given in Table II, columns 4 and 5 are obtained. From these it is seen that the theoretical effect of amortisseur windings is to increase the damping factor of the armature about 33 per cent and that of the field about 16 per cent. This, of course, is very beneficial, especially from the point of view of the circuit-opening devices.

Interesting as these results may be, it seems to the writer that it is well at present not to rely too much on these theoretical or ideal results. This attitude seems justifiable in the light of some extensive sudden-short-circuit tests made several years ago by C. M. Davis⁷, which indicate that the "amortisseur winding has little or no influence." However, it may be added here that the experience of some operating companies seems to be contrary to this.

If instead of getting α_f and α_a mathematically, they are obtained experimentally by means of the rise of direct current⁸ in the armature and field respectively or by some other method⁹, expressions can be readily obtained for the transient armature and field currents. The sudden-short-circuit field current of a three-phase alternator is given by

$$i_f = I_f [1 + D e^{-\alpha_f(\theta - \theta_1)} - D e^{-\alpha_a(\theta - \theta_1)} \cos(\theta - \theta_1)] \quad (2)$$

where I_f = permanent field current, i_f = transient field current, $\theta = \omega t$, $D = (L_f - \lambda_f) / \lambda_f$, $\lambda_f = (L_a - \lambda_a) / \lambda_a$; α_a and α_f are the attenuation factors of the armature and the field. The armature current for phase No. 1 is:

$$i_a = I_{ssc} \left[(\cos \theta_1) \left(1 + \frac{D}{2} \right) e^{-\alpha_a(\theta - \theta_1)} - \cos \theta - \left(D \cos \theta \right) e^{-\alpha_f(\theta - \theta_1)} + \frac{D}{2} \left(\cos(2\theta - \theta_1) \right) e^{-\alpha_a(\theta - \theta_1)} \right] \quad (3)$$

and the currents i_2 and i_3 for the other phases are similar except that instead of $(\theta$ and $\theta_1)$ the expressions $(\theta - 2\pi/3)$, $(\theta_1 - 2\pi/3)$, $(\theta - 4\pi/3)$ and $(\theta_1 - 4\pi/3)$ are used respectively.

CRITICAL ANALYSIS OF THE EQUATIONS

In framing the theory of sudden short circuit and deriving quantitative expressions for the field and armature currents certain assumptions have been made or, strictly speaking, an ideal alternator has been considered having sinusoidal flux distributions, constant resistances, reactances, etc. However, all these equations and definitions of r_a , λ_a , α_a , etc., apply to ordinary commercial machines, in so far as they approximate the ideal machine for which all the theories in general are made. Thus it should be clear that the resistances r_a and r_a are not the ohmic or direct-current resistances

* (a) assumes the angle $\psi = 90$ deg. Assumptions (a) and (c) are ordinarily quite permissible, but the second assumption as to the distribution of armature reaction is very far from being true according to extensive investigations some of the results of which will be presented shortly before the A. I. E. E. Still, (b) may be taken as a permissible assumption, as far as theory is concerned, in order to simplify matters.

⁷General Electric Review, August, 1914, p. 816.

⁸See Transactions A. I. E. E., Vol. 31, 1915, p. 2211, Section II.

⁹See Transactions A. I. E. E., Vol. 31, p. 2260, and p. 2266, Sections IV and VII. See also second installment of this article.

of the field and armature conductors, but they are the alternating-current resistances corresponding to the actual non-uniform flux distribution under short-circuit conditions. Furthermore, it may be easily seen that the different quantities r , L , λ , etc., are and have to be assumed as constant, though actually they are neither constant nor is the law according to which they

FIG. 3—CONDITION ASSUMED FOR DISCUSSION STARTED AT BOTTOM OF PAGE 1028

vary usually known. It is fortunate, however, that, as experience indicates, satisfactory results can be obtained by using certain average values or by introducing certain empirical or semi-empirical factors.¹⁰

The extent to which the preceding theory can be applied to actual machines may be answered qualitatively as follows: Consider, for example, the damping factor of the field, $\alpha_f = r_f/x_f$; here r_f is not the direct-current resistance of the field spools but it includes any eddy-current or energy-consuming effects which help to damp out the field transients. Furthermore, as just stated, the reactances and even the resistances involved in (2), (3), etc., do not remain invariable during the short circuit. In fact, the writer has noticed that the damping factors are considerably and consistently¹¹ larger during the first cycle or so of the sudden short circuit than toward the end of it. This is especially true of α_f , which has high values at first and then remains constant for the rest of the sudden short circuit. For example,¹² in case of a 700-kva., 4000-volt, 60-cycle machine the following values were obtained from a sudden-short-circuit oscillogram:

$$\begin{aligned} \epsilon^{2\pi\alpha_f} &= 1.127, \text{ or } \alpha_f = 0.019 \text{ for first two cycles.} \\ \epsilon^{2\pi\alpha_f} &= 1.039, \text{ or } \alpha_f = 0.0061 \text{ for succeeding five cycles.} \\ \epsilon^{2\pi\alpha_f} &= 1.065, \text{ or } \alpha_f = 0.10 \text{ mean for all seven cycles.} \end{aligned}$$

Similarly,

$$\begin{aligned} \epsilon^{2\pi\alpha_a} &= 1.426, \text{ or } \alpha_a = 0.0564 \text{ for first two cycles.} \\ \epsilon^{2\pi\alpha_a} &= 1.575, \text{ or } \alpha_a = 0.0722 \text{ for succeeding five cycles.} \\ \epsilon^{2\pi\alpha_a} &= 1.532, \text{ or } \alpha_a = 0.0677 \text{ mean for all seven cycles.} \end{aligned}$$

A quantitative answer, however, to the question is extremely difficult, since so much depends upon the flux distribution, the flux oscillations and the eddy-current paths in the pole faces, the armature teeth, etc. Furthermore, a great deal depends upon the design and construction details of a given machine or a given type of machine. For example, it is conceded that the sudden short circuit of large turbo-alternators having a cylindrical field of two or four poles is very much more serious than that of salient-pole alternators. However, the writer knows of cases where salient-pole alternators with a comparatively large number of poles had a ratio of sudden-short-circuit current to full-load current 20 to 40 per cent higher than large turbo-gen-

erators five to ten times the kva. rating of the salient-pole machines. Fortunately, here, as in many engineering problems, a definite quantitative answer is not necessary, and it is safe to state that at present, guided by the rational theories developed above, the sudden-short-circuit characteristics of a machine or a system can be calculated with the accuracy required in ordinary practice, in most cases and for most problems, without subjecting the machine to unreasonably dangerous or expensive tests.

PHYSICAL INTERPRETATION¹³ OF SUDDEN-SHORT-CIRCUIT PHENOMENA

This has really, explicitly or implicitly, been given in the foregoing quantitative exposition. Still, it may be well to consider further some of the physical aspects of the subject, which is admittedly very complex. To begin with, it is known that:

(a) The comparatively large flux existing under normal operating conditions is reduced to practically zero under sustained short circuit.

(b) The rate of decay in mutually inductive circuits depends upon the total or equivalent leakage inductance and not the inductance L .¹⁴

(c) The fundamental fact true of any electromagnetic circuit, that any change of the flux inclosed by a circuit gives rise to, and is equal to, a quantity of electricity q times the total resistance of the circuit.¹⁵

Upon these fundamentals are based the most important interactions between the armature and field during sudden short circuit. In Fig. 4, Q_{adc} represents the quantity of electricity due to the change of flux in the phase under consideration. This quantity gives rise to i_{adc} in the armature, and it is clear that its value depends upon the amount of flux inclosed by the phase at the instant of sudden short circuit; i.e., $Q_{adc} = (N_a \Phi_a \sin \theta_1) / r_a$. It is a maximum when $\theta_1 = 90$ deg. or when the emf. wave is zero, and it is zero when

FIGS. 4a AND 4b—QUANTITY OF ELECTRICITY DUE TO CHANGE OF FLUX IN ARMATURE AND FIELD CIRCUITS

¹³See footnote, page 11.

¹⁴Throughout this article the definitions of L , λ and M given before are strictly adhered to.

¹⁵A method based on this principle is used to determine the apparent resistance of a ballistic galvanometer on closed circuit. The method consists in connecting the galvanometer to a secondary whose primary is supplied with direct current. From the deflections of the galvanometer for different resistances of the secondary the apparent resistance of the instrument can be calculated, or if desired the mutual inductance of the two circuits may also be obtained.

¹⁰These remarks apply to standard theories of all alternating-current or direct-current machines.

¹¹See *Transactions A. I. E. E.*, Vol. 34, 1915, p. 2266, where attention was called to this.

¹²Based on data given in *General Electric Review*, February, 1917, p. 125, Table I. The method of calculation of α_a and α_f is described later in this article.

$\theta_1 = 0$ or the emf. is maximum. Similarly $Q_{fde} = (\Phi_f - \Phi_{fssc})/r_f$ is due to the change of flux in the field and gives rise to i_{fde} (in the field). This, of course, is independent of θ_1 or the point of the emf. wave at which the short circuit occurs.

Referring to the equations, it will be found that in case of the armature current:

The first term in (3) and the third term in (1) represent i_{adc} of Fig. 4a, and according to either term

TABLE I—THEORETICAL ATTENUATION FACTORS WITH VALUES FROM TABLE II SUBSTITUTED TO GIVE COLUMNS 4 AND 5

Kind of Sudden Short Circuit	THEORETICAL ATTENUATION FACTORS DERIVED MATHEMATICALLY		Column 2 in per Cent of (r_f/L_f)	Column 3 in per Cent of (r_a/L_a)	Field Equipped or Not with Perfect Amortisseur
	a_f of the Field	a_a of the Armature	Based on Experimental Results Given in Table II		
(1)	(2)	(3)	(4)	(5)	(6)
Two-phase..	$\left(\frac{r_f}{\lambda}\right)^*$	$\frac{r_a}{L_a}\left(\frac{D}{2}+1\right)^{**}$	$3.04\left(\frac{r_f}{L_f}\right)$	$1.50\left(\frac{r_a}{L_a}\right)$	Not equipped
Two-phase..	$\left(\frac{r_f}{\lambda_f}\right)$	$\left(\frac{r_a}{\lambda_a}\right)$	$3.04\left(\frac{r_f}{L_f}\right)$	$2.01\left(\frac{r_a}{L_a}\right)$	Equipped
Single-phase.	$\frac{r_f}{\sqrt{L_f \lambda_f}}$	$\frac{r_a}{\sqrt{L_a \lambda_a}}$	$1.74\left(\frac{r_f}{L_f}\right)$	$1.41\left(\frac{r_a}{L_a}\right)$	Not equipped
Single-phase.	$\frac{r_f}{L_f}\left(\frac{D}{2}+1\right)^{**}$	$\frac{r_a}{\lambda_a}$	$2.02\left(\frac{r_f}{L_f}\right)$	$2.01\left(\frac{r_a}{L_a}\right)$	Equipped

* λ = Leakage inductance. ** $D = (L_f - \lambda_f)/\lambda_f = (L_a - \lambda_a)/\lambda_a$.

i_{adc} is a decaying direct current and is a function of θ_1 as just explained.

The second term in (3) and the second term in (1) represent the sustained short-circuit armature current due to Φ_{fssc} , Fig. 2a.

The third term in (3) and the first term in (1) represent the decaying alternating current due to i_{fde} induced in the field, Fig. 4b.

In the case of the field current:

The first term in (2) represents the steady direct-current exciting current.

The second term in (2) represents i_{fde} of Fig. 4b, due to the change of flux in the field.

The third term in (2) represents an alternating decaying current induced in the field by the decaying direct current i_{adc} in the armature (see Fig. 4a).

There is a fourth term in (3) which represents a double frequency current in the armature decaying according to α_a . A little consideration will show that this is due to the alternating current in the field, which is of fundamental frequency and decays according to α_a , as indicated by the third term of (2). If all the interactions between the field and armature were to be taken into account, it would be found that:

1. The direct-current decaying current in the armature represented by Fig. 4a and third term of equation (1) or first term of (3) produces an alternating current of fundamental frequency in the field, represented by the third term of (2).

2. This decaying alternating current in the field induces a double-frequency decaying current in the armature as represented by the fourth term of (3).

3. The decaying double-frequency current in the armature produces a triple-frequency decaying alternating current in the field, etc.

Hence there may be the second, fourth, sixth, etc., even harmonics in the armature and the first, third, fifth, etc., odd harmonics in the field, all decaying according to the armature damping factor α_a . Besides the above harmonics, due to i_{adc} , it can be shown that unbalanced three-phase currents in case of an unbalanced sudden short circuit or balanced three-phase odd harmonics of the armature current will produce armature reactions of double, quadruple, sextuple, etc., fre-

quency, which in turn will produce emfs. and currents of third, fifth, seventh, etc., frequency in the armature. However, experience shows that in most practical cases the higher harmonics in the field and armature may without important consequence be neglected.¹⁶

Wireless Signal Lamp for War Work

Engineers of the National Lamp Works of the General Electric Company, working in conjunction with experts from the federal ordnance department, have developed a wireless signal lamp for airplane service and other war work. It can be flashed at a great distance by means of energy transmitted to it through wireless extensions now in use. The advantage of this lamp is in the elimination of wires which can be cut or tampered with by the enemy. It can be used between stations on the ground at the battle front or between ground stations and airplanes flying over the enemy's territory. To John Randall, advisory head of the lamp department at Nela Park, credit is given for the development of the lamp. He has spent years in experimental work with lamps.

It is stated that an absorbent gas for use in fighting poisonous gases thrown by the enemy is being perfected at Nela Park.

¹⁶See also the ELECTRICAL WORLD, Dec. 29, 1917, p. 1251, where by means of curves and oscillograms the interactions between field and armature are illustrated and their combined effect in producing the complex transient field and armature currents is explained qualitatively or non-mathematically.

Experience with Powdered Coal

Fuel in This Form Considered Especially Desirable as Low-Grade Coal Can Be Burned at High Efficiency—Method of Preparing and Burning Fuel—Results of Tests

BY A. E. MACINNIS

WITH the experience of the past winter in mind and the possibility of a worse fuel scarcity and the new problems imposed by the recent order of the Fuel Administration regarding zone distribution ahead, every coal-consuming plant will do well to ascertain what methods are being employed to burn coal more economically, especially the lower grades. Experience in the Northwest may shed some light on the subject, and for this reason a brief account of the situation there and of what is being done to improve it will be given in this article.

More than a year ago the price of fuel oil began to advance rapidly, and there was a prospect that crude oil might be withdrawn from the market. This caused an increased demand for coal, which threatened to overtax the mine and transportation facilities. Three possible ways of meeting this situation were considered—first, utilizing grades and kinds of coal previously wasted; second, securing higher efficiency from the coal burned; third, substituting wood to make up the shortage.

One of the first men in the Northwest to attempt the solution of the fuel problem was W. J. Santmyer, advisory engineer and superintendent of steam heat for the Puget Sound Traction, Light & Power Company, Seattle. From previous experiments he was inclined to favor pulverized coal, as by its use low grades of coal can be burned at relatively high efficiency. In theory this form of combustion is ideal since it provides an intimate, even and thorough mixture of coal and air, which allows complete combustion with a minimum of excess air. On Mr. Santmyer's recommendation the company conducted a series of experiments* with powdered coal in a 300-hp. Babcock & Wilcox boiler which lasted from February to June. The results obtained were so favorable that the company authorized the erection of a complete pulverized coal plant for ten boilers, aggregating 4100 boiler-hp. This installation is now in progress, but before describing the new plant a résumé of the experiments will be given.

PREPARATION OF THE COAL

The powdered coal was prepared at the briquetting plant of the Pacific Coast Coal Company, about 12 miles (19.3 km.) from Seattle. This plant is in continual operation, its boilers and driers being fired with its own pulverized coal. The preparation process is as follows: If not already to size, the coal is crushed to $\frac{3}{4}$ in. (19 mm.) and then fed into a Ruggles drier, which consists of two nearly horizontal steel cylinders, one within the other. The furnace is installed at the higher end, and the hot gases pass through the inner cylinder to the lower end and then back between the two shells in contact with the coal. Both cylinders rotate slowly so that the coal is continually agitated as it passes down to the

lower end of the drier. Drying of the coal is necessary to prevent cohesion of the particles which would interfere with pulverization. The degree of drying necessary varies according to the form in which the moisture occurs in the coal, ranging from 1 to 6 per cent.

The grinding is done in a Raymond mill. The degree of fineness necessary is that which will allow complete combustion while the fuel is still suspended. With lignites having a high volatile content and ash with a high fusing point coarser pulverization is permissible than with coals having a greater proportion of fixed carbon. With the local coal available the best results are obtained when 95 per cent will pass through a 100-mesh screen and 85 per cent through a 200-mesh screen.

The powdered coal was transported to Seattle in a

APPARATUS THROUGH WHICH POWDERED COAL IS DISCHARGED INTO FURNACE

box car equipped with a metal-lined hopper, so as to be air-tight and prevent the absorption of moisture. From this it was discharged into an inclosed conveyor which elevated and dumped it into the bunker. The coal was fed into the boiler supply pipes by two motor-driven screws and conveyed about 30 ft. (9.1 m.) horizontally to the boiler front by compressed air.

As it is imperative that there be sufficient space in the furnace for complete combustion to take place without contact with the boiler tubes and to avoid damage to the brickwork due to the blasting effect of the flame, an extended or "Dutch" oven was built out about 5 ft. (1.5 m.) in front of the boiler. After considerable experimenting Mr. Santmyer devised a burner and feeder that gave a thorough mixture of coal and air and just the discharge velocity to keep the fuel suspended until completely burned.

It was found that certain coals would slag at com-

*See ELECTRICAL WORLD, June 9, 1917, p. 1105.

paratively low temperatures, but by constructing a slag pit underneath the furnace with sides sloping sharply away from the top opening it was found that the slag would drop off in small chunks which could be readily removed through a clean-out door.

Boiler trial records were kept of fifteen test runs made with many different kinds of coal, among which

*Under water for several years.

were South Prairie, Black Diamond, Renton, including sludge, which in raw state analyzed over 21 per cent ash and 30 per cent moisture; Tono, which runs only about 8000 B.t.u.'s per pound; Newcastle screenings, which had lain for years under water in Lake Washington; Mendota; Nanaimo (B. C.) slack; and coal from Rock Creek, Cal. The results of some representative tests are given in Table I.

The experiments indicated the following advantages for pulverized coal:

Different kinds and grades of coal can be prepared,

pendable. It is smokeless, even under heavy overload. It is remarkably flexible, it having been possible to force the 300-hp. boiler to 600 boiler-hp. in a few minutes without injury to the heating surface or brick-work.

The increased capacity of boilers means less investment and hence a saving through lower fixed charges additional to that due to greater efficiency.

Because of these advantages the company decided to change its Western Avenue station to a powdered-coal plant. Before describing this installation, the writer wishes to impress on the reader that it is not being pointed out as necessarily the best installation. To his knowledge, however, it is the *first* large stationary boiler plant to be operated on powdered coal as a commercial undertaking. Because it is a pioneer in this field it does warrant particular notice. At present it is only in the course of construction and will likely not be ready to try out until August and not in full operation until Sept. 1. Therefore comment on its efficiency, cost and in general its success must be delayed until a demonstration is made under actual operating conditions.

DESCRIPTION OF POWDERED COAL PLANT

Raw coal will be delivered over the company's street-car tracks and dumped into a 500-ton bunker across the street from the station. This bunker can be enlarged to 1500 tons capacity. The coal will pass through a single-roll crusher rated at 75 tons per hour, which will reduce the coal to 1-in. (2.54-cm.) size, if not already of that fineness. A belt conveyor will carry the coal under the street to a 300-ton raw-coal bunker in the station. From this bunker the coal will pass over an apron conveyor, designed to empty the storage bin completely into either or both of the two Fuller driers. The driers have a capacity of 15 tons per hour each, are 55 ft. (16.8 m.) long and consist of single-shell steel cylinders, one 5 ft. (1.5 m.) in diameter and the other

*Years under water.

transported, stored and burned with the same equipment without physical difficulty.

Higher efficiency can be obtained than with any other means of combustion.

Powdered coal is not (contrary to a rather prevalent opinion) dangerous to handle.

Low-grade coals that cannot be burned efficiently in any other manner give good results in the powdered form.

The powdered-coal fire is easy to operate and de-

6 ft. (1.8 m.). A brick furnace covers more than half the shell, firing being accomplished from the side. Powdered coal will be used for firing both driers in burners designed by Mr. Santmyer.

The dry coal will be elevated in buckets to a bin holding 100 tons, from which it will be fed by gravity onto an apron conveyor leading to four Fuller pulverizers. Each of these mills measures 42 in. (106 cm.) and is designed to grind 5 tons of coal per hour fine enough so that 95 per cent will pass through a 100-

mesh screen and 85 per cent through a 200-mesh screen. In this type of mill the grinding is done by large cast-iron balls propelled around a race so as to press the coal against a wearing ring.

From the mills screw conveyors will carry the coal to a bucket conveyor, which will elevate it to the top of the building and deliver it into other screw conveyors that will take it to the steel bins over the front of each boiler. These bins will hold 15 tons each and will drop the powdered coal in front of the boilers, where it will be picked up by air at perhaps 6 oz. (26 gm. per cm.) pressure and carried to the bunker. This air will be furnished by two centrifugal fans, one on each side of the boiler room, driven by steam turbines exhausting into the steam heating mains.

Of the ten boilers, four are to be rated at 300 boiler-hp., three at 400 hp., one at 500 hp. and two at 600 hp. In the 300-hp. and 400-hp. boilers two burners will be used and in the larger boilers three burners. Three different burners will be tried out—Santmyer's, Muhlfield's and Fuller's. Mr. Santmyer's feeder and burner will be similar to that which gave good results in the experiments referred to before.

All the boilers will be equipped with Dutch ovens extending 5 ft. (1.5 m.) out in front, stretching the full width of the boiler, and standing 7 ft. (2.1 m.) high. Each boiler will also have a slag pit underneath. The slag pits will be of different design, according to the requirements of the feeder and burner, but each pit will have a clean-out door for the removal of slag.

OTHER POWDERED COAL DEVELOPMENTS

In addition to the Briquetteville plant the Pacific Coast Coal Company has powdered coal plants operating successfully at both its Black Diamond and Newcastle mines. At Black Diamond there are two 300-hp. Wickes water tubular boilers and ten 150-hp. horizontal return-tubular boilers, all fired by burners and feeders designed by Messrs. Santmyer and Ralph Galt. The coal is dried in a 10-ton Ruggles drier, fired with powdered coal and pulverized in a 5-ton Raymond mill. The unique thing with this installation is the absence of slag pits. The size of the boiler plant being sufficient to avoid forcing the boilers beyond 125 per cent rating, the furnace temperatures are low enough to prevent slagging.

The Newcastle plant is practically a duplicate of that at Black Diamond except that there a Fulton mill does the grinding instead of a Raymond.

In Seattle Messrs. Santmyer and Galt are changing the oil-burning plant in the Crystal Pool natatorium to powdered coal. The same boiler setting will be used without a slag pit as the two 150-hp. horizontal return-tubular boilers will make enough steam without undue forcing. A 10-ton steel bunker is being built to receive the powdered coal from a specially constructed auto truck which will haul the prepared coal from the Pacific Coast Coal Company's plant at Briquetteville.

As the Western Avenue plant will be the first large station to use powdered coal, so the Crystal Pool will be the first small isolated plant to burn pulverized fuel, delivered by auto truck. Should the actual results realize the expectations based on the experiments already made, present methods of burning low-grade coal will be altered considerably.

A WAR-TIME EXPEDIENT AND MEASURE OF ECONOMY

Growth of Load Cared for by Means of Change from
Two-Phase to Three-Phase Four-Wire
—Considerations That Governed

BY H. C. DEAN

General Superintendent New York & Queens Electric Light & Power Company

TO PROVIDE for growth in load the New York & Queens Electric Light & Power Company, Long Island City, N. Y., was confronted, not long ago, with the problem of increasing the rating of its distribution circuits about 30 per cent. In some districts it was possible to postpone the installation of additional copper in the feeders and obtain the increase merely by replacing 100-amp. regulators in the substations with 150-amp. or 200-amp. regulators. In the case of the Long Island City district, however, the current-carrying capacity of both feeders and regulators had been reached, and all regulators were of the maximum size (200 amp.) which the company considers it desirable to use.

CHOICE OF SYSTEMS

Three methods of solving the problem were open: (1) To install additional two-phase feeders (2300 volts, four-wire); (2) to install high-tension feeders and relieve the 2300-volt feeders of the larger consumers; (3) to change the 2300-volt, two-phase system to 2300/4000-Y volts, three-phase.

The chief question at first was whether or not it would be as cheap to change from two-phase to three-phase as to leave the two-phase system and transfer the larger consumers to lines operating at transmission voltage. A number of consumers are so supplied at the present time, and the company is looking forward to increasing such services to a large extent from now on. With the existing geographical layout of the lines and large consumers, the arguments were two to one in favor of changing the two-phase distribution system. However, this was due to local conditions, and it is possible that for other companies the advantages would be materially different, either greater or less.

Careful estimates showed that the third alternative would provide the necessary rating for less than half the expenditure required by the other methods, owing chiefly to the high cost of copper. It had the additional advantage that any future feeders would have 50 per cent greater capacity as three-phase feeders than as two-phase feeders, while the per cent line loss and voltage drop would be only half as great. To determine the relative advantages of three-phase over two-phase, it was therefore only necessary to determine the valuation of the existing distribution system (less the poles) and to balance 50 per cent of this cost against the cost necessary to change to three-phase.

In the Long Island City district the power load is about four times as large as the lighting load, consequently considerable work had to be done in making changes in the transformer banks. Although new consumers are provided with three-phase service, it was decided to continue two-phase, 230-volt service to existing consumers. This made it necessary to replace one transformer of each power bank with two of half the rating having 10 per cent taps. The connections and

the voltages obtained are shown in the accompanying diagram. There are no theoretical disadvantages in this method, as far as the writer can see, and it has given entire satisfaction for the past seven months.

METHOD OF MAKING CHANGE-OVER

To facilitate the work on the day when each feeder had to be changed from two-phase to three-phase

FIG. 1—METHOD OF SECURING CONVERTING FROM TWO TO THREE-PHASE WITH STANDARD TRANSFORMER

(which in every case was Sunday), the replacement of one transformer in each power bank with two of half capacity was made in advance, the two smaller transformers being connected in multiple temporarily. The testing of all underground 2300-volt services, the replacement of certain cable not safe enough for operation at 4000 volts, and the installation of pot-heads on all cable ends, constituted the only other preliminary work on the feeders themselves.

In the substation it was necessary to install a spare panel complete with equipment and three regulators for a three-phase feeder and to provide for maintaining one of the 2300-volt buses at three phase. This spare panel and equipment was used for the first feeder changed over to three-phase, which thus released a two-phase panel and the corresponding equip-

the fuse plugs of all power transformers were disconnected. The feeder was then switched from the two-phase bus to the three-phase bus and the power consumers were given service in the order of their needs. The change did not require rearrangement of the overhead circuits.

ECONOMIC ADVANTAGES

The change from two-phase to three-phase distribution in Long Island City district has resulted in a decided war economy, since it has made unnecessary the installation of additional two-phase feeders, the expense of which would have been five times the cost of making the feeder changes to obtain three phase. Furthermore, it has decreased the line losses by approximately 200 kw., which alone would pay interest charges on the cost of making the change. In addition, it has improved the voltage regulation 100 per cent, which means that better service is given and that loads at great distances from the substation can be more economically handled than heretofore, thereby delaying the day when additional substations may be required.

The company is now planning to change over the distribution system in the rest of its territory, which lies in the borough of Queens, comprising over one-third of the area of New York City. The population served is small compared with Manhattan's, but is about equal to that of Minneapolis.

The borough of Queens, which covers 117 square miles (30,000 hectares) of territory on Long Island, is considered to be growing more rapidly than any other section of New York City.

INTERNATIONAL TRADE-MARK REGISTRATION BEGINS IN CUBA

Bureau Opened at Havana as Result of Fourth Conference of American States at Buenos Aires in 1910

The International Trade Mark Bureau, for registration of trade marks of producers and manufacturers in the eleven northern countries of North America, Central America and the West Indies, has been opened at Havana, Cuba, under the direction of Dr. Mario Diaz Irizar, who will arrive in Washington shortly for conferences with United States Patent Office officials and the State Department, as a result of which regulations for the conduct of the bureau will be worked out. It may be decided to issue a monthly bulletin in English and Spanish, recording work of the bureau.

The Havana bureau and another to be opened at Rio de Janeiro result from the fourth conference of American states at Buenos Aires in 1910, at which an international trade-mark agreement was reached. The Rio de Janeiro bureau, which will provide for registration of trade-marks in the southern countries of South America, as the Havana bureau does for the northern countries, cannot be opened until three more countries have ratified the 1910 agreement at Buenos Aires. It was provided that two-thirds of the countries involved must ratify. Of the ten countries in South America only four—Brazil, Ecuador, Paraguay and Bolivia—have ratified so far. It is expected that some time during the coming year Peru will ratify and that eventually other South American countries will do so.

FIG. 2—METHOD OF ARRANGING FOR CHANGE-OVER FROM TWO-PHASE TO THREE-PHASE

ment. The panel in turn was built over to provide for the second three-phase feeder, etc.

On the day of actual change over of a feeder it was only necessary to change the connections of certain transformers and to transfer the feeder connections from the two-phase bus to the three-phase bus. Any power consumer who had to have service Sunday morning was permitted to use it until noon, by which time

Great Electrical War Convention in California

Central Stations, Manufacturers, Jobbers, Contractors and Dealers Discuss War Problems at the Annual Convention of the Pacific Coast N. E. L. A.
Section—Co-operation of the Industries

WAR problems were the chief topics discussed by representatives of all branches of the electrical industry at Del Monte, Cal., last week. In session with the annual convention of the Pacific Coast Section of the National Electric Light Association were the Pacific division of the Electrical Supply Jobbers' Association, the California Association of Electrical Contractors and Dealers, manufacturers' representatives and others, totaling more than 400 delegates. Even more than in the case of previous California conventions was this gathering notable for the variety of interests represented and the spirit of co-operation manifest. The advantage was not only in promoting closer relations and better understanding, but also in expediting action on matters where conference and agreement between the several branches of the industry were required.

President H. F. Jackson, Sierra & San Francisco Power Company, opened the meeting Thursday morning with a patriotic address, urging that all efforts be bent toward extending the usefulness of the electrical industry in war service and that closer co-operation in all branches be cultivated.

THURSDAY'S ENGINEERING SESSION

Thursday afternoon the engineering session was opened with J. E. Woodbridge, Sierra & San Francisco Power Company, in the chair. He reported that subcommittees working jointly with state and federal officials have rendered service in work on conservation and war measures.

F. D. Nims, Washington Coast Utilities, Seattle, and H. H. Schoolfield, Pacific Power & Light Company, represented the Northwestern Electric Light and Power Association. Mr. Nims said the use of powdered coal and sawmill refuse in the Northwest is helping to solve the fuel problem. Large industrial consumers have been induced to shift working hours so as to relieve peak conditions. Mr. Schoolfield described Portland's endeavor to conserve resources rather than energy and said that interconnection is receiving careful attention.

Fred H. Fowler, district engineer for the United States Forest Service, read a paper on the possibility of water-power development in California, Nevada, Arizona and New Mexico. The characteristics of the several drainage systems and their power sites were discussed and attention was directed to the large ratio of steam to water power. The small amount of hydroelectric development in recent years was noted and the need for a change in this regard was emphasized. Three prospective sources for increased power stand out, Mr. Fowler thought, as more notable than others in California. These are the Big Bend of the Pitt River, the combination of an increase in Great Western capacity on the Feather River with adjacent developments of the Pacific Gas & Electric Company, and the increase of capacity on the Big Creek system. On the Pitt River two alternatives are considered. One, promising 175,-

000 hp., would require a seven-mile (11.2-km.) tunnel, while the other, though of only about half the capacity, could be built in much less time. The Feather River project would afford about 195,000 hp. It involves two miles (3.2 km.) of tunnel. The Big Creek system could be increased about 300,000 hp. by adding to its drainage area. Because of the oil shortage and abundance of water power the electrification of mountain divisions of the railroads was urged. With the railroads now using three times as much oil as the next largest consumer, electrification must be studied in a new light.

Other papers presented at this session were: "Power Resources in Southern California," by H. A. Barre, Southern California Edison Company, and "Joint Operation of Power Companies," by J. P. Jollyman, Pacific Gas & Electric Company, San Francisco.

GOVERNMENT ANNOUNCES ITS FUEL-OIL PLAN

D. M. Folsom of the Pacific Coast Petroleum Administration announced by letter that fuel-oil users will be listed and classified probably within six months, and only those industries entitled to priority rating will be allowed to have oil. Public utilities will receive such rating only where industries served are entitled to priority, and the burden of proof of such priority shall rest upon the power companies. The oil supply will be exhausted within a year at the present rate, Mr. Folsom said, even with great economy. Drilling operations this year thus far show a 40 per cent decline as compared with last year.

L. S. Ready, Railroad Commission of California, reviewed the progress made in interconnecting transmission systems, pointed out that the State is two or three years behind in its hydraulic development and suggested developing small additional sources of energy wherever possible rather than concentrating solely on larger developments.

R. H. Ballard, Southern California Edison Company, suggested the desirability of securing financial aid from the War Finance Corporation in developing needed hydroelectric power. Without some such plan financing on the large scale necessary would be impossible. Prospects for such aid are improved by the amount of energy used on the Pacific Coast for irrigation pumping, because of the 800,000-hp. shortage on the Atlantic Coast found by the War Industries Board, and because of the extent to which hydroelectric development will release oil for the navy and the merchant marine.

P. M. Downing, Pacific Gas & Electric Company, said that the chief problem is how to finance the additional hydroelectric development which is urgently needed. With the completion of interconnections now under way the available energy will be utilized. This means that when the curtailment of oil comes load must be correspondingly dropped. John Hood, General Electric Company, San Francisco, drew a parallel between the unpreparedness of this country at the outbreak of the war and the present lack of definite plans

for electrifying mountain divisions. Because railroads are by far the largest consumers of oil and because locomotives burn oil at three times the rate normal in highly economical stations where equivalent energy could be generated preparation for electrification should be begun now.

S. J. Lisberger, Pacific Gas & Electric Company, San Francisco, stated that neither large hydroelectric developments nor electrification of railroads could be effected immediately and that our greatest problem is how to meet energy demands during the next eighteen months. To help in this he urged attention to the multitude of minor economies all can make, such as boiler-wall insulation, the use of economizers, efficient combustion and decreasing waste of energy at every point.

Mr. Barre stated that fuel consumption would always be necessary on electric generating systems. Not only is fuel properly used to carry peaks but it should also carry a part of the load in low-water years, thereby making economical larger hydroelectric installations. Two sources of electrical power in southern California can be made available very quickly, Mr. Barre stated. The Los Angeles Aqueduct can be made to produce annually an additional 100,000,000 kw.-hr., and the capacity of the Kern River plant No. 3 can be increased by 180,000,000 kw.-hr. These extensions would supply demand increases for about two years. The larger developments should also be begun now in order to be ready for further demand increases in two years.

Others who participated in the discussion were Max Thelen, president California Railroad Commission; C. O. Poole, Southern Sierras Power Company, Riverside; Edward Whaley, Northern California Power Company; W. M. Shepard, California-Oregon Power Company; E. A. Quinn, San Joaquin Light & Power Corporation, and E. R. Northmore, Los Angeles Gas & Electric Corporation.

WOMEN'S WAR SERVICE SESSION

On Thursday evening a war service session was held for ladies of the convention. Mrs. H. F. Jackson effectively outlined the purpose of conferences of women of the electrical industry and the great possibilities they give.

Miss Gertrude Tucker, secretary to the president of the Southern California Edison Company, explained how women employees have come to be recognized as worthy of training such as that given to the men, holding that the modern woman has genuine service ideals and a stronger spirit of loyalty than the men. Women employees in her company have increased from 50 to 250 and the employment of women station and switch-board operators is being contemplated.

Mrs. Frank A. Gibson spoke on the making of a loyal citizen, outlining work to be done for our foreign population.

FRIDAY'S ENGINEERING SESSION

At the Friday morning engineering session economies in operation of generating and transmission systems were discussed.

J. A. Koontz, Great Western Power Company, San Francisco, maintained that wearing bands shrunk on water-wheel runners and scroll cases have greatly increased the life and efficiency of units. The efficiency of worn runners can sometimes be improved by electric welding, he said.

Mr. Nims reported increased efficiency by carefully keeping tailwater elevation at the lowest level consistent with the seal on the draft tube.

G. R. Milford, Northern California Power Company, San Francisco, reported relieving hammering and vibration in a draft tube by tapping a faucet into it and opening it slightly.

Mr. Schoolfield described a 1900-hp. plant installed to utilize power from a 60-ft. (18.2-m.) drop in a canal system previously wasted. This plant has an induction motor running as a generator. It is entirely automatic and has been running four years without trouble. Although it will not synchronize itself when relieved of load, a gate control scheme has been proposed for shutting off power until speed drops down to synchronism. At present an attendant must be sent to the plant to resynchronize it. It is thrown back on the system at 5 per cent under or over speed. Substation and line losses were discussed in detail.

Mr. Lisberger disapproved of keeping the rate of line transformer burn-outs too low. Higher economy is secured by working them well up to capacity, expecting to replace burn-outs occasionally.

L. M. Klauber, San Diego Consolidated Gas & Electric Company, reported over-all losses of 22 per cent. For the Southern Sierras system Mr. Poole reported over-all losses in stations and lines of about 37 per cent. Discussion on lower rates under less strict guarantees on continuity of service failed to develop a feasible plan.

Economies in the boiler room was a live topic. There was agreement that automatic burner and damper control afford important savings, but where men must control fuel feeding a bonus for economy was urged. Mr. Klauber described a home-made automatic steam-pressure regulator for oil burners. He has found automatic boiler tube cleaners or soot blowers to be so productive of higher efficiency as to rate them as a necessity. Under war conditions more frequent cleaning of oil burners, condensers and all apparatus subject to clogging was urged.

Mr. Lisberger described a home-made device used to determine salt content in boiler water. Where more than 50 grains per cubic centimeter is found a remedy is applied.

Mr. Nims reported that powdered coal is often of superior grade when made of a poor-grade coal. It was suggested that California poor-grade coal deposits might thus be utilized. R. S. Masson, Arizona Power Company, Prescott, reported that his company recently completed a steam plant which produced 354 kw.-hr. per barrel of oil under test or 1 kw.-hr. per pound of oil. The plant averages 256 kw. per barrel in monthly records. High economy is attributed largely to automatic control. The oil is the same used as elsewhere and under test showed 18,650 B.t.u. per pound.

Mr. Klauber spoke of increasing preference for steel over copper for conductors. His company has more than 300 miles (482.8 km.) of steel conductors in service. Even where salt spray strikes the lines double-galvanized cable is expected to last fifteen years. The economy is not only in the price but also in poles, for spans are doubled when steel replaces copper, and in reduced erection costs. Standard steel spans are 700 ft. (213 m.) for 40-ft. (12.9-m.) poles. Mr. Downing urged that, in buying insulators, in addition to specify-

ing line voltage the conditions to which the line will be subjected should be mentioned.

Confidence was expressed in the economy and safety of reinforced-concrete stubbing of decayed wood poles. A pole that would cost \$50 to replace at present prices can be made safe in this way for less than \$8.

COMMERCIAL SECTION MEETINGS

The Commercial Section convened on Friday morning, with Chairman R. M. Alvord, General Electric Company, presiding. The session was devoted chiefly to discussion on the general subject of retail selling practice. This brought out agreement that data on accounting methods in retail electrical stores must be collected for the use of the co-operative campaign committee. The percentage of gross income that should be used on advertising, for example, has been fairly well established in other lines of business, and such data in the retail electrical business are urgently needed. Discussion was taken part in by J. C. Rendler, Southern California Electrical Company; Glen Arbogast, F. E. Newberry Company, Los Angeles; H. L. Kimball, Oakland, and Louis Levy, Levy Electric Company, San Francisco.

At the Friday afternoon session a paper by Mr. Bibbins on development of the community of interest was fully discussed. Mr. Ballard urged endeavor toward improving public relations and interesting employees, consumers and the public generally in investing in utility securities. This, he held, is the most effective and complete answer to the municipal ownership tendency.

Much of the Commercial Section discussion dealt with ways and means of aiding the commercial co-operative campaign. It was decided that further meetings be held from time to time in various parts of the State to promote further co-operation on the part of all branches of the industry interested. W. L. Goodwin, General Electric Company, New York, outlined the Goodwin plan and explained its advantages. He dwelt particularly on the danger in the Western field of allowing sectional views and interests to hamper progress. The industry is too closely interrelated to permit of any but a national viewpoint.

John A. Britton, as chairman of the public policy committee, read a report summarizing the present position of the public utilities and reviewing some of their problems and progress toward still greater war service. A policy that would engender public confidence was urged, and the great need for passing the pending water-power laws was emphasized. Ample funds are in the banks for power development if the safety and profit of the investment are assured. Meantime, though no water power is being developed and fuel is scarce, energy demand is increasing in California at the rate of 10 per cent per year. The report concluded with a resolution that Congress be urged to pass legislation directed toward discontinuing the waste of water power so that fuel may be conserved. The convention adopted the resolution and ordered copies sent to all congressmen.

A resolution was also adopted instructing the incoming officers to appoint a bureau of publicity to the end that the daily press may properly report events in the electrical industry.

Among other resolutions adopted were those provid-

ing that effort be made toward Americanization of foreign-born residents, that endeavor be made to secure aid of governmental bureaus in providing sufficient energy for maintaining service to war industries, that further study and extension be made on interconnecting systems, that effort be made to conserve energy resources, that an effort be made to ascertain the amount of fuel oil available so that business of the companies may be adjusted accordingly, that the commercial co-operative campaign be extended for an additional six months, and that jobbers' and dealers' associations be invited to meet again with the Pacific Coast Section of the N. E. L. A.

ELECTION OF OFFICERS

Officers of the Pacific Coast Section, N. E. L. A., for the ensuing year were elected unanimously as follows: President, Samuel Kahn, Western States Gas & Electric Company, Stockton; vice-presidents, E. R. Davis, Southern California Edison Company, Los Angeles, and A. G. Wishon, San Joaquin Light & Power Company, Fresno; secretary, A. H. Halloran, *Journal of Electricity*, San Francisco; treasurer, J. F. Pollard, Sierra & San Francisco Power Company; executive committee, H. F. Jackson, H. A. Bostwick, J. B. Black, William Bauerhyte, George A. Campbell, D. E. Harris, Frank Somers, C. M. Einhart, S. Aller, H. E. Van Kuran, H. H. Jones and A. E. West.

JOBBERS' ASSOCIATION MEETING

The quarterly meeting of the Pacific division of the Electrical Supply Jobbers' Association was held at Del Monte just preceding the joint convention. Two open sessions were held, in which J. J. Gibson, Westinghouse Electric & Manufacturing Company, and W. L. Goodwin, General Electric Company, discussed laws for stabilizing trade conditions. Mr. Gibson had gone to the Pacific Coast from the East especially to discuss at this meeting his plan outlined in the March issue of *Electrical Merchandising*. The plan of basing discounts on each order on the quantity of that order was approved. The sense of the meeting was that, although adjustments must still be made, the Goodwin plan, which is the Pacific Coast plan, and the Gibson plan could be worked together. The next meeting of the jobbers' association was set for the middle of August at Paradise Valley, in Rainier National Park.

CONTRACTORS' AND DEALERS' MEETINGS

The California Association of Electrical Contractors and Dealers in its separate sessions decided unanimously to join the national association. Its sessions took on a broader tone because of the attendance of jobbers and manufacturers' representatives, who frequently participated. Two sessions devoted exclusively to the interests of motor men proved so helpful that a permanent motor section was proposed. Papers on motor sales were presented by F. W. Buzzell, San Francisco; C. E. Ingalls, San Francisco; H. H. Courtwright, Fresno, and E. Boyd, General Electric Company, San Francisco. The chief topics were the relations between manufacturer and agent and how to build up motor business.

In answer to the complaint that the motor business does not pay, Mr. Boyd affirmed that it does pay if properly managed. The study of motors, in order to analyze customers' needs and render service after the

sale, was urged upon dealers. The question of who is entitled to motor agencies was discussed at length, and all were in accord with the point that only those able to make sales intelligently and to render service should be so recognized. W. H. Gribble, Chico, suggested that one of the subjects of frequent controversy could be settled by making discounts only to motor agents.

COMMITTEES TO GET TOGETHER

T. E. Bibbins, Pacific States Electric Company, San Francisco, urged that dealers get together and agree on improvements desired in the present plan. Manufacturers would welcome a uniform plan, he said, but while all sections of the Pacific Coast demand different action no changes whatever could be expected. These were the sentiments of the meeting. The dealers appointed a committee of three, and the manufacturers were asked also to appoint a representative committee in order that uniform plans might be agreed upon and steps taken to put them into effect.

The manufacturers' margin is small; so methods whereby the dealer can increase his profits on the present basis were considered. Study of the means of increasing rate of turnover and volume of business was suggested. Investigating the requirements in special lines, such as the printing trade, woodworking shops, etc., was advised. Purchasers will prefer dealing with local men rather than with manufacturers if the former render the desired service. Motors should not be sold to get wiring jobs, and the awarding of agencies to unscrupulous dealers was also condemned.

Chairman Frank J. Somers, San José, went on record as opposed to any more closed meetings of the association.

Among others who spoke were R. A. Balzari, Westinghouse company, San Francisco; W. S. Berry, Western Electric Company, San Francisco; A. J. Myers, Wagner Electric Company, San Francisco; P. H. Affolter, Garland-Affolter Engineering Company, San Francisco; F. S. Thomas, Valley Electrical Supply Company, Fresno; C. L. Lamoree, Westinghouse company, Los Angeles; C. F. Butte, Butte Engineering & Electric Company, San Francisco; C. S. Renwick, Richmond, and Frank E. Doerr, San José.

ENTERTAINMENT FEATURES

The joint entertainment features proved most effective in facilitating closer relationships, and at the Friday evening banquet a stirring patriotic address by Prof. Charles Mills Gayley, dean of the faculty of the University of California, brought home to all the importance of enlisting every resource and individual in win-the-war service.

Kingston, Jamaica, Reports Good Year

In the annual report of the West India Electric Company, Ltd., for the year ended Dec. 31, 1917, James Hutchinson, the president, says: "In consequence of a plentiful rainfall throughout the year the hydraulic station has been able to supply the necessary power for operating, with only occasional assistance from the auxiliary steam station; therefore the consumption of coal has been small. The company has been very fortunate in this respect during the last three years, especially as coal in Kingston has more than trebled in value."

Selling the War Savings Stamps as Steps Toward Liberty Bonds

NOTICE TO EMPLOYEES

We have no sympathy with workmen we have heard of who willfully slow down during regular working hours and days so as to make overtime necessary; and if any of these appear on our force they will be the first to get laid off. We are only too glad to pay tribute to all of our men who have worked for us steadily, and to say that no such criticism has ever been directed against them.

Sometimes, particularly on urgent work for the Government, overtime is absolutely necessary. If, under these circumstances, our employees earn overtime, we strongly urge them to put it, or in any event, a large part of it, into War Savings Stamps.

The virtues of U.S.S. are too well known to be dwelt upon here; but we remind you that every stamp you buy helps to shorten the war and is the safest and best way to save. When January 1, 1923, comes around, work may not be as plentiful as it now is, and you may be very glad to have War Savings Certificates to cash in.

You will find in each pay envelope a form to be filled out, indicating the amount of your pay you will be willing to take in war stamps, we having been appointed an authorized agent of the Treasury Department to sell stamps at cost.

F. W. LORD,
President.

"While a great many workmen may not be able to subscribe for Liberty bonds, there is no one who cannot buy war savings stamps," says F. W. Lord, president Lord Electric Company, New York. "In order to inculcate the thrift habit, we have caused this notice to be posted up wherever our men are at work.

"There is no question but that the war savings habit makes a strong and solid foundation for investments of the larger order, such as Liberty loan bonds, and we are encouraging all our workmen to save as much as they can afford, believing that it will not only be to their own benefit but to the benefit of the country."

WAR TENDENCIES NOTED BY UNDERWRITERS' LABORATORIES

Dana Pierce Speaks to Electric Club-Jovian League of Chicago on the Work of the Underwriters' Laboratories and the War

Speaking before the Electric Club-Jovian League of Chicago on May 9, Dana Pierce of the Underwriters' Laboratories, New York, told of the large amounts of wire and conduit which are being inspected by the regular forces of the laboratories, thus relieving, through systematized inspection, many men for other war work who would otherwise be required in an organization built up especially for such inspection purposes.

In commenting upon the tendencies which have been noted by the Underwriters' Laboratories in the development of electrical material during the war, Mr. Pierce stated that appliances to assure greater safety were decidedly in the ascendency. These are of two classes, namely, arrangements for grounding and arrangements for effecting inclosures of current-carrying parts. He dwelt at some length on the complications entering into problems of inclosing electrical equipment.

It was the prediction of Mr. Pierce that after the war there would be a marked advance in the field of electrical signaling growing out of work that has been done in the war. He also stated that there is at the present time a pressing need for the development of devices which will afford slightly, safe and inexpensive methods of extending light and power outlets from completed jobs. The now common flexible-cord method of carrying on this work met his severe criticism.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

SPECIAL CALIBRATION OF STEAM-FLOW METERS

Full-Load, Load and One-Half and Double-Load Points for Units on Which Meters Are Used Are Shown by Red Markers

Additional markings are sometimes desirable on steam-flow meters used on individual boilers to indicate the full-load, load-and-one-half and double-load points. A meter calibrated in this manner is shown in the ac-

100, 150 AND 200 PER CENT LOAD POINTS INDICATED ON SCALE

companying illustration, the points mentioned being indicated by pieces of red paper pasted on the white dial. They may be easily removed if desired.

SHOP VERSUS FIELD TESTING OF NEW WATT-HOUR METERS

Minneapolis General Electric Company Favors Testing in the Field Exclusively—New Meters Are Set Without Testing After Rigid Inspection

Many central stations, according to George W. Hewitt, meter foreman of the Minneapolis General Electric Company, are actually wasting time and money testing new meters just received from the factory. Virtually all factories ship meters which are guaranteed to be accurate within 2 per cent. Testing the meters in the shop, carting them around all day in a vehicle, often installing them wrongly and not testing again for a year or so induces much "lost motion." "A shop test as compared with a service test, especially on direct-current meters, is not worth the money expended on it," says Mr. Hewitt.

In his opinion, the only test worth consideration is that made under actual service conditions. When the commutator of a direct-current meter, for instance, is polished and the meter adjusted it will be found that aging due to the oxidation of the silver commutator affects the meter and that a test made from thirty to sixty days after installation will show different results from a shop test or that made at the date of installation. Then, again, local and earth magnetic fields affect meters to a large extent, depending on the position of the meter. Errors of 5 to 10 per cent sometimes result from this cause.

The Minneapolis General Electric Company meter department does 90 per cent of its testing in service, holding its shop testing to a minimum. Meters which are repaired in the shop are adjusted within 2 per cent of complete accuracy, and new meters are not tested at all. They are thoroughly inspected and then tested within thirty days after the installation and adjusted to within 0.5 per cent of accuracy. The fact that 95.7 per cent of the installations tested are within the legal limit of 2.5 per cent accuracy seems to bear out the contention that this method of testing is satisfactory. According to the records, only eighteen meters out of 4309 recently installed failed to register. This plan of testing meters after installation has the further advantage of being a check on the men who install the meters.

FLEXIBLE DISTRIBUTION AS USED IN CLEVELAND

Emergency Connection Boxes Arranged So that Service Can Be Maintained in Case Transformers Feeding Any Section Break Down

By employing the arrangement represented in the accompanying illustration the Cleveland (Ohio) Electric Illuminating Company prevents the spread of any disturbances and also makes it possible to maintain service in case transformers feeding any section break down. The corresponding terminals of the transformers are connected with different phases so that a practically balanced load is maintained on the three-phase primary circuit.

The secondary system is primarily for 220-110-volt lighting circuits, but three-phase power loads can be carried by the open-delta connection provided. The lighting circuit is connected across terminals 1, 2 and 3, 220 volts existing between the outside wires and 110 volts between the outside conductors and intermediate wire.

The secondary mains are arranged in rectangles, provision being made for connecting adjacent sections through the emergency connection boxes. The circuits at these points are normally left open to prevent the spread of any disturbances which may occur in any section. When the emergency connections are made

they cannot be run straight through, as the phase relations differ in adjacent sections.

If the transformer bank in the middle section, for instance, cannot be used, it is disconnected from its particular section of the secondary system and the corresponding phases are joined in the emergency connec-

EMERGENCY BOXES SECTIONALIZE SYSTEM BUT PERMIT CONNECTION WHEN NECESSARY

tion boxes between this section and the adjacent ones. With this arrangement the transformers on each side of the section will each be required to carry 50 per cent of the load in the intermediate section.

VERTICAL TAPS SIMPLIFY THE TURNING OF CORNERS

Method of Construction Which May Be Employed at Street Intersections Where There Are Wide Curbs and Rounded Corners

Corner work is often complicated and difficult to install with adequate clearance between wires in cities having wide curbs with rounded corners at street intersections. Single-pole buck-arm corners are generally impracticable even when side or alley arms are used, since the wires are brought too close to buildings thereby. Therefore a double-pole corner must be installed with connecting cross-overs run between poles.

FIGS. 1 AND 2—OLD AND IMPROVED METHODS OF CONNECTING LINES RUNNING AT RIGHT ANGLES

Vertical taps are sometimes employed rather than cross-overs as they give a neater installation. They are, however, more difficult to place, particularly where the poles are so high that the taps cannot be made from tower wagons.

A special installation in which considerable saving in first cost with added safety and simplicity was se-

cured by means of vertical taps and special line insulators is illustrated in the accompanying figures. In this case two independent 11-kv. circuits passed by a street intersection where it was desired to provide a branch from each circuit, one to the right, the other to the left. The usual method of installing cross-overs would have required the construction shown in Fig. 1. Owing to the relatively high voltage of the circuits a 45-deg. buck-arm would have been required on the higher pole in order to secure proper clearances. However, by installing vertical taps and strain insulators as shown in Fig. 2, the construction was greatly simplified, both as to dead-ending and guying. Strain insulators were installed in pairs to secure an added factor of safety, although single units were sufficient for the voltage here employed. The insulators and taps are so placed that under normal operating conditions with both lines energized there is no potential across the insulators. The taps were installed by a lineman working from a temporary steel cable swung across the span.

GRAPHIC METHOD OF MAKING REPORTS OF PROGRESS

Adapted Especially to Transmission and Distribution Construction—Saves Clerical Labor and Still Is Complete

A form of graphic and tabular progress report adapted to transmission or distribution line construction is illustrated herewith. Field construction parties are not ordinarily well fitted for clerical work, and this form of report, which may be blueprinted or mimeographed in advance, will save considerable labor without sacrificing completeness. The lines showing progress for the current week may be dotted, as shown in the diagram, or entered in a different color from the rest of the completed work. If a background of cross-section paper is used with a scale of one hundred spaces to the entire distance, the percentages may be read directly. Vertical lines are drawn and pole num-

PROGRESS OF DIFFERENT LINE INSTALLATION OPERATIONS INDICATED BY LENGTH OF LINES

bers entered only at significant points. Obviously every pole cannot be indicated, but indicating the exact pole at which work began or stopped adds definiteness to the report. The proportion of the work done up to date and for the week, the foreman's name and other pertinent information are given at one side of the chart, as shown above.

CENTRAL STATION SERVICE

Light, Power and Heat

ELECTRIC PROCESS IN THE MELTING OF BRASS

H. M. St. John of Commonwealth Edison Company
Gives Present Status of Electric Brass Melting
and Discusses Central-Station Point of View

Important advances in the art of melting brass by electricity have recently been made, and the present outlook warrants a considerable degree of optimism, says H. M. St. John of the Commonwealth Edison Company, speaking before commercial members of the Ohio Electric Light Association at Cleveland on May 8. "So far as yellow brass is concerned, it cannot be said that an entirely satisfactory furnace has yet been produced," said the speaker, "but the field has been partially covered, and the prospects for future advancement in the art are good. In 1914 it was estimated by H. W. Gillett of the United States Bureau of Mines that there were 3600 plants engaged to some extent in melting brass and bronze. It was further estimated that the value of the metal annually melted by these plants was in the neighborhood of \$120,000,000. Of this amount the metal lost beyond recovery during the melting operation was not less than \$3,000,000." Mr. St. John continued:

If all the brass and bronze produced in the United States could be melted in electric furnaces, the annual consumption of electric energy for this purpose would be in the neighborhood of 200,000,000 kw.-hr. and the generating capacity required to supply the necessary power would be about 75,000 kw. There is little reason to expect the complete electrification of this industry either now or in the future, but the expansion in this field which may reasonably be expected is sufficiently large to be interesting to the central-station companies.

A central station not only has an object in promoting the satisfactory progress of this development but has at stake interests which can only be protected by a constant oversight of such features of development as directly concern itself. For example, all furnaces are not equally satisfactory from the standpoint of economical power supply, and the power company which expects to furnish power for an electric furnace installation should, for its own sake, be familiar with the electrical and operating characteristics of the furnace.

Not all electric furnaces are good. Good electric furnaces can be misapplied. Such misapplications have been made and are now being made. Good electric furnaces properly applied may result in failure because of faulty operation. This, too, has happened. When such a failure occurs three parties suffer. The user of the furnace has lost some money, but he can go back to his old practice and use a fuel-fired furnace. The seller of the furnace has lost a customer, but he can find another, a few hundred miles away, who has never heard of the failure. The central station has lost an opportunity to extend a profitable phase of its business. Every such failure becomes town talk, in an industrial sense, in the community in which it has occurred, and makes it increasingly difficult to promote the use of electric furnaces in that locality. The business of the central station is generally limited to a relatively small territory, and its loss of possible future profits is correspondingly greater because more concentrated than that of the seller of electric furnaces.

The central-station industry has something to gain by the successful development and use of electric furnaces. It has something to lose by their failure. It is in a position to protect this interest and should do so by informing itself quite fully concerning the possibilities of electric furnace application within its territory.

METHODS OF ASSESSMENT FOR ORNAMENTAL LIGHTING

A Discussion of the Existing Situation in Syracuse,
N. Y., Defending the Equal Division Be-
tween the City and the Abutters

The question of who shall pay for an ornamental lighting system, and in what amounts and according to what conditions, keeps continually coming to the front. The situation in Syracuse, N. Y., in this connection is discussed by A. R. Acheson, consulting engineer, in the following paragraphs, which were addressed to the Commissioner of Public Safety:

The ornamental lamps were installed and are maintained as an advertising proposition. If this be conceded, then citizens who recognize, with us, that the system is not economical from a lighting standpoint, should ask the question whether the system has been effective as an advertiser of Syracuse and whether such advertising has been of the kind to help Syracuse. In our judgment, the answer must be a decided yes. Consideration of a future system of ornamental lighting should include the advertising feature. Further, if the advertising feature be conceded, then it follows that the cost of maintaining the system should be borne by those benefited by the advertising. The city at large is benefited, but the abutting property owners more especially. If the exact value of the advertising to the abutters and to the city were known, the cost of the ornamental lamps could be equitably assessed. Such advertising value cannot be definitely known, and so an arbitrary division of the cost was established by law, whereby the city at large pays not more than 50 per cent of the cost of the ornamental lighting, the other 50 per cent being assessed on the abutting property owners "in the same manner as are ordinary taxes," i.e., "according to valuation" of the abutting property. As you have shown, the legal authorities now agree that the present law compels assessment "pro rata according to the valuation of abutting property" and does not permit of assessment according to foot frontage or any other method.

When ornamental lamps are installed in any new district of low valuation the burden of the cost of such lighting falls on the high valuation district; hence we have the queer case of the outlying district getting something at the expense of the center district and at the same time getting advertising which attracts trade away from the center district. This is manifestly unfair and has led the city administration to consider having the law changed to permit other methods of assessment. Other methods proposed are these:

1. Assess according to front footage.
2. Assess half of the abutters' cost according to valuation and half according to foot frontage.
3. Assess according to the land valuation only.

Those who advocate retaining some portion of the assessment "according to valuation" do so on the theory that the large department store, for instance, gets more advertising than does the small store with same frontage. This is

debatable. Objectors to foot-frontage assessment say that vacant lots are unduly assessed. It is noticeable, however, that the demand for extension of the system comes from locations where vacant or poorly developed sites predominate. Please note the proof of the advertising feature.

Some contend that the advertising should be paid for as other advertising is—every one pays the same amount for the same quantity of printed matter. Hence ornamental lamp advertising should be according to the foot.

Some say the streets are being used for advertising, and so the cost of such use should be in proportion to the traffic, and hence approximately in proportion to the valuation.

An arbitrary decision must be made. The writer favors assessing 50 per cent on the city at large and the remaining 50 per cent on the abutters according to the front footage, after a deduction has been made for any lighting that is eliminated when such ornamental system is installed.

It may be well to call attention to the fact that if the law is changed and assessments are made according to foot frontage or some similar method, there will be a considerable readjustment of the burden of the cost on abutters. The owners in districts of low valuation will have their assessments increased. This may lead to an agitation for having the city pay the whole cost; in fact, some are raising that issue already. In our judgment, it would be a mistake for the city to assume all the cost of the ornamental system, as that would be discrimination in favor of the center district and would open the way to unwarranted demands upon the city for extensions of the system, the 50 per cent deterrent having been lost.

EXISTING LEGAL STATUS OF CONTRACTS FOR POWER

A Public Utility May Publish Rates for All Classes of Service, but Is Not Permitted to Alter Them by Contract or Otherwise

The often-discussed subject of whether certain deviations from the published schedule of rates invalidate contracts for service was dealt with by Leroy E. Eastman at a recent meeting of the new-business co-operations committee of the Ohio Electric Light Association under the title "The Legal Status of Power Contracts."

He went into the status of a contract which provides that electricity shall be furnished to a certain customer during a term of years at a rate different from the published rate; of a contract which contains a published rate when made and where during the term of the contract the published rate is changed; of a contract whereby the company agrees not to change existing schedules, and of a contract which places a consumer in a class other than that in which his actual physical condition would naturally place him.

The author pointed out that the courts of every state have consistently condemned every special contract or private arrangement which differed from the regular published schedules and which in effect created a preference, or which tended to discriminate in favor of an individual consumer. The intention of the parties, he stated, is of no consequence, and the only consideration is the question whether or not the situation in which the court finds the parties is one which will lead to an evasion of the statute and will open the door to unequal rates.

This is upon the general principle that ignorance of the law is no excuse, and if the direct object of the parties is to do an illegal act, the agreement is void, and it is immaterial that either or both did not know that the object was illegal, and also upon what is perhaps the more sound view that the published schedules are open

for public inspection at all times and the consumer is charged with knowledge of their contents.

Thus, it was stated, a contract specifying rates less than those named in the schedule is wholly illegal and will not be enforced though there was no intention to violate the act. Furthermore, contracts fixing rates for a series of years are of no force, it was shown, against subsequent lawful change in rate within the period covered by the contract. Such contracts have been condemned in many cases. The courts adopt the view that the law is a part of every contract, and the parties to such a contract take it subject to any change which may thereafter be made in the rate.

It was also stated that contracts which attempt to place a customer in a certain class are held to be invalid.

In considering each of these situations actual cases were cited, and in every one the only point in which the courts seem to be interested, according to the author, is whether or not the contract or arrangement amounts to discrimination or produces any of the results forbidden by the statute.

No distinction, it is stated, has been made between contracts made before and those made subsequent to the passage of the public utility acts. It would seem that the various state statutes would not have the effect of abrogating pre-existing contracts because of the provision of the federal constitution that the state shall not pass laws impairing the obligation of contracts; but the courts hold that such acts are properly within the police power of the state and may be enforced even against pre-existing contracts.

"It seems clear," the author said in conclusion, "that the duty of the utility is to publish a tariff for every class of service which it has to sell, and that it has no power to alter or vary the rates fixed by those schedules by any contract, arrangement or device whatsoever. A complete remedy is afforded by the statute to both the utility and the consumer by complaint filed with the commission for relief both against insufficient and against unreasonable rates."

METER ACCURACY OF ONE COMPANY AFFECTS OTHERS

Good Practice for Large Companies to Check Standard Meters of Smaller Neighboring Utilities if Requested to Do So

It is the policy of the Minneapolis General Electric Company to calibrate the rotating standards of the smaller neighboring utilities at cost. This plan is adhered to regardless of any amicable relations that may have been established between the larger company and its smaller neighbors by underlying financial relations or by cordial relations among the personnel of the organizations. It is thought to be good policy purely in the interest of keeping all nearby standard instruments in accurate running condition. This accuracy in turn is reflected in the meters of individual customers. Hence, when the Minneapolis company gets a new customer who has been living in one of the surrounding towns it does not get from him a complaint arising from the fact that his meter at his old home was slow while the meter in his Minneapolis home registers correctly. Such a condition was entirely likely under the older methods of handling meters.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Relative Advantages of Three-Phase-Monophase Current Converters.—CESARE DELLA SALDA.—The synchronous type of converter, besides being able to function simultaneously as a synchronous condenser, has the possibility of being used with more than three phases. The series type, in its varied forms, is simpler, does not require automatic apparatus and is more economical. This type is advantageous if it is desired to derive current from a single phase of a three-phase network. It does not, however, permit correction of power factor. The different types of asynchronous converters have the advantage of improving the power factor.—*L'Elettrotecnica*, March 25, 1918.

Generation, Transmission and Distribution

Fuels and Their Efficiency for Central Stations.—NEWTON HARRISON.—Good and bad fuels, heat value and composition of fuels, free-burning fuels, caking, coking, difference between anthracite and bituminous coal, the amount of air required, low-grade fuels and the amount of heat required to evaporate water are subjects discussed in this article.—*The Central Station*, April, 1918.

Improvements in Waterwheel Efficiency.—E. C. HUTCHINSON.—The subject is divided into three parts: (1) Improvement in power output by the installation of modern waterwheel runners, the rest of the equipment remaining the same; (2) improvement of power output through decreasing the size of the water-economizing nozzle; (3) general improvement of the entire unit by installing both modern waterwheel runners and water-economizing nozzles.—*Journal of Electricity*, April 15, 1918.

Electric-Power Supply at Buenos Aires.—This article deals with the equipment and various classes of apparatus used in the installation and is copiously illustrated with instructive diagrams.—*London Engineering*, March 1, 1918.

Joint Operation of Power Companies.—J. P. JOLLYMAN.—The results of operating power companies jointly, made possible by the interconnection of their power lines, are embodied in an appendix to the article.—*Journal of Electricity*, April 15, 1918.

Linking Up Rural Communities in Iowa.—How the inefficiency attending the independent operation of comparatively small electric light properties in Ohio has been avoided by interconnecting their systems is discussed in this article.—*Chicago Electrical Review*, April 6, 1918.

Use of Pulverized Fuel and Its Possibilities in the War.—F. P. COFFIN.—The first section briefly summarizes the advantages of pulverized coal, treats of the suitability of its use as fuel for stationary boilers, locomotives, steamships and metallurgical furnaces, and recommends its adoption to conserve our coal resources and to release for military use the fuel oil

now burned for industrial purposes. Following a description of the indispensable part that electric power plays in the preparation, handling and burning of pulverized fuel, the second section of the article presents an impressive list of the American users of pulverized fuel.—*General Electric Review*, May, 1918.

Interconnected Power Systems of the South.—This article deals with the hydroelectric systems of independent companies operating in five Southern states which are interconnected into one vast transmission system, permitting considerable economies in operation. The layout of the different plants and statistical data regarding their ratings, loads, power factors and yearly output are given in the article, which is illustrated by a map showing the high-tension network considered.—*Metallurgical and Chemical Engineering*, May 1, 1918.

Secretary Lane Urges Water-Power Development.—An interview with Secretary of the Interior Lane, who is quoted as saying: "The electrochemical industries of the United States have been found particularly essential to the conduct of the war, and yet they have not had adequate power. If these industries are to be fostered in this country and their extension made possible, it will be necessary to provide more power; otherwise we are confronted with the expatriation to more favorable localities of those industries which should be established here. More power should be developed at Niagara, and I believe that the United States and Canada should enter into an agreement for a large international development there that will make 1,000,000 hp. available to both countries. It is not at Niagara alone, however, that we need to develop water power. Our program should encourage development throughout the country wherever there seems to be a necessity for it and wherever we have mineral resources contributory to electrometallurgical industries."—*Metallurgical and Chemical Engineering*, May 1, 1918.

Hydroelectric Economies.—J. P. JOLLYMAN.—As much as 77 per cent in over-all efficiency has been obtained in the hydroelectric plants of one Pacific Coast company by replacement of obsolete equipment and other improvements in combination with an effective system of testing and checking performance. The best efficiency obtained with impulse wheels was about 82 per cent and with Francis turbines from 85 to 87 per cent. The value of accurate continuous records of the amount of water supplied to the hydroelectric plants has justified the installation of Venturi meters in the pipe lines of their most recent plants. Automatic nozzle control is not used on any of the impulse units. All of the high-head Francis turbine units are equipped with relief valves adjusted to close automatically when desired. "Improvements in efficiency may be expected," says Mr. Jollyman, "from a change in buckets, (a) if the form of the original buckets does not approximate closely to the best modern types, (b) if the buckets have become pitted or waved, (c) if the buckets have

so worn at the entrance as to permit the spilling of live water, or (d) if the buckets have holes worn through them to a material extent." Data showing the pipe line, waterwheel, generator and transformer efficiencies of three hydroelectric plants are given.—*Journal of Electricity*, April 15, 1918.

Traction

Railway Substation for Paris Railway.—LUCIEN PAHIN.—Description of the substation erected in 1914 at Bagneux on the electrified railway line extending from Paris to Anthony, a distance of 8.3 km. (5.18 miles). This substation is rated at 1300 kw., two six-phase commutators of 425 kw. each having been installed, with provision for a third. Three-phase current at 50 cycles and 15,000 volts is furnished by the central station at Issy-les-Moulineaux and stepped down to 450 volts.—*L'Industrie Electrique*, March 25, 1918.

Installations, Systems and Appliances

The Radioscope in the Treatment of Wounded Men.—A new radiosopic method of discovering projectiles in the bodies of the wounded. The apparatus requires only a disk and two wires, and it necessitates no calculation, no tracing on the screen and no removal of the patient. The location of the foreign body is shown by a simple reading.—*Revue Générale de l'Electricité*, March 30, 1918.

Steel Plant Applications.—F. B. CROSBY.—The article is devoted to a description of the process of manufacture of steel wire at the plant of the Keystone Steel & Wire Company, starting from the raw materials with which the open-hearth furnaces are charged and ending with the finished product. Interspersed between the sections describing the process are descriptions of the electric equipment which vitally contributes to the successful operation of the plant. The layout of the plant is illustrated by diagrams, and curves are presented showing the speed-horsepower and speed-torque for reversing blooming mill drive.—*General Electric Review*, May, 1918.

Electric Furnaces for Melting Brass (Editorial Comment).—The main reasons underlying the economic change, now taking place, from fuel-fired to electric brass furnaces are to be found in the conservation of time, metal and fuel, improvement in the sanitary conditions of the foundry, and the higher strength and uniformity produced. The metallic loss, especially of zinc, is said to be reduced to at least one-half. With thermal efficiency averaging perhaps seven times that of a fuel-fired furnace, the electric furnace affords a great saving even when using energy from a steam-electric plant. With hydroelectric current the saving is considerably increased. The saving of time and labor per unit of production is of special importance, especially under present industrial conditions. There are on the market to-day over a dozen different electric furnaces for non-ferrous metallurgy, representing five different types, namely, induction, radiating-arc, direct-arc, resistance and high-frequency. These are used for the production of a variety of metallic alloys which may be classified substantially as follows: (a) yellow brass with less than 3 per cent lead; (b) red brass and bearing-metal irrespective of the lead content; (c) red brass with low lead content, and (d) the aluminum mixtures. The induction furnace is the type hitherto

found most suitable for melting yellow brass with a spelter loss of 1 per cent or less. This is due to that characteristic of the induction furnace which permits accurate heat control, with consequent uniform temperature throughout the bath of metal. The advantage is obvious if it is desired to keep the volatilization of zinc at a minimum.—*Metallurgical and Chemical Engineering*, May 1, 1918.

Miscellaneous

Eliminating Corrosion Caused by the Carbonic Acid Contained in Steam.—CH. CHOROWER.—In an article previously published (*Revue Générale de l'Electricité*, Nov. 17, 1917) the author attributed the corrosion of boilers and steam-driven machinery to the action of the carbonic acid contained in steam and advocated ridding the feed water of this gas. In the present article he gives the result of seven years' work along this line and claims to have demonstrated scientifically, as the outcome of experiments in the central station of Lisbon, Portugal, that by preliminary chemical treatment of the water and subsequent watchfulness corrosion can be eliminated.—*Revue Générale de l'Electricité*, April 6, 1918.

The Rivetless Ship a Possibility.—Electric welding as a substitute for riveting is being tested by the government at four shipbuilding yards, and so far the work is proving highly satisfactory. According to recent data, the process will increase the strength of the joint at least 25 per cent and decrease the time to get out a hull nearly 50 per cent. Eminent marine engineers claim that there will be a saving in labor of 60 to 70 per cent. The machine employed is the Wilson welder. At present the plates are being lap-welded, the plates being overlapped at least 2 in. (5.1 cm.), sometimes more, and each edge welded down. In the future it is the intention to butt-weld the plates, in which case they will be beveled so that when placed edge to edge V-shaped grooves will be formed, into which the welding metal will flow, leaving a welt over the top of the V. The reverse side, the one exposed to the sea, will be left perfectly smooth. By this method considerable steel will be saved which otherwise is wasted by overlapping, and at the same time the weight of the ship will be reduced. Plates 3½ in. (8.9 cm.) in thickness have been welded, this being the maximum thickness used on the particular jobs where observations are being made. The advisability of casting entire steel sections and then welding them together is also under consideration. While electric welding will eliminate the use of rivets to a large extent, there is at present a certain amount of riveting to be done in attaching the plates to the frames. Repair work can be done without removing the broken parts from a ship. When a vessel comes into port with a broken cylinder the repair can be made on board. No preheating or annealing is necessary. A novice can be developed into a satisfactory electric welding operator in thirty days, and from available data it is estimated that thirty welders can do the work of 125 riveters. The Wilson welding outfit operates on what is known as the arc principle and consists of a motor-generator set, the generator of which is wound for 35 volts. The welding metal serves as one electrode, while the ship plates constitute the other electrode.—*Marine Review*, May, 1918.

Scientific and Industrial Research

A Department Devoted to Interchange of Ideas, Investigations Contemplated, Research Facilities Available, and Suggestions for Co-operative Work.

Conducted by PROF. VLADIMIR KARAPETOFF

Cornell University, Ithaca, N. Y.

Apparatus Available*

LAMPS, ACCURATE LIFE TEST.

Booster transformers are used in the individual lines to life-test racks for incandescent lamps, in order to maintain the exact voltages required, irrespective of the load. There are forty voltage steps, covering a total range of less than two volts.—Clayton H. Sharp, *Electrical Testing Laboratories, New York City.*

Suggestions for Research*

ARC RECTIFICATION.

A systematic study of very short arcs or sparks displaying themselves between two electrodes of different material is urged as a means of developing rectification methods. Water-cooled copper as the anode and carbon as the cathode seem to be quite suitable for this work. The arc gap ought to have large cooling flanges which tend to enhance the de-ionization and to reduce the temperature of the path of the arc at the time when the arc is supposed to be extinguished. A careful study of a quenched spark gap would be a good introduction to any one who should care to attack this rectifier problem.—August Hund, *Berkeley, Cal.*

CABLES, TEMPERATURE RISE IN.

The temperature that ducts and conductors will attain when laid in duct systems in different kinds of earth would be interesting; also the relation of surface temperatures and of the ambient earth temperature to those in the ducts. Research along this line should comprise tests on duct systems having different numbers of ducts well filled with cables which are operating under light, normal and heavy loads. The radiating power of duct structures, surrounded by different kinds of earth or sand, should also be studied at different times of the year. Careful consideration should also be given to the rate at which the temperature drops from the duct structure outward and what effect the street covering has on this gradient. Recently one company lost several cables because the streets were covered with asphalt pavement. On taking up the pavement it was found that the soil around the duct structure was absolutely dry from excessive heat, the asphalt paving having prevented the water from entering the soil around the ducts.—H. W. Fisher, *Standard Underground Cable Company, Perth Amboy, N. J.*

CONDUCTORS, MECHANICAL STRENGTH.

A method of determining the mechanical characteristics of composite strands of cables made up of steel and copper wires of various percentages of the two metals would be valuable. Perhaps the greatest experimental difficulty in testing the samples of cable to be examined would be in providing terminal attachments. They must be such as to avoid having one or more loose wires in a strand when the load is first applied. This would naturally be more difficult the shorter the sample.—H. H. Cochrane, *Montana Power Company, Butte, Mont.*

CONDUCTORS, SKIN EFFECT.

It would be of interest to know the skin effect in a composite strand about 0.4 in. (1 cm.) in diameter, made up of a central steel wire surrounded by three steel wires and three copper wires arranged alternately around the center. This conductor would be used for high-voltage lines of small or medium power capacity, in which the size indicated would be required to avoid corona, but only the copper indicated would be required for conductivity.—H. H. Cochrane, *Montana Power Company, Butte, Mont.*

CONDUITS, HEAT TRANSMISSION.

The thermal resistance of duct lines to dissipation of heat is of considerable importance in determining the temperature rise of cables. Since a study of actual conduits is rather difficult because of the many variables involved, the following method is suggested: Make up from sheet metal small unit-length models of a conduit line and place in a glass vessel filled with an electrolyte to represent the soil around the ducts. Measure the resistance between the duct and surface of the electrolyte which corresponds to the earth's surface. In this way the effect of duct arrangements and conduit depths can be studied and certain constants obtained which would be applicable to actual conduit lines.—Richard C. Powell, *San Francisco, Cal.*

CONSTANTAN.

Relation between the composition of constantan and the stability of its thermal emf. with use under various conditions of oxidizing and reducing gases.—M. E. Leeds, *Philadelphia, Pa.*

CORONA.

The influence of temperature and air pressure on the electric breakdown of air should be known in connection with the use of the corona voltmeter.—J. B. Whitehead, *Johns Hopkins University, Baltimore, Md.*

*The names of individuals given after each institution reporting investigations are those of persons with whom others interested should communicate. All institutions reporting research work should give such names.

GENERATORS, DIRECT-CURRENT.

It would be very desirable if direct-current generators up to 500 kw. or thereabout could be successfully built to operate at 3600 r.p.m. in order to allow direct connection to a steam turbine.—M. D. Church, *Terry Steam Turbine Company, Hartford, Conn.*

INDUCTION GENERATOR, HIGH-FREQUENCY.

A high-frequency generator could probably be built by using an asynchronous machine with a set of condensers. The nature of this device is entirely different from that of the Goldschmidt alternator, since the latter builds upon the reflection principle while in the induction generator an oscillating mutual induction is probably utilized.—August Hund, *Berkeley, Cal.*

LIGHTNING PROTECTION WITH BARBED WIRE.

In place of the ordinary grounding arrangement consisting of heavy copper or iron plates embedded in carbon in damp soil, the author recommends using about 10 m. of ordinary galvanized barbed wire wrapped into a coil about 1.5 m. in circumference. The turns must be placed close to each other so that an electrical discharge could readily jump across. The wire should be placed in vegetable earth, or where some vegetation is planted on top, so that moisture will be assured. The advantages of such an arrangement are large surface, favorable discharge characteristics due to the points, and the absence of a soldered joint. Limited experience seems to indicate that such protection is quite satisfactory, but further and more elaborate tests are recommended.—H. M. Levyier, *Escuela Industrial de la Nación, Buenos Aires, Argentina.*

MAGNETS, PERMANENT.

The influence of heat treatment and of chemical composition of steel upon the characteristics of permanent magnets offers a field for investigation.—M. E. Leeds, *Philadelphia, Pa.*

MALLEABLE IRON, MAGNETIC PROPERTIES OF.

Malleable iron has been used by the writer in the construction of small generators and motors, and, while the permeability is much lower than that of cast steel, being apparently about one-half, yet nearly the same flux density can be used. The material is much cheaper and lends itself much better to machine-shop operations. Malleable iron has been substituted for cast steel in the field frame of a number of starting motors for starting automobile engines without any apparent difference in the characteristics. The writer has never been able to find any considerable amount of data bearing upon this material, and yet the subject seems to be of great commercial importance.—Benjamin F. Bailey, *University of Michigan, Ann Arbor.*

PROTECTIVE DEVICES.

The form of electrostatic field which would break down in the shortest time and over the greatest area would be interesting in connection with the design of protective apparatus. The greater protective value of a sphere gap against over-voltages as compared to a needle gap is due to the fact that the sphere gap has a smaller time lag. An umbrella gap probably has a still smaller time lag because the electrostatic field is more uniform.—Editorial Suggestion.

SURGES IN CABLES AND OVERHEAD LINES.

The following experimental arrangement affords a simple means for laboratory investigation of traveling surges with a steep wave front. Take a single-phase cable or overhead line, a few hundred feet long, and connect one end of it to a source of moderately high direct voltage. Connect to the cable the measuring devices and apparatus upon which it is desired to investigate the action of a surge. Keep the other end of the line open and then suddenly short-circuit it. This will produce a steep wave surge, from the generator out, with all its characteristic phenomena. For example, a wave will jump a spark-gap in series with the conductor rather than go through a low resistance loop shunted across the spark-gap.—Editorial Suggestion.

TELEPHONE, LOUD-SPEAKING.

There is still a wide field for further improvement of loud-speaking telephones and for a scientific study of the best conditions. The hot-cathode amplifier might easily prove to be a useful adjunct in such devices. (The development of corrective devices for the deaf is of particularly practical and humanitarian importance now that many soldiers will soon be returning from the war with their hearing rendered defective on account of the hardships encountered at the front.—Editorial Suggestion.)

TIE-LINE PROBLEM.

The following problem is of interest to operating companies, and it is desired to obtain a solution, analytical, graphical or combined, in such a form that even one not well versed in the intricacies of alternating-current vectors or complex quantities could apply it to his own case. Referring to the accompanying diagram, two substations are fed each with polyphase power

from a station bus through one or more lines in parallel. The combined impedance of the feeders to substation No. 1 is Z_a , of those to No. 2 is Z_b . The loads W_1 and W_2 as well as the phase angles ϕ_1 and ϕ_2 at both substations are given. The feeders to substation No. 2 are overloaded, and it is desired to add a tie-line marked Z_c . The problem is to find the new electrical conditions when the tie-line Z_c is of a given size in operation, or to find the size that would bring about the desired relief. Of particular interest are the currents in Z_b and Z_c . Readers are invited to contribute solutions to this problem.—Editorial Suggestion.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

CHARLES A. COFFIN

HONORED BY FRANCE

Chairman of Board of Directors of General Electric Company Given High Rank of Officer of the Legion of Honor

The French government has conferred on Charles A. Coffin, chairman of the board of directors of the General Electric Company, the rank of Officer of the Legion of Honor. This was done through Justin Godart, formerly Assistant Secretary of War of France, who is in this country on a special mission.

The honor given to Mr. Coffin is in recognition of his services as a member of the executive committee of the War Relief Clearing House for France and as a member of a committee of prominent Americans promoting the establishment of scholarships in French universities for American students after the war.

Mr. Coffin is the only Officer of the Legion of Honor in America.

As is generally known in the electrical industry, Mr. Coffin has given devoted service to the great work of war relief.

ANNUAL MEETING OF SOCIETY FOR ELECTRICAL DEVELOPMENT

Work of the Society to Be Continued for Another Year on Present Basis—"Convenience Outlet" Campaign Planned

The annual meeting of the Society for Electrical Development, Inc., was held on May 14 at the offices in New York. James R. Strong presided.

James M. Wakeman, general manager, read his annual report, reviewing the work during the year and suggesting activities for the coming year. The report of the treasurer, James Smieton, Jr., was read and accepted, together with the auditor's report.

The election of directors resulted:

Representing central stations—J. E. Montague, four years; W. W. Freeman, two years; E. N. Sanderson, one year.

Representing manufacturers—L. P. Sawyer, four years; W. D. Steele, one year.

Representing jobbers—Fred Bissell, four years.

Representing contractors—G. M. Sanborn, four years.

At the directors' meeting which followed, with J. E. Montague presiding, it was decided to continue the work of the society for another year upon the present basis and to conduct a "convenience outlet" campaign as suggested by the general manager. An appropriation was made to carry on the campaign along national lines, similar to the "Wire Your Home" and "America's Electrical Christmas" campaigns.

The society will issue broadsides, booklets, folders, lithographed posters, etc., and will ask local committees to procure the co-operation of the entire electrical industry in educating the public to an appreciation of

"convenience outlets" of all kinds, such outlets to be preferably on a separate circuit from the lighting. It is felt that the time is opportune for such a campaign inasmuch as domestic servants are scarce and people have money to spend upon appliances, the proper use of which plays an important part in fuel conservation.

Henry L. Doherty was again elected president. Joseph E. Montague was elected to succeed W. H. Johnson as vice-president and as a member of the executive committee. Gerard Swope was elected chairman of the executive committee. James M. Wakeman was reappointed general manager and James Smieton, Jr., secretary-treasurer for the ensuing year.

I. E. S. DISCUSSES VALUE OF PROTECTIVE LIGHTING

Chief of Federal Plant Protection Bureau Outlines Its Work and Shows Relation of Illumination to Watch System Used

Some very practical hints regarding the best methods of utilizing artificial illumination to help in the protection of industrial plants against marauders were outlined by Edmund Leigh, chief of plant protection, Military Intelligence Bureau, at the May 9 meeting of the Illuminating Engineering Society held in New York. In discussing the subject of protective lighting he pointed out that very few industrial plant managers know the value of illumination in preventing crime and that they have to be educated as to its proper use. This the plant protection bureau is doing, but illuminating engineers and engineers connected with electric service companies and manufacturers of lighting equipment can help considerably.

Floodlighting produces beneficial results in many cases, but if not properly used it will blind the watchman and defeat its purpose. In many cases considerably better results can be obtained with localized lighting, using deep-bowl reflectors. The best results can be obtained by studying the watch system employed and adapting the lighting system to it rather than vice versa as it is usually done. Silhouette lighting is also very effective, the speaker declared, since long tracts can be guarded in this way without disclosing the position of the watchman. To give an example of how this form of lighting can be used, he referred to experience he had many years ago in guarding the Bowery in lower New York. By standing where he could see a light at the far end of the tract which he had to watch he could see marauders if they stepped between him and the light.

At the McCook aviation test ground very effective protective illumination in the form of searchlamps mounted on sentry towers is employed. Several of these towers are used, the lamps being arranged so they can be easily directed by sentries in the towers.

Mr. Leigh said that whenever the plant protection

branch of the Military Intelligence Bureau cannot cope with a protective lighting problem he calls in illuminating experts.

In the discussion which followed Mr. Leigh's talk the following men took part: George H. Stickney, Mr. Porter, Preston S. Millar and Mr. McGuire.

Mr. Stickney emphasized the need of designing protective lighting systems to fit the method of watch service employed. He also pointed out that lighting mains are often too accessible to persons who might tamper with them.

Mr. Porter had pictures cast on a screen showing different methods of protective lighting. He said that most of these are shown in the booklet which the Illuminating Engineering Society has prepared for the government. One of the principal methods of lighting shown was by means of floodlamps giving a relatively narrow dispersion of rays placed so that the light illuminated a tract parallel to the place that had to be protected. The speaker pointed out that if the dispersion is too narrow a marauder can cross the illuminated space easily and escape in the darkness.

Mr. Millar also referred to the booklet on protective lighting which the Illuminating Engineering Society has prepared for the government.

Mr. McGuire described a protective scheme which he had found very effective. An unclimbable fence was stretched around the building to be protected and the most vicious dogs that could be obtained were turned loose in the space between the fence and the building. Watchmen are stationed at the four corners of the building, and time clocks must be rung one-half minute apart. Thus no watchman can ring for another.

Another speaker called attention to the undesirable use of high-intensity small-spread lamps too close to the ground, saying that lamps of smaller intensity equipped with stippled glass screens to reduce the intrinsic brilliancy of the source are much better. He expressed the belief that the best lighting for railroad yards can be obtained by using deep-bowl reflectors. Flame-arc or incandescent lamps are suitable under such conditions.

Bassett Jones, Jr., also presented a paper entitled "An Instance of Industrial Lighting," in which he explained how to lay out a flexible distribution system for interior lighting.

SECTION FOR HEATING AND CURRENT-CONSUMING DEVICES

Meeting to Be Held on May 28 to Form New Section
of the Associated Manufacturers of
Electrical Supplies

By request of many of the leading manufacturers, a meeting has been called for Tuesday, May 28, at 2 p. m., at the offices of the Associated Manufacturers of Electrical Supplies, New York, to consider the advisability of forming a section in the association to include manufacturers of the various forms of heating and current-consuming appliances for household and industrial purposes.

Such a section has been under contemplation for some time, says Charles E. Dustin, general secretary of the association, and the conditions now seem opportune for accomplishing what it is conceded must be of lasting value to the industry.

HARNESSING THE SOUTHERN RIVERS FOR INDUSTRIAL PURPOSES

The 80,000-hp. development of the Aluminum Company of America at Cheoah, on the Little Tennessee River. The first of a number of hydroelectric stations to be built along that river.

Water-Power Hearings at Washington Concluded

It Is the Expectation that the Special Committee of the House of Representatives
Will Report a Satisfactory Water-Power Bill to the
Present Session of Congress

HAVING heard the various Cabinet members who will constitute the commission on water power proposed in the "administration" bill, and also engineers, financiers and others interested in water-power legislation, the special committee of the House of Representatives will conclude the hearing this week and discuss the matter further in executive session with a view to reporting a workable bill at the present session of Congress.

The Secretaries of War and of Agriculture appeared before the committee on Wednesday and elucidated that portion of the bill dealing with recapture and particularly the part defining net investment. Otherwise they added nothing of importance to the measure, which already embodies their ideas as well as those of the Secretary of the Interior. Senator Thomas J. Walsh of Montana also appeared before the committee on Wednesday to offer two minor amendments, and Representative at Large Frank W. Mondell of Wyoming discussed the various provisions of the bill on Monday. Mrs. H. W. R. Strong of Los Angeles, Cal., asked the committee on Tuesday to exclude from present development the Colorado River in the Grand Canyon of Arizona, preferring that that be made a government reservation until such time as the government itself may choose to dam the canyon and use the electricity for irrigation and other purposes.

STATEMENT OF SECRETARY OF WAR BAKER

Secretary Baker commented on the bill as originally submitted by the three secretaries and also on the effect of the proposed amendments subsequently offered. The latter he said were introduced for the purpose of clarity. His own view is that the terms of the franchises provided for in the "administration" water-power bill shall be definitely limited to fifty years. On this point his testimony was as follows:

"As the bill was originally introduced it was drawn by Secretary Lane, Secretary Houston and myself and represented the consensus of opinion as to what would be desirable in a bill that would meet the views of the legislators who had been considering the subject up to that time. The substitution of the phrase 'net investment,' with a concise and inclusive definition of that phrase, was for the purpose of enabling the committee to consider a bill which had a repetition of that phrase throughout, carrying with it always the identical definition and not requiring the extraction from the body of the bill, in various places, of limitations to be used in determining the recapture price. I thought when I went over it that the phrase 'net investment' as defined here was a clearer definition of exactly the same intention as had been expressed in the original phrases. I do not feel, however, that the adoption of that phrase or that method is at all essential to our concurrence in the bill as originally drafted.

"We have to decide at the outset whether a fixed term

is to be used, at the end of which there is an end of the rights of the licensee, or whether we are going to spread the investment of any licensee over an indefinitely prolonged period under proper safeguards. If it be determined that a single term of fifty years is to be the principle of the bill, then any investor must, whether you provide it in the bill or not, amortize the investment in fifty years. That means that the consumers during the fifty years will have to pay by that much a higher rate than they would have to pay if they covered in their rates merely obsolescence and replacements and did not sink the entire original cost during the period of the grant. If the primary object is to secure a minimum rate to the consumer, the course of having consecutive terms would be the proper course.

"The purpose of this bill was to have a fifty-year term, and at the end of the fifty-year term the government was to have the three options of either taking over the property, granting it to a new licensee or regranting it to the original licensee or his successors in interest. The intention of the bill was to make those three options identical, so far as the financial obligation was concerned. If the government took it over, it would pay *X* dollars; if it granted it to a new licensee, the new licensee would pay *X* dollars; if it regranted it to the original licensee, it would ascertain and fix, as a new starting point for his net investment, *X* dollars, the same number of dollars in each instance. The purpose of the bill, as originally drawn, I think—and certainly as clearly shown by the amendment—was not to sink and amortize the original cost during the first term, but to carry that investment—depreciate it so that at any particular period of renewal it represented the actual value—to carry that forward as a continuing asset in the licensee, either to be repaid to him by any other licensee or by the government or to be regarded as his investment at the beginning of the new license period.

"Now, my own judgment, my very strong preference, is for the first of those courses, to fix an absolute term and to allow the government not to have a system of equities built up against it at the end of that term. If that were done, it would cost more to the consumer clearly, but if it is intended to do that, it ought to be so clearly done that when the first term or first license does expire, there will not be any doubt that the government has a right to expect the licensee to have protected himself by amortization during the period.

GOVERNMENT CONTROL OF INTRASTATE RATES

"Now, there is one other point that has been raised here upon which I want to say a word, and that is the question as to whether or not it would be possible to put in this bill the control of rates by the federal government on *intrastate* business of such a character as to assure the building up of an amortization fund. I am not prepared to express an opinion on that subject

as a lawyer, but I remember a somewhat similar case to which I would call attention.

"In the State of Ohio a telephone company made a contract with the city of Toledo whereby the company got a franchise to operate telephones in that city and agreed to charge a stipulated rate for domestic and business telephones. After it had constructed its plant it started to charge a much higher rate for both business and domestic telephones. A suit was brought, I think, in quo warranto, for abuse of franchise, and it was decided in the Circuit Court in Ohio that the power of the city of Toledo in the matter of the granting of a telephone franchise was not to make a contract with regard to rates but merely to determine whether in the public interest the public highways might properly be used for the erection of telephone poles and wires, and that therefore the subject of rates was outside of the purview of the contracting power of the city and the telephone company; that it must be assumed that the subordinate governmental agency had correctly decided the convenience of the government in allowing the erection of these facilities, and that its attempt to inject into that decision a contractual relation with regard to a subject matter where it was not authorized to contract was ultra vires and entirely nugatory, and that the company could continue to enjoy the grant of the right to occupy the streets without being bound by the obligation as to rates. That is the case of McMahon against the Home Telephone Company, and it is the Circuit Court's decision, but it was afterward affirmed by the Supreme Court.

"Now, if the federal government dealing with public lands and the public forests has a different kind of right from that which it has in dealing with navigable rivers, and its contract with a licensee proceeds in the one case from a proprietary interest which might be made the basis of a contract, where in the other case it is exercising a governmental power of regulation, it might well be that a provision in this act authorizing the fixing of rates in intrastate business would be upheld with regard to the public lands and the public forests, where it rested upon a proprietary interest in the government as a contracting party, and not upheld with regard to navigable streams, where the basis of the power is the regulation of the streams in the interest of navigation. I simply cite that as being a difference which may arise. In my own judgment, if the term is fixed definitely at fifty years and there be either an explicit statement or so plain an inference in the bill that the rights of the licensee then terminate, you will force both upon the licensee and upon any local regulating body the obligation of including in the rate a sum which will provide for amortization. In other words, I think the courts would enjoin, as confiscatory, any rate which was sought to be imposed upon a public utility living under the definite and fixed term 'grant,' with no equities of renewal, a rate which did not authorize it to collect enough to pay its running expenses and amortize the investment during the period of the grant."

WHAT CONSTITUTES FAIR VALUE

Secretary of Agriculture Houston, in discussing net investment as defined in the amended measure, said

that the original draft of the bill provided for recapture of the water-power development at fair value. In suggesting the term "net investment" as the basis for payment it was thought it would not be susceptible to any misunderstanding or misinterpretation inasmuch as the term was specifically defined. However, it is inconceivable that there should be any unappropriated surplus to deduct from the original cost as required in the measure (see ELECTRICAL WORLD, March 16, page 581), and for that reason he suggested the following amendment to the clause on "net investment" as defined in the amended measure or to "fair value" as understood in the original draft:

"That out of surplus earnings, if any, accumulated in excess of a specified rate of return upon the net investment of the licensee in any project or projects under license the licensee shall establish and maintain amortization reserves, which reserves shall, in the discretion of the commission, be held until the termination of the license or be applied from time to time in reduction of the net investment. Such specified rate of return and the proportion of such surplus earnings to be paid into and held in such reserves shall be set forth in the license."

Should the government at the end of the fifty-year period take over the project that sum would be deducted from the original cost. Whether or not to make amortization within the fifty-year period compulsory was a question of policy for the committee to decide. To do so would mean higher rates for the electric service during the life of the franchise, which the utility has a perfect right to exact.

OPINIONS OF CONGRESSMEN

Representative Ferris gave as his opinion that the term of the lease should be definitely fixed at fifty years and that the government should not be required to pay back every cent put into a project. Secretary Houston was, however, in favor of succeeding terms under proper regulations and safeguards and on terms which would be reasonable under the conditions then existing. He also was of the opinion that one body should treat all water-power matters including boundary waters covered by treaty.

It was the opinion of Representative Mondell of Wyoming that a good right-of-way measure would be preferable to the present water-power bills since most of the water powers are on non-navigable streams. He was not in favor of a recapture by the government because it fixed a time at which investment values would be disturbed, and this had to be taken into consideration in fixing a rate. What is needed, he said, is the largest possible development under the best economic conditions, best management and lowest rates. He was glad to note the change of attitude on the part of the government toward electrical developments. Monopoly was now sought where a few years ago reports were issued against combinations and monopolies in water powers. The business, he said, was now recognized as being essentially monopolistic and all the government should do is to hold electrical enterprises in absolute public control as to rates and practices. Without a recapture clause the federal charge can be adjusted from time to time. The government, he maintained, has no values to give to any one in connection with water-power developments.

The return allowed can be secured by any one without the least effort by merely buying a bond.

The amendments offered by Senator Walsh called for the advertising of one's intention to apply for a license, giving the location of the works and the public lands to be occupied, and provided that preference be given to the applicant offering the best terms to the public.

The final hearings in the closing days of the present week were held after this issue of the ELECTRICAL WORLD had gone to press. A further report will be published in next week's issue.

"MAXIMUM PRODUCTION WITH MINIMUM WASTE"

Large Scope of the Fuel Administration Plan for Conservation in Power Plants Through Personal Inspection of Every Plant

Announcement of the appointment by the United States Fuel Administration of an administrative engineer for the Pittsburgh district as part of a general plan for fuel conservation in power plants was made in the ELECTRICAL WORLD of May 11, 1918, page 992. Thomas R. Brown is appointed administrative engineer for the Pittsburgh district and C. P. Billings special staff assistant.

This plan is the result of conferences with the federal fuel administrators and their committees for the group of states which together consume about 70 per cent of all the coal used in the United States, exclusive of railroads. The plan has received the indorsement of the fuel administrators of all these states, as well as approval of the United States Bureau of Mines and a committee representing the Engineering Council of the four national engineering societies.

The slogan of the campaign is "Maximum production with minimum waste." In other words, the object is to operate all industries at full capacity, but at the same time to make a pound of fuel perform its maximum service in power, light and heat.

In laying the foundations for the organization it has been anticipated that this work should become a permanent service of the government.

The expectation of the Fuel Administration is that from 10 to 20 per cent—that is, from 25,000,000 tons to 50,000,000 tons of coal per year—can be saved by the correct operation of steam-power plants, using their present equipment, in the industries, in office buildings, hotels, apartment houses, etc.

It is considered most important that all existing fuel-conservation committees, committees of chambers of commerce and national defense, manufacturers' associations and other bodies be continued in full force, and that the work of such organizations be consolidated with the national program, which comprises certain fundamentals, as follows:

1. Personal inspection of every power plant in the country.
2. Classification and rating of every power plant, based upon the thoroughness with which owner of said plant conforms to recommendations.
3. Responsibility of rating the plants will fall upon an engineer in each district, the rating to be based upon reports of inspectors, who will not express opinions, but will col-

lect definite information. The state fuel administrator, in his judgment, may entirely or partially shut off the consumption of coal to any needlessly wasteful plant in his territory.

4. Inspectors are to be furnished from one or more of the following sources: (a) Inspectors of the steam-boiler insurance companies; (b) state factory inspectors; (c) engineering students from technical colleges; (d) volunteers.

The ratings will be based upon recorded answers to questions, each of which will be given a value depending upon its relative importance to the other questions. Depending upon the efficiency of methods in use in any plant, it may be rated in class 1, 2, 3 or 4.

The ratings will be based upon existing equipment. The difficulty, delay and expense involved in the installation at this time of improved power equipment is fully recognized, but experience has proved, in the judgment of the Fuel Administration, that 10 to 20 per cent of fuel now used in power plants can be saved by improvements in operation alone.

In advance of the first inspection a questionnaire will be sent to every power plant in each district, with notice to the owner that within sixty or ninety days his plant will be inspected personally and the questionnaire will be checked up by the inspector upon his visit. This action will tend to prepare the minds of plant owners for what will follow. It will operate to induce proper care in furnishing information and will also tend to produce a desire to improve their plants, if necessary, so that they may be rated in a high class by the time the inspector calls upon them.

COLLECTING WAR DATA FOR N. E. L. A. CONVENTION

Information Sought from the Companies as to Employees in Service, War Loans, War Savings Stamp Activities, Etc.

Secretary T. C. Martin of the National Electric Light Association, writing to electric light and power companies, says that in connection with the thirty-fourth annual meeting of the association, to be held at Atlantic City on June 13 and 14, it is desired to present definite data bearing upon the direct relations of the electric light and power industry to national service in the various forms that represent contribution toward winning the war. It is known in a general way, he says, that, "as was to be expected, the response of our group of public utilities to all patriotic and philanthropic appeals has been both prompt and generous, but no details exist as to present conditions and results.

"The value and need of such information is obvious, and I have been instructed by President Lieb to make this effort to secure it, with the request that you will immediately co-operate with us. The belief is entertained that each company has in its possession already information of the kind sought, as proved by the inquiry made by us at the time of the first draft in regard to its effect on the man power of the industry."

Data are specifically requested as to four main items: (1) Number of employees in all the armed forces of the nation; (2) contributions to war loans; (3) war savings stamp activities; (4) Red Cross work and allied patriotic philanthropy.

Already returns are being received at the association offices, and some of them are surprisingly large.

SEEKS TO POSTPONE RATE CASE UNTIL TERMINATION OF WAR

**Edison Electric Illuminating Company of Boston
Makes Earnest Effort to Convince Commis-
sion that This Would Be Right**

A vigorous plea on behalf of postponement until the end of the war of the pending general inquiry by the Massachusetts Gas and Electric Light Commission into the rates of the Edison Electric Illuminating Company of Boston was made May 9 by F. M. Ives, counsel for the company. The board was hearing the petition of Granville S. MacFarland of the Hearst publications for a rate investigation on the Boston system, when Mr. Ives requested that the whole matter be tabled without prejudice during the remainder of the war. After listening to the company's side and reserving an opportunity for President C. L. Edgar to make a statement later, the commission adjourned the hearing to May 13, when the petitioners were to reply to the suggested postponement.

THE REASONS FOR POSTPONEMENT

The company assigns as grounds for its motion three reasons:

The improbability of the commission's recommending a general decrease in rates or a revision of schedules at this time, and the much greater probability of the necessity of an increase in rates if the company is to continue an efficient servant of the public.

The fact that the company has neither the time nor the funds necessary for a proper preparation of the case, either in getting at the facts which the petitioners desire or for a proper presentation of its own case.

The futility of an investigation of the facts upon which a proper measure of the rates should be based when the facts are changing daily.

The Boston Edison company finds itself in the same predicament as other companies in the same field. It has already felt obliged to add to its rate a coal clause designed to collect from all its customers the exact increase of the cost of coal above the cost in normal times. So far this coal clause has not been applied to the maximum rate, with the result that the company is not collecting anything like the increased cost of coal. The company foresees the time when the coal clause must be applied to the maximum rate, and if conditions do not change for the better, it seems inevitable that a general increase in rates will be necessary. The amount written off for replacements last year exceeded \$200,000 transferred to the reserve fund for that purpose.

As a result of the street-lighting decision the company has been obliged to pay back to the city of Boston for the period from December, 1914, to February, 1918, both inclusive, almost \$150,000. By agreement with the city the company is paying this in ten monthly installments, paying interest on the installments from March 1. The new street-lighting rates have been made effective all over the system, with a reduced income of from \$50,000 to \$60,000 per year. Lightless nights during January, February and March and heatless and workless days during the same period still further reduced the income by some thousands of dollars. The Boston company now estimates that daylight saving will reduce its income at least \$250,000 a year.

Last week a general increase of 10 per cent was

granted in the wages of all employees earning \$3,000 or less, a concession which will cost the company at least \$200,000 a year. Increases in the cost of coal, a small percentage of which is compensated by the coal clause, amount now to \$1.65 per ton (55 cents on the coal price and \$1.10 on the transportation) above the price paid in the fiscal year 1917, and the company burned 225,000 tons in that year. The consumption has since increased and further advances in coal cost may be expected, together with higher prices on materials for repairs and renewals. The \$875,000 available in 1917 for depreciation and surplus looks small in the face of 1918 requirements and will virtually disappear in 1919 if the war continues and rates are not increased.

Mr. Ives pointed out that there is a severe shortage of the men needed to prepare a rate case properly. Prof. D. C. Jackson, who has been at work on this case for the company for several months, has been summoned by General Pershing to France, and the government has commissioned W. B. Jackson, his partner, withdrawing him from private practice. The company's own officers are so occupied with work of public concern that little time is available for other than routine business. President Edgar's service on committees, important not only to the industry but to the government, requires his attendance in New York or Washington two or three days in every week, leaving him little time for other than routine affairs, many of which are unusual in scope.

Conditions are far from ordinary. Costs are changing daily, and the only inference which can be drawn from past costs is that they will be higher to-morrow if the war continues, Mr. Ives states.

THE SERIOUS FUEL SITUATION

The company has a contract for transporting coal from Hampton Roads to the boiler room at South Boston at 95 cents per ton. This has already been increased to \$2.05, and the company has conceded that a further increase not yet settled is to be met. If the government should withdraw the boats it has already requisitioned, there is a probability of having to pay the government rate, which is \$3.23 for freight alone from Hampton Roads to South Boston. It is said that this rate has now been raised to \$3.50. In February, when the supply was low, the company paid about \$9 per ton for a cargo of coal at the wharf bought outside the contract. If the coal shortage continues, as seems more than likely, there will be more than a few months of lightless nights and heatless and workless days next winter, with a resulting loss of income. If the government continues giving in to the ever-increasing demands of labor, the company will be forced to make further increases in wages. To-day 310 employees are with the colors.

In closing, Mr. Ives said: "The company has to face the very serious problems caused by the existing ever-changing conditions, due to the most stupendous war in the history of the world—problems which are the most serious in the experience of the company. It asks that it be permitted to attend to their solution, untrammelled and unimpeded by proceedings to reduce its rates instituted when conditions were normal and before a war in which the United States might take so important a part was thought of."

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Engineers' Club of Columbus.—At a recent meeting of the Engineers' Club of Columbus, Ohio, E. G. Bradbury was chosen president and E. G. Morris secretary.

Engineers' Club of Trenton.—On May 9 J. B. Scott of Day & Zimmermann, Inc., addressed the Engineers' Club of Trenton, N. J., on the new power plant of the Erie Lighting Company, at Erie, Pa.

Louisiana Engineering Society.—T. F. Carlisle, British Consul, delivered an address on "Britain and the War—The Last Twelve Months," before a meeting of the Louisiana Engineering Society, New Orleans, on May 13.

A. I. and S. E. E., Cleveland Section.—The Cleveland Section of the Association of Iron and Steel Electrical Engineers will hold its next meeting on May 25 at the Hotel Statler. A. E. Hogrebe will deliver an address on "Electric Cranes."

A. I. E. E., Schenectady Section.—"The Romance of the Pictures" was the subject of an address by C. Francis Jenkins, president of the Society of Motion Picture Engineers, before the May 10 meeting of the Schenectady Section of the American Institute of Electrical Engineers.

Detroit Engineering Society.—At a recent meeting of the Detroit Engineering Society Charles Dixon was elected president. At the May 3 meeting of the society Robert H. Kuss, consulting engineer, Chicago, spoke on the subject of "Coal Conservation as Applied to Boiler-Room Operation."

Society for the Promotion of Engineering Education.—"The Engineering School and the War" will be the subject of a discussion at the twenty-sixth annual meeting of the Society for the Promotion of Engineering Education, to be held at Northwestern University, Evanston, Ill., June 26-29.

Engineering Club of Des Moines, Iowa.—Engineers have banded together in Des Moines, Iowa, and have formed the Engineering Club. The membership includes practicing engineers, graduate engineers and non-graduates who are engaged in engineering work. The first officers are A. W. Lee, president, and Monroe L. Patrick, secretary.

I. E. S., Philadelphia Section.—"The Relation of Light to Health" was the subject of a paper read by Dr. C. E. de M. Sajous before a joint meeting of the Philadelphia Section of the Illuminating Engineering Society and the Philadelphia Safety Council on May 17. Howard Lyon also gave a short talk on "Methods of Calculation."

Jovian League, Atlantic City, N. J.—A chapter of the Jovian League has been established at Atlantic City, N. J., with A. J. Purinton as president and H. C. Stockinger as secretary. The league will hold meetings on the first and third Mondays of each month.

N. E. L. A., Iowa Section.—The date of the convention of the Iowa Section of the National Electric Light Association has been changed from May 22 and 23 to May 31 and June 1. The program is as follows: Discussion of the labor situation by T. Crawford, Clinton, Iowa; discussion on isolated plants by Austin Burt, Waterloo, Iowa; discussion on rate increase by F. A. Warfield, Peoria, Ill.; discussion on the coal situation by F. W. Linebaugh, Boone, Iowa; discussion on boiler-room economy by E. S. Hight, Peoria, Ill.

Missouri Association of Public Utilities.—The annual convention of the Missouri Association of Public Utilities is meeting at St. Joseph, Mo., May 17 and 18. The program is as follows: P. J. Kealy on "Work of National Utilities Association"; H. Wurdack, "How War Conditions Have Affected the Utilities of the State and the Nation"; J. S. Tritle, "Problem of Manufacturing Under War Conditions"; H. Spoehrer, "Taxes Affecting Public Utilities." According to an announcement of the convention issued by F. D. Beardslee, St. Louis, secretary-treasurer, the Fuel Administrator of Missouri will also address the convention.

National Electrical Credit Association.—The nineteenth annual meeting of the National Electrical Credit Association will be held at the La Salle Hotel in Chicago on June 17 and 18. The National Association of Credit Men will also hold its annual meeting at the Hotel La Salle June 18 to 21 inclusive. President W. T. Pringle of the Pringle Electric Manufacturing Company of Philadelphia will preside at the electrical credit men's meeting, and the program will be conducted under the supervision of M. A. Curran, Western Electric Company, New York, as chairman of the committee on arrangements, and H. E. Wilkins of the Belden Manufacturing Company, Chicago, chairman of the local committee of entertainment.

Arkansas Association of Public Utility Operators.—The important papers to be presented at the eleventh annual convention of the Arkansas Association of Public Utility Operators at the Arlington Hotel, Hot Springs, on May 21 and 23 inclusive, will be as follows: William Crooks, engineer Arkansas Light & Power Company, "Transmission Line Construction"; J. F. Christy, manager Jonesboro Water & Light Company, "Present-Day Fuel Situation"; A. Patterson, superintendent electric department Southwestern Gas & Electric Company, "War-Time Costs Versus Rates"; W. R. Herstein, Electric Supply Company, Memphis, Tenn., "Courteous Attention to Traveling Salesmen." W. N. Gladson, dean of the College of Engineering, Arkansas State University, will also deliver an address.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

To Improve Trade Statistics for War Work.—With the immediate object of furnishing more detailed and accurate information for the war boards engaged in licensing imports and exports and conserving tonnage, foodstuffs and raw materials, a radical revision and extension of the government's foreign trade statistical classification has been undertaken by the Bureau of Foreign and Domestic Commerce, Department of Commerce. To this end the business public is urged to make immediate suggestions as to new classes of goods that ought to be shown in the trade statistics or new subdivisions of the present classes. Although the present need for more specific statistics is largely brought about by the war, the bureau desires to make the statistics of the largest possible permanent value in its work of promoting foreign commerce after the war. The Tariff Commission, the Food Administration, the War Trade Board, the Shipping Board and other war organizations are co-operating with the bureau in the effort to obtain a more detailed classification and will take measures to insure compliance with the officially issued regulations.

Higher Rates Sought in Kansas City, Mo.—The Kansas City Light & Power Company is preparing to make application to the Missouri Public Service Commission for readjustment of schedules. The commission is now securing material on the company's costs of operation and revenue, in view of the fact that the schedule indorsed by it in 1917 was to be operative only until April 30 this year. The Kansas City Railways Company has asked the commission to increase the rate charged by it to the Kansas City Light & Power Company for energy from around 1 cent per kilowatt-hour to a figure that will provide at least for cost. It is expected, according to Kansas City advices, that the commission will grant such an increase, possibly of four-tenths of a cent or thereabouts, which would involve an additional annual expense to the light company of about \$350,000. It is also possible that the commission may make the increase retroactive or may require the payment of a lump sum. If the increased rate is granted, effective from Jan. 1 this year, and a lump sum of \$100,000 or more is granted for making up deficiencies of the rate during 1917 and previously, these costs, with the increased expense of wages and coal, would mean a burden of around \$700,000 on the light company this year, which the schedules would have to take care of, at least in part.

Arthur E. Smith has resigned as commercial manager of the Little Rock (Ark.) Railway & Electric Company to enter the automobile business in Little Rock.

P. W. Campbell has been transferred from the Henryetta (Okla.) Electric Light Company to act as manager of the Stamford (Tex.) Gas & Electric Company.

D. F. Radsloff, chief engineer of the Northern States Power Company, Grand Forks (N. D.) division, has entered the Thirty-fourth Engineering Regiment at Wrightstown, N. J.

Robert A. Wood has resigned as new-business manager of the Brush Electric Company, Galveston, Tex., to take charge of the Christian Science army camp work in Texas.

A. L. Martin, manager of the Oregon Power Company, Marshfield division, has been elected a member of the board of directors of the Marshfield Chamber of Commerce for the ensuing year.

J. C. Breeding has been transferred from the Stamford (Tex.) Gas & Electric Company to the Longview (Tex.) Ice & Light Company to act in the capacity of manager, succeeding W. B. McNaughton, resigned.

Paul J. Hayes, formerly manager of the Texas Public Service Company of Vernon, Tex., has been appointed manager of the Henryetta (Okla.) Electric Light Company and the Henryetta Ice & Cold Storage Company.

G. C. Marshall has been transferred by the American Gas & Electric Company from the Newark office of the Ohio Light & Power Company to the Steubenville (Ohio) office of the Ohio River Power Company as commercial manager.

George M. Keenan has been appointed superintendent of the railway power plant of the Little Rock Railway & Electric Company. This appointment was called for by the resignation of A. W. Russell, formerly chief engineer of the power house.

V. L. Blanchard, who has been a special representative of the new-business department of the Toledo Railway & Light Company, has returned to the Brush Electric Company at Galveston, Tex., as new-business manager, succeeding Robert A. Wood, resigned.

A. P. C. Schramm, who for the last five years has been the chief engineer of the Klaxon Company, Newark, N. J. has established himself as a consulting engineer at 276 Canal Street, New York City. His work embraces electrical, industrial and efficiency engineering.

J. C. Chestnut has resigned as superintendent of the New Castle (Pa.) Electric Company, a subsidiary of the Mahoning & Shenango Railway & Light Company, to become general manager of the Choctaw Power & Light Company, McAlester, Okla. Mr. Chestnut has been superintendent at New Castle for the past four years, prior to that having been superintendent of the Shenango Valley Electric Light Company at Sharon, Pa.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

A. G. Carson has resigned from the managership of the Eastern Wisconsin Electric Company at Fond du Lac to become associated with the C. C. Smith interests in Wisconsin.

F. E. McKenna, formerly superintendent of the Oregon Power Company at Coquille, has been transferred to Marshfield as general superintendent for the Coos Bay division of the Oregon Power Company.

C. J. Cooper, Jr., who until recently has been assistant general manager of the Merchants' Heat & Light Company, Indianapolis, Ind., has been made general manager of the Mineral Point Public Service Company, Mineral Point, Wis.

M. H. Frank has been appointed manager of the Eastern Wisconsin Electric Company at Fond du Lac, succeeding A. G. Carson, resigned. Mr. Frank, who is a graduate of Purdue, was previously with the Galesburg (Ill.) Railway, Lighting & Power Company.

F. T. Morrissey has been appointed electrical engineer for the Indiana Railways & Light Company, Kokomo, Ind., to fill the vacancy made by the resignation of George H. Losey. Mr. Morrissey was formerly manager of the Eldorado (Ill.) group of properties owned and operated by the Southern Illinois Light & Power Company.

H. W. Derry has resigned as contract agent of the Pittsfield (Mass.) Electric Company to take charge of the motor sales department of the Hartford (Conn.) Electric Light Company. Mr. Derry has been associated with the Pittsfield company for the last five years, having been in the employ of the Westinghouse Electric & Manufacturing Company previously.

L. R. Dutton, manager of the Jenkintown division of the Philadelphia Suburban Gas & Electric Company, has been granted leave of absence by the company from May 1, to engage in war welfare work in connection with the military training camps. Mr. Dutton has been appointed to a secretaryship of the Y. M. C. A. at the base hospital at Camp Dix, Wrightstown, N. J.

Dr. Addams S. McAllister has gone to Washington, D. C., as assistant to Major Thompson in the progress section of the Control Board of the Ordnance Department. Prior to going to Washington Dr. McAllister had been very active in New York in engineering society committee work relative to war matters—among other things, obtaining for the government engineers with qualifications required for particular war operations.

E. G. Holzer, who for fifteen years has been manager of the Easton Gas Works, has been appointed manager of the Jenkintown division of the Philadelphia Suburban Gas & Electric Company during the absence of L. R. Dutton, who has gone into war welfare work with the Y. M. C. A.

M. W. Arthur has resigned from the Westinghouse Electric & Manufacturing Company to accept a position as superintendent of sales for the Northern Ohio Traction & Light Company of Akron. Mr. Arthur for seven years has been connected with the railway and power department of the Westinghouse company at Cincinnati.

C. L. Proctor, who has been new-business manager of the Empire District Electric Company at Joplin, Mo., has been made general manager of the Danbury (Conn.) & Bethel Gas & Electric Light Company, succeeding the late Charles H. Merritt. Mr. Proctor before going to Joplin three years ago was for six years general superintendent and purchasing agent for the Athens (Ga.) Railway & Electric Company.

C. M. Brewer, manager of the Richmond (Cal.) division of the Western States Gas & Electric Company, has been appointed a member of a committee organized for the purpose of assisting the Industrial Commission in effecting a suitable building and loan plan to increase the residences in Richmond. Mr. Brewer has also been made a member of the executive board of a newly organized war body to be called "Community Council for War Work."

Ralph W. E. Donges, president of the Board of Public Utility Commissioners of New Jersey, has been commissioned a lieutenant-colonel in the National Army. Governor Edge of New Jersey has requested Secretary of War Baker to permit the continuance of Mr. Donges' commissionership until pending important rate cases are decided. Lieutenant-Colonel Donges has been a commissioned officer in the New Jersey National Guard for the last seventeen years. He has been a member of the State board since 1913, when he was appointed by Woodrow Wilson, then Governor.

Obituary

Arnold von Siemens of Siemens & Halske died last week at the age of sixty-five years, according to a press dispatch from Berlin.

Frank E. Getts, general manager of the Electrical Engineers' Equipment Company, Chicago, died May 7 in Los Angeles, as the result of overexertion, which caused an artery near his heart to burst. Mr. Getts had become well known in the electrical industry through his connection with the Siemens-Halske company for five years and the General Electric Company in the turbine department for fifteen years. At one time Mr. Getts was in charge of the turbine business of the General Electric Company in the Chicago district.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

STANDARD PACKAGES IN CERTAIN LINES OF ELECTRICAL GOODS

The Advantages and Convenience of the New System
—Various Branches of the Trade Are
Now Considering the Change

For some months there has been considerable attention given to the matter of the number of pieces in standard packages. There is now no general system. Some members of the trade incline toward the dozen system, while others are in favor of the tens system.

The former argue largely from the ease with which the dozen lends itself to packing. It has the four and three combination. Those in favor of the tens method point out the ease of thinking in units of ten. Where ten will make packing difficult they use a multiple of ten. This is their way out. Furthermore, that the inclination of American trade is more and more toward the use of the metric system is an argument made in favor of the tens system.

In this connection one company, the Bryant Electric Company, has already established new standard packages. The following quantities now prevail in standard packages in the Bryant line: 250 keyless socket body, 250 pendent cap, 100 $\frac{1}{8}$ -in. cap, 100 $\frac{1}{4}$ -in. cap, 100 $\frac{3}{8}$ -in. cap, 100 $\frac{1}{2}$ -in. cap, 100 $\frac{3}{4}$ -in. angle cap, 100 $\frac{1}{2}$ -in. angle cap, 100 molding base, 100 $3\frac{1}{4}$ -in. box base, 100 4-in. box base.

MANUFACTURERS AND JOBBERS REPORT INCREASING BUSINESS

Southeastern Trade's Volume of Buying Indicates
Value per Order on Higher Level—
Status of Trade Acceptance

For the last two years, and during 1917 and up to the present time especially, the manufacturers represented in the Southeast, together with the jobbers, have enjoyed a large volume of business; and underlying indications point to a continuance of these conditions, with the possible exception of a marked cessation in central-station purchases. The latter are more than offset, however, by substantial buying for government account. Previous to 1917 the dealers and jobbers bought, in a measure, from hand to mouth, and along the entire line the value per order was small compared with the same value to-day. While sporadic large orders created spotty increases in these values, nevertheless the general average was comparatively low. Data at hand indicate that the value per order is increasing daily.

Utilizing 100 as a base or index figure representing the value per order for 1916, the indices for 1917 are 140 for manufacturers and 125 for jobbers. The last three months of 1917 indexed 180 for manufacturers' sales and 150 for jobbers'. From meager information the index figures for 1918 to date are: Manufacturers, 184; jobbers, 156. The greater portion of increase in these index figures is due to the fact that prices enhanced rapidly in many lines during 1917, but there are several other potent factors that have tended to boost these figures.

Dealers are buying larger quantities through the jobbers, because a smaller number of salesmen are traveling. Salesmen do not call as frequently, and then, too, dealers realize that the man with the goods secures the business. This feature alone makes for larger individual orders, which in part precludes future difficulties in transportation. Moreover, the same reasons for increased index figures are applicable to the manufacturers, as the jobbers are buying in large lots, being actuated by the same motives that influence

the dealers and retailers, combined with some pressure and wholesome advice from manufacturers.

It can hardly be said that the adoption of the trade acceptance has affected the index figures, but it may be of interest along this line to state that the acceptance is being received with more favor throughout the industry. A preliminary canvass shows that while a few manufacturers are suggesting this class of paper to jobbers, others are "staying off" awaiting the trend of activity in this channel. For a time the jobbers were paying very little attention to the acceptance, but of late it has come into wider use. At the present time there is slight opportunity for the contractor to utilize this paper, owing to the fact that his accounts are harder to take care of in this manner.

SELLING TRADEMARKED GOODS IN LATIN-AMERICAN COUNTRIES

Director Appointed by Treasury Department at
Havana—Long-Established Abuses in Connection
with American Brands to Be Eliminated

Manufacturers and exporters selling trademarked electrical goods in foreign countries, particularly South America, may be interested in these few important facts: (1) In Argentina, Bolivia, Chile, Costa Rica, Cuba, Guatemala, Paraguay, Peru and Venezuela trademark titles absolutely depend upon priority of registration. Furthermore, any one may lawfully register a United States trademark (registered or unregistered) and thus prevent entry of the goods into the country. (2) In Brazil, Cuba, Guatemala and Panama the trademark must be registered in the United States Patent Office before it can be registered in these countries. (3) In Ecuador, Mexico and Nicaragua no suit may be brought for infringement of a trademark without registration. (4) It is said on good authority that enemy belligerents are now registering United States trademarks in countries mentioned in clause (1) through "dummies." The result is obvious: manufacturers who anticipate exporting trademarked products will find themselves blocked in their effort to do so.

At the fourth Pan-American Conference, held in Buenos Aires in 1910, a convention was adopted which provides that "any mark duly registered in one of the signatory states shall be considered as registered also in the other states of the union, without prejudice to the rights of third persons and to the provisions of the laws of each state governing the same. In order to enjoy the benefit of the foregoing, the manufacturer or merchant interested in the registry of the mark must pay, in addition to the fees or charges fixed by the laws of the state in which application for registration is first made, the sum of \$50 gold, which sum shall cover all the expenses of both bureaus for the international registration in all the signatory states."

In the administration of this provision two bureaus for the registration of trademarks were to be established. The twenty-one republics forming the Pan-American Union are divided into two groups, with Havana as the center for the countries of North and Central America and the West Indies, and Rio de Janeiro as the center for the South American countries. Either bureau may be established upon the ratification of the convention by two-thirds of the countries of the respective groups. The necessary number for the establishment of the bureau at Havana were secured in August, 1916. At present Mexico, Salvador and Haiti are the only countries of the northern group that have failed to ratify the convention. Dr. Mario Diaz Yrizar has been appointed director of the bureau at Havana.

LEADING FAN MANUFACTURERS NOW POSITIVE OF SHORTAGE

Government Requirements Are Exceeding All Calculations—Selling Season Is Well Advanced and Business Is in Full Swing

So far it now seems certain that in the Eastern section of the country a shortage of fans is unavoidable. This is the opinion expressed by several leading manufacturers in reviewing current conditions and immediate prospects. Following what was stated in the ELECTRICAL WORLD of April 27, page 900, and with the premature opening of the retail selling season, two months earlier than usual, producers are more positive than ever that a shortage is in sight.

One manufacturer, conspicuous for his company's large output and important distributing connections, stated this week as an instance of the unusual, if not unprecedented, demand for fans that his concern had just received inquiry for 2000 to 3000 fans from a United States medical base and another from the government concerning the equipment of one of the biggest cantonments. Further, he said that if all the cantonments ordered on similar specifications, which is more than likely, these requirements alone would be sufficient to absorb the entire stock of fans in the country.

Shell-loading plants, a new source of distribution, are in the market for liberal quantities of fans. These buildings are hastily constructed in connection with powder and explosive factories, and if other establishments of this kind, complete and in course of construction, make similar requirements, the supply will be again heavily drawn upon. If government orders so far received are followed by others of the same proportion, it seems likely that fans must necessarily be rated as essential war merchandise.

The manufacturers are of one mind. They are equally emphatic regarding the threatened scarcity. One of the Western producers with important Eastern connections stated that up to date his sales to the close of April were equal to what were usually reached in June. Of course, it was stated, prices are fixed and will not be disturbed, but they in no way are binding on the dealer.

METAL MARKET SITUATION

Official Price of Copper Still in Abeyance—Scarcity of Tin Causing Concern

Some manufacturers and jobbers of electrical staples and wire products are positive that copper will be placed on a higher official price level June 1. With this belief increases in the cost of finished goods are spoken of as assured. Nevertheless, the War Industries Board has come to no decision, though a number of conferences have been held to discuss the matter. Metal market authorities are equally certain no change will be made. Tin is occupying more attention than copper, its scarcity inducing the government to inquire into conditions. The increasing shortage and high prices are causing acute concern in the electrical trade.

NEW YORK METAL MARKET PRICES

	May 6			May 13		
	f	s	d	f	s	d
Copper:						
London, standard spot....	110	0	0	110	0	0

*No Straits offering. †In 50-ton lots: carload, 32.10 cents per lb.; 10-ton to 14-ton lots, 32.20 cents per lb.

THE WEEK IN TRADE

NO UNFAVORABLE reports concerning general business in the electrical trade have been received in the past week. On the contrary, sales have increased in volume and value, and, on the whole, a more cheerful aspect is noticeable in every section. Jobbers' stocks are in better shape, far-sighted buying, predicated on a belief in the underlying soundness of commercial affairs, being responsible. Dealers are also anticipating their requirements and making needful preparations for future demands by the consumer. In some parts of the country it is estimated that the volume of trade is 50 per cent ahead of last year, and would be still greater if the shortage of labor had not curtailed production and hampered work in which electrical equipment would have entered largely.

Price advances of a substantial nature are said to be about ready for announcement in schedule material, porcelain goods, etc. Lamp stocks are now well distributed, and even an accumulation is mentioned in some places heretofore complaining of a shortage. Conduit is yet difficult to obtain in quantity. Domestic items, such as sewing and washing machines, ironers, flatirons, etc., are selling 25 per cent ahead of last year at this period.

Collections are somewhat slow, especially with the contractor-dealer class, which is inclined to overbuy. Accounts are carefully watched, particularly on new business.

NEW YORK

No falling off in the demand for electrical goods is reported. On the contrary, manufacturers are having a full quota of orders from distributors and jobbers, with the dealers absorbing whatever is obtainable in staples and specialties. Some price changes have been announced on insulation where cotton, linseed oil, etc., figure, and advances are said to be imminent in lines in which copper and brass are basic materials.

Deliveries improve not uniformly, but unevenly, the embargoes occasionally lifting temporarily and permitting the shipping and arrival of goods sometimes delayed for weeks en route. Labor is causing anxiety at the factories, shortage of skilled workers interfering seriously at times with their productive capacity.

Collections are reported as slowing up within a week or two. Credits were never so carefully watched.

SCHEDULE MATERIALS.—An advance of a substantial character on schedule materials—outlet boxes, standard sockets and receptacles, rosettes, shade holders, etc.—is about ready to be made by manufacturers whose lines are handled by almost the entire jobbing trade. The last increase was announced in November, when the discounts were lowered from 47 to 40 per cent. The impending change is credited to the difficulty of obtaining material, shortage of labor, the large investment required to carry on business and other considerations. On these goods buyers are advised to place orders early if reasonable deliveries are desired. Several carload shipments, held up for weeks en route, were received last week, easing the supply.

COLLECTIONS AND CREDITS.—Reports are to the effect that collections have fallen off about 5 per cent recently. No special cause is assigned.

FRACTIONAL MOTORS.—Small motors for sewing and washing machines, ironers, etc., are still coming through slowly. The demand exceeds all previous records.

LIGHTING FIXTURES.—Trade is quiet and has been for some time, owing to the slump in building operations. Some jobbers and dealers are having clearance sales to stimulate business, using discontinued styles as a price lever, shading prices to meet the varying circumstances presented. Such

other sides as are recorded are for replacements and improvements.

WIRING DEVICES.—Of the great variety scheduled the dominating orders are coming through governmental departments for war industries, material and equipment. These requirements are so large that only the manufacturers are thought to be able to handle them successfully, making deliveries in accordance with specifications. The orders are divided or distributed by a government representative in the electrical field, so that the different factories are treated on a capacity basis.

CONDUIT.—Distributors state that conduit is somewhat easier in all sizes for commercial demands. Freight embargoes are still hampering deliveries from the mills, which are reported to have an ample stock. Substitutes, made with less steel and having other claims to the trade's attention, are appearing in the market and being generously exploited. Prices remain firm on the regular lines.

CHICAGO

The volume of business in the Chicago territory continues to be fairly good, but evidence of the spotty characteristics formerly mentioned are still present. The week's news carries indications of improvement in future business. The Chicago Telephone Company has gone before the City Council asking a rate increase. With the People's Gas Light & Coke Company already asking for increased rates, this makes two out of Chicago's four important utilities applying for more revenue. The position of the Commonwealth Edison Company remains unchanged. It is buying resale merchandise for its electric shops and is making purchases of such materials as meters but there is no general buying movement or buying for construction.

In the industrial field the news that the United States Steel Company will build a great gun plant in the Middle West is taken to mean real business. Following such an enterprise there are always allied activities that provide orders for the entire trade. Not much electrical business is expected to result from the freight-car orders that have been placed in this territory, because freight cars carry no electrical equipment and the building of them is largely done outdoors so that very little factory electrical material is needed. There have been no price changes during the week, but certain changes, it is expected, will be announced soon.

PORCELAIN.—Contracts for porcelain are now being written with a provision for a price revision on July 1. This applies to the so-called standard lines and special products. It does not appear likely that it will affect high-tension insulators. That the price revision will be a revision upward, if it is made, appears unquestionable in the light of the labor and fuel situation in the porcelain production fields.

CONDUIT.—There is no improvement in the conduit delivery situation. Jobbers report that they are obliged to fight for every dollar's worth of conduit they get. The government is taking more and more of this product, and the situation appears likely to become worse.

COPPER WIRE.—The increase in the price of weather-proof wire has made no appreciable change in the business situation. Surprise is expressed that it did not go higher, and the belief has been put forward that manufacturers who have not raised their prices will very soon be obliged to do so.

METERS.—Two important meter factories in the Middle Western territory report that their business is holding up well as to volume. While this is somewhat surprising in view of the curtailment in residential building activities, it can be accounted for by the exceptional activity in industrial building.

INDUSTRIAL LIGHTING EQUIPMENT.—In spite of the daylight-saving law this class of apparatus is moving actively.

SPECIAL WIRE.—Local manufacturers of enameled and other special wire report that the factories have practically all the work that they can handle, but that fairly good deliveries are being made.

ELECTRIC RANGES.—Sales so far in 1918 are just about equal to what they were in 1917 at this date.

RESALE MERCHANDISE.—The business in resale merchandise continues good and gives promise of getting better. Jobbers report the volume in this class of goods to be far ahead of what it was this time last year. Not enough washing machines are available to meet the demand.

BOSTON

Trade holds up well, with the usual government basis of activity in evidence everywhere. Despite widespread complaints of poor railroad deliveries, due to embargoes and congestion, jobbers' stocks are, on the whole, in good shape to meet present requirements. There has been a great deal of far-sighted buying in past months predicated on a firm belief in the underlying soundness of the business situation in this part of the country. Governmental scrutiny of the expansion of public utility facilities is very close, and the deflection of equipment for central-station use into other channels is rather disquieting, as in the case of the Boston Edison company, which, it is said, must let go of a turbo-generator of some 35,000 kw. rating, ordered some time since, and now destined for government service.

Such events do not mean disaster to the central stations, but they indicate that everything is to be run close-hauled for the immediate future, with a sharp control of new business developments. Readjustments are constantly taking place as the war progresses, but there is no reason to expect the electrical buying power of New England to shrink to the starvation point because of these changes. Large orders for electrical material are going into the army and navy base work in this part of the country, and more are to follow. Competition is keen, and there is some complaint that these large orders are not so widely distributed as is desirable under present conditions.

SOCKETS AND SWITCHES.—An advance of from 10 to 15 per cent in prices on P. & S., Bryant, Hubbell, etc., schedule B and schedule S material, was expected on Monday and is likely to be in effect by this time.

COLLECTIONS.—These are fairly good, although somewhat slow among the contractor-dealer class, which seems to be laboring under a slight tendency toward overstocking. Accounts are carefully watched in these days, especially in connection with new business.

FANS.—Everything is ready for a record-breaking business in fans. Shipments are still coming into the jobbers' stockrooms, and even central stations which are pursuing a very conservative policy commercially are now ordering fans. The mill trade in fans, both for office and departmental service, looks unusually promising, and many industrial managers appear to realize to-day that the humble electric fan is a factor in hot-weather production not to be neglected.

FUSES.—A steady market is reported, with substantial sales to mill customers. Prices hold firm on various types.

ELECTRICAL SUPPLIES FOR AUTOMOBILES.—Business is very active. One jobber sold more than \$500,000 worth of automobile accessories, including much electrical material, last year. Stocks are in good condition and the outlook is excellent for the season.

FLASHLAMPS AND DRY CELLS.—A steady business is reported in the former, with a heavy absorption of product by cantonments and naval stations. Dry cells are in much demand by the garage trade.

ELECTROMAGNETS.—Large magnets for lifting service are in steady demand after a distinct "peak load" in sales last year, due to an apparent sudden realization of their economic value. A new field of service appears to be marine reclamation.

HEATING EQUIPMENT.—To offset a present quiet spell in domestic heating demand a very active period in specialized industrial electric heating applications is reported under way. The saving of time and insurance of high-quality production are strong points of interest under war conditions, and a broadening market is expected to develop. Prices are remarkably steady, considering changes in other lines.

ATLANTA

With the government operating in practically every essential line, general trade, while still heavy, has been subjected to further repression. The recent pledge of leading manufacturers to subordinate all other demands to government requirements makes for closer application to war business in the steel industry than at any previous period. It has been suggested that a continuous sixty days' run on government orders would make it feasible to give commercial needs more attention later. This idea has not received much encouragement, however, as summer operations must provide against any possible fuel and car shortage next winter.

Numerically orders are less than this time last year, but on the other hand the amounts are much greater, which indicates that the general volume so far is holding up, with big increases in some lines. The concrete ship is meeting with more favor, and it is reported that the United States Shipping Board will establish several additional plants at Southeastern or Gulf ports where the all-around climatic conditions are more favorable for this class of construction. The Bon Air Coal & Iron Corporation will erect a plant costing \$1,300,000 at Lyles, Tenn., for the extraction of methyl alcohol and acetate of lime, machinery alone to cost \$500,000.

LAMPS.—Stocks are well distributed and accumulating at certain points. The latter feature is due to the fact that manufacturers and jobbers are stocking up, anticipating the fall trade. The demand for lamps is excellent for this season and considerably over the same period of past years. The call appears to be general from all sections, mostly through small dealers. Industrial requirements have fallen off.

CABLE.—Factory stocks are reported to be in better shape. Local stocks, however, are in fair condition only, owing to embargoes and general transportation difficulties. The demand for heavy sizes has dropped off perceptibly at the same time that a sag in rubber is noted.

BELL-RINGING TRANSFORMERS.—Viewed through the eyes of the manufacturer the call for these is spotty, but jobbers and dealers report a steady demand. Shipments are coming in in sufficient volume to handle the volume of trade.

INSULATING MATERIALS.—A good market exists for varnished cambric, cloth and varnish. On the surface it would appear that less of this material is being used, but large quantities are utilized by repair shops and for manufacturers opening up shops for the repair of their own products. Mica and asbestos are the only materials slow in arriving.

FANS.—The arrival of seasonal weather has stimulated the movement of fans. The greater part of the shipments are being made to extreme Southeastern points. Stocks are ample.

SEATTLE

Northwest jobbers and dealers report a steady volume of sales during the past week, which is not unusual. There was no startling increase along any particular line. The past month's volumes were sustained. Labor shortage still defies solution and is hampering greatly. Shortages of conduit, rubber-covered wire and larger-sized lamps still prevail. This condition is practically conceded to be chronic. Domestic appliance sales are keeping up well. Government and shipyard sales show a very slight decrease.

Several of the largest Seattle electrical retailers report that domestic business for April exceeded in volume that of the same month last year by more than 50 per cent. The volume would be 100 per cent greater if mechanics could have been secured to build houses. Business in fixtures, wiring devices, lamps, bells, etc., has been exceptionally heavy in the past month with no let-up in sight until the summer camping season starts.

Domestic sales in vacuum cleaners, washing machines, sewing machines, irons and smaller appliances exceed those of last year at this period by more than 25 per cent. Central stations and larger retailers report sales of ranges very

satisfactory. Retailers report that commercial sales to other business houses show a heavy decrease over last year. This is due to the small amount of remodeling and new work in the business district. Wholesalers and jobbers report that sales of the larger size motors and power apparatus have decreased noticeably in the past two weeks. In fact, the supply is practically equal to the demand.

Wholesalers and jobbers at this time are realizing on heavy orders placed some time back. The past week's volume was gratifying, being somewhat heavier than for several weeks. Stocks are fairly well filled, although they are not pre-war stocks. Prices are holding steady, and shipments from the East are coming through in satisfactory shape, everything considered. One lesson has been thoroughly learned apparently by the Pacific Northwest jobbers and wholesalers, and that is anticipating future needs and demands and making preparations to care for them. Heretofore sales depended more or less on the question of deliveries. This factor is being eliminated by the dealers' foresight when possible.

A majority of the jobbing houses report lamp stocks in fair shape, although larger sizes are hard to obtain. The demand is steady and prices are firm. The diversion of thousands of cars from the East to the Pacific Northwest has overcome the shortage of equipment. There is now a surplus of cars for shippers' needs in Oregon and Washington, due to the inability of the lumber mills to load as fast as cars can be delivered.

SAN FRANCISCO

Country orders continue normal. They are composed of articles of staple call. City business, however, has been very quiet for the past week because of the National Electric Light Association convention at Del Monte. The real estate market records a number of sales of lots in San Francisco for industrial purposes. Several de luxe trains are to be taken off the Western sections of transcontinental lines. This will relieve needed hauling stock and trackage for freight shipments. That shipping conditions are being gradually improved is indicated by the resumption of twenty-day and thirty-day service between the Pacific Coast and Eastern points. Some factories are apprehensive of the government's declaration that it will shut off fuel oil from non-essentials, but California would be little affected by this order. Oil is to be diverted from the Pacific Northwest for California power companies.

The government is to construct a large number of new buildings in Camp Fremont to increase the camp's capacity to handle a second division. Thirteen acres of land have been purchased near San José on which to erect a vegetable and fruit cannery. Its cost is estimated at \$250,000, and it is said that it will be the largest of its kind in the United States. Fresno reports the construction of thirty-one bungalows at an estimated value of \$2,000 each. The Union Oil Company is to construct a large group of workmen's houses near Oleum. San Francisco building permits for April total 355 (of which 284 are alterations), totaling \$694,000. For the same period Oakland reports 240 (76 being alterations) at an estimated value of \$593,000.

The San Joaquin Light & Power Corporation is building fifty new lines to supply pumping plants with power. At present there are 225 plants connected up, and there is a heavier load at present on the substation than at any time last year. There is no assurance of power being supplied under the new applications for contracts, owing to the difficulty in securing transformers and the scarcity of labor.

GUARDS.—There were several industrial demands for low-priced portable guards during the past week. Vapor-proof and watertight guards are sold as fast as they are received from the East. The heavy duty demands and character of help supplied in the new war work factories, especially shipyards, demands absolute protection of all lamps.

CARBON LAMPS.—There was an export inquiry for 10,000 moving picture carbons to be the first shipment of a far larger quantity.

SCHEDULE MATERIAL.—Is still advancing in price. Plug cutouts, entrance switches and fuse plugs have just advanced about 10 per cent. Demand is below normal.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Grill with Rust-Proof Pan

A four-heat round grill equipped with rust-proof aluminum pans instead of nickel-plated steel pans is being marketed by Landers, Frary & Clark of New Britain, Conn. The device is known as E986 and is the same as type E984 with the exception of the

PANS ARE DETACHABLE AND MAY BE USED SEPARATELY

aluminum equipment. The manufacturers claim that these pans will withstand long boiling and soaking in water without damage because they are made of seamless aluminum. The pans may also be purchased separately.

Motor-Driven Drill and Tapper

A heavy-duty drill and tapper that eliminates the use of belts has been placed upon the market by the Barnes Drill Company, Inc., 830 Chestnut Street, Rockford, Ill. With the exception of a spindle sleeve and cross-arms all bearings and all gears are continuously lubricated by an automatic self-oiling system. The oil for this purpose is pumped from the reservoir at the base of the machine by geared pumps.

Eight changes of speed are provided

BEARINGS AND GEARS LUBRICATED BY AUTOMATIC SYSTEM

with control levers within easy reach of the operator from his position in front of the drill. For tapping the machine may be equipped with an automatic reversing mechanism which is

very desirable, especially for depth tapping. The trip on this mechanism can be set so that the instant the tap reaches the depth required the spindle will automatically reverse. These machines are driven by Westinghouse Electric & Manufacturing Company 10-hp. direct-current motors by means of a silent chain. A Westinghouse automatic starting panel, which may be entirely inclosed in a metal case, is also provided with this machine.

High-Tension Disk Insulator

A high-tension porcelain disk insulator that is said to be free from internal defects is shown in the accompanying illustration. The electrodes of the insulator are separated by 2.25 in. (5.7 cm.) of homogeneous porcelain, which is somewhat more than in the case of the ordinary insulator. A metal alloy is used to fasten the electrode to the porcelain instead of cement. The manufacturers claim that

METAL ALLOY FASTENS ELECTRODE TO PORCELAIN DISK

this alloy has a flexibility sufficient to withstand all temperatures, and that it will not crack the porcelain in hot weather. The quality of porcelain is said to be of the best, and porosity is entirely eliminated from the product as far as any test will detect. The insulator is known as the J-D insulator and is manufactured by the Jeffery-Dewitt Company of Detroit, Mich.

Automatic Starter for Industrial Motors

The advantages of automatic control for machine tools have been so persistently preached by the motor and control manufacturers that it is doubtful if there remain many operators who are not fully convinced that this type of control is both economical and productive. The complete controller shown herewith is manufactured by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is en-

tirely inclosed in a dust-proof case, 15 in. high by 17 in. long by 10 in. deep (38 cm. by 43 cm. by 25 cm.), and may be locked to prevent unauthorized persons from tampering with the switches. The knife line switch is operated from the outside of the case by a crank handle extending

AUTOMATIC CONTROL INCLOSED IN STEEL BOX

through one end, thus isolating the operator from current-carrying parts. The counter-emf. method of acceleration is used, and as the time of acceleration is dependent on the motor load, positive protection against too rapid acceleration is assured. Provision is made for either conduit or open wiring through the top, bottom and end of the case opposite the switch handle. These starters are provided with protection against the failure of power and may be so arranged that either the motor will be started again when the power returns or will require the service of the operator to start it. By using pressure gages or other automatic devices in connection with these starters automatic service may be obtained.

Unit Shade Connector

A unit shade connector that allows a convenient method of installation of a two-piece lighting fixture is being marketed by the J. H. White Manufacturing Company, 111 North Third Street, Brooklyn, N. Y. The connector consists of a chain with a rosette attached to each end. It is designed for units having $\frac{3}{8}$ -in. (0.95-cm.) slip holes. Three connectors are usually needed for attaching each unit, and they can be installed without the use of tools.

Ready-Made Outdoor Substation

Transmission-line companies selling small amounts of power from high-tension lines are often confronted with the necessity of designing small substations of such cost that the revenue obtained therefrom will justify the in-

stallation. To eliminate the usual drafting-room expense that has to be assumed by operating companies, the Delta-Star Electric Company, 2433 Fulton Street, Chicago, has placed upon the market a ready-made outdoor steel-frame substation that can be shipped complete for immediate erec-

STANDARDIZED STEEL SUBSTATION
SHIPPED COMPLETE

tion. These standardized substations are primarily designed for voltages up to and including 33,000 and are made in various kva. ratings. When small transformers are used they are mounted on a platform, but larger ones are mounted on the ground level. High-tension switching, fusing and choke-coil equipment consists of self-contained units with channel bases for bolting to the steel frame. Lightning arresters can be mounted upon the same structure or on the next line pole ahead of the station. The type "VB" form 18 substation is shown in the accompanying illustration.

Electric Washing Machine

An electric washer is being manufactured by the Richmond Cedar Works, Richmond, Va., of the dolly type and made of seasoned hardwood. It is equipped with a reversing wringer with a safety release device. The moving parts of the machine, such as gears, are inclosed in steel covers for protection from dirt and against accidents. It is driven by an Emerson motor.

Receptacle Clusters for Table Use

Receptacle clusters that can be set on the dining-room table and used for supplying energy for cooking utensils are being marketed by the Anderson Electric Specialty Company, 118 South Clinton Street, Chicago, Ill. They are constructed by using a Benjamin wireless cluster that is inverted and set upon the table. The plug at the top is connected to the dining-room lighting

fixture, and the energy supply is distributed from the receptacle to toaster, chafing dish or percolators that are used on tables. These devices are made in two styles, with either the two outlet or the three-outlet receptacle.

Unit-Type Safety Switchboard

Absolute safety to workmen operating switches, renewing fuses or working around switchboards is provided in an auto-lock switchboard which has recently been placed upon the market by the Krantz Manufacturing Company of Brooklyn, N. Y. The switchboard is interesting in the fact that each switch is in a separate compartment. Each of the smaller sections represents a switch unit, and each of the larger sections represents a compartment for busbars, wiring gutters and pull box. Nothing is mounted on the front of the switchboard except the switch handle and a card holder to indicate the circuits controlled by the switch. Since the switch handle is not connected with any current-carrying part, the front of the board is absolutely safe. On the back of the board, too, no live parts are exposed. If all the switches are closed so that the fuses are alive, all

FUSE DOOR MUST BE CLOSED BEFORE
SWITCH IS ENERGIZED

the fuse doors are automatically locked. If it becomes necessary to remove a fuse, the switch affected is thrown off when the switch door is open. It is also impossible for one man to close a switch when another is renewing the fuses. The door must be closed tightly before the switch can be thrown off and the fuses energized.

Cabinet Bushings That Snap into Place

A metal bushing for use in knock-outs, gutter linings of cabinets, meter loops, drop-cord covers and signs has been developed and will be soon placed on the market by J. J. Duck, 432 St. Clair Street, Toledo, Ohio. No spring or locking device is necessary as the bushing snaps into place like a glove fastener. Metal bushings are said to be more efficient than porcelain.

Heavy-Clamp Insulator Supports

A line of insulator supports of considerable strength has recently been brought out by the General Devices & Fittings Company, Mid-City Bank Building, Chicago. The line of supports has a great number of mounting arrangements and almost unlimited size ranges. They are of the split-clamp type and may be mounted on flat or round pipe surfaces. The standard pipe-mounted bases are listed for a

CLAMP INSULATOR THAT MAY BE EASILY
INSTALLED

1.25-in. (3.18-cm.) support, as this size is used almost universally, but bases of any size can be obtained if desired. The insulators may be used for bare or insulated conductors.

Farm Lighting Plant Without Battery Equipment

A farm lighting plant that is not equipped with a battery has been brought out by the Electromatic System Company, 2136 Michigan Avenue, Chicago. It is entirely automatic and is designed for use on the farm or in the suburban home, in public garages, stores or theaters, or in any place where light and power are needed. It delivers 115 volts direct current from the generator and is started by the turning of the switch at the point where electricity is to be used. It will remain in operation until the entire load has been removed. The plant is made in two sizes. The 1-kw. plant

OPERATION OF OUTFIT AUTOMATICALLY
DEPENDS UPON LOAD

is equipped with a two-cylinder engine and weighs 375 lb. (170 kg.) packed complete for shipping. The 3-kw. plant has a four-cylinder engine and weighs, packed for shipping, 175 lb. (215 kg.)

Farm Lighting Plants

The Gile Tractor & Engine Company of Ludington, Mich., is now marketing through the Consolidated Utilities Corporation, 221 Lake Street, Chicago, a 600-watt farm lighting plant. The engine is a 2.6-in. by 3.5-in. (6.7-cm. by 8.9-cm.) valve-in-head, four-cycle, water-

SET USES KEROSENE OR GASOLINE

cooled, 1600-r.p.m. unit. The generator operates at 32 volts to 40 volts. The plant is fully equipped, including a special governor and an arrangement to use kerosene if desired. The Consolidated Utilities Corporation has stated that the marketing of this plant will in no way interfere with the sale of its 1-kw., 2-kw., 5-kw. and 15-kw. Matthews automatic plants.

Feed-Water Weight and Temperature Recorder

The feed-water weight recorder manufactured by the Yarnall-Waring Company, Chestnut Hill, Philadelphia, which was described in the July 4, 1914, issue of the *ELECTRICAL WORLD*, is now being equipped with a temperature recorder. The recording-chart roll is arranged so that the temperature and the weight of the feed water are recorded

TEMPERATURE AND WEIGHT OF FEED-WATER RECORDED ON SAME CHART

on the same sheet, and both of these values can be obtained for any time during the twenty-four hours. This chart is also convenient for filing, and a large book is furnished with the

meter for permanent records. The outfit is furnished complete with a 5-in. (12.7-cm.) sensitive bulb, a separable 0.75-cm. (1.9-cm.) connection and 10 ft. (3 m.) of flexible insulated tubing. The instrument heretofore went under the name of the Lea V-notch meter, but it is now known as the Yarway V-notch meter with Lea recorder.

Rotary Synchronizers

Brushes for leading current to and from the moving coil are dispensed with and frictional effects are overcome in a rotary synchronizer that has been placed upon the market by Nalder Bros. & Thompson, Ltd., London, Eng. This is accomplished by the use of a small transformer in the instrument which is provided with a circular secondary coil. The secondary coil is electrically connected to the moving coil of the instrument and is rigidly attached to the spindle so that it is free to revolve in a narrow air gap without touching either the primary coil or the iron core of the transformer.

Surrounding the moving coil are four fixed coils. Two of these are connected in series with a resistance wound on a porcelain bobbin, and the other two are connected in series with a choking coil

INTERIOR WITH TRANSFORMER PRIMARY COIL AND CORE REMOVED

which is shown to the right behind the fixed coil. These two circuits are connected in parallel across the terminals of the incoming alternator. A magnetic field rotating with a frequency equal to that of the incoming alternator is thus produced. Similarly, the primary coil of the instrument transformer is connected to the busbar terminals of the meter, the moving coil thus receiving current of busbar frequency and setting up a pulsating magnetic field. The interaction between this and the rotating field causes the pointer to revolve in one direction or the other according to whether the frequency of the incoming alternator is greater or less than the busbar frequency. The number of revolutions per second made by the pointer is equal to the difference of these two frequencies. When the incoming alternator is running at synchronous speed the pointer comes to rest, but its position on the dial then gives a direct indication of the phase displacement between the busbar electromotive force and that of the incoming alternator. By slightly adjusting the speed of the latter the pointer can be caused to move slowly

around until it coincides with the bold mark at the top of the dial. Assuming the voltage of the incoming alternator and the busbars to be equal, the synchronizing switch may be closed and the excitation of the alternator adjusted until it takes its due share of the load.

Adapter for Portable Lamps

An adapter for portable lamps that permits the use of a great variety of lamp shades has recently been brought out by the National X-Ray Reflector

LAMP ADAPTER SMALL AT TOP

Company of Chicago. This adapter is listed as the "Curtis" and contains the X-ray mirror reflector which fills the room with a mellow, glareless light.

Semi-Indirect Lighting Fixture

A semi-indirect lighting fixture that is designed for use with a gas-filled lamp is being marketed by the Daylite Fixture Company, 416 South Dearborn Street, Chicago. This fixture is known as the Bel-Ko-Lite. The manufacturers claim that it can be easily cleaned and gives perfect diffusion.

Piston Vacuum Machine

The piston vacuum machine used by canners and preservers shown in the accompanying illustration combines a tumbler-sealing machine and a vacuum pump in one single unit. The amount of vacuum desired in each package can be regulated instantly and

SEALING AND VACUUM PUMP

the receptacle sealed immediately. The machine is made by the Anchor Cap & Closure Company, Brooklyn, N. Y., and is operated by a Westinghouse 0.75-hp. motor.

Trade Notes

SCHNEIDER ET CIE removed their offices on April 25 to 21 East Fortieth Street, New York City.

SUSSMAN & SUSSMAN, electricians, have removed their factory and offices to 8 and 10 East Thirty-first Street, New York City.

THE H. W. JOHNS-MANVILLE COMPANY of New York City will have its office at Houston, Tex., at 424-426 Washington Avenue after July 1.

THE WAR TRADE BOARD of Washington, D. C., has issued supplement No. 1, a revision of the "Enemy Trading List," containing additions, revisions, removals and corrections to April 1.

THE ELECTRIC SERVICE SUPPLIES COMPANY has secured larger quarters in the Hudson Terminal Building, 50 Church Street, New York City, and is now occupying rooms 1771 and 1773.

MCCARTHY BROTHERS & FORD of Olean, N. Y., manufacturers of electrical power, lighting and heating supplies, have moved into their new five-story concrete building at 75 to 79 West Mohawk Street.

H. O. BOURKARD will succeed F. Ernest Lauderbach as representative of the National X-Ray Reflector Company in its Southern territory. The company's St. Louis office has been closed, and Mr. Bourkard will make his headquarters at some central point in the territory.

THE ELECTRICAL SUPPLY & REPAIR COMPANY of Hazard, Ky., is reported as a new enterprise. L. B. Trumbull is president, and associated with him are C. E. Carlin and R. L. Cornell. The latter was formerly general manager of the Kentucky River Power Company.

JOHN A. DIENNER has been made a member of the firm of Brown, Hanson & Boettcher, 1550 Monadnock Block, Chicago. Mr. Diener has been associated with this firm of patent attorneys for four years, prior to which time he was an assistant examiner in the United States Patent Office at Washington, D. C.

THE BUREAU OF FOREIGN AND DOMESTIC COMMERCE, Department of Commerce, Washington, D. C., has published "Foreign Tariff Notes No. 27," reprinted from "Commerce Reports October-December, 1917." Copies may be obtained by forwarding 10 cents to the superintendent of documents, Washington.

F. T. BANGS, formerly of the advertising and sales department of the George Cutter Company of South Bend, Ind., has been made advertising manager of the Belden Manufacturing Company of Chicago. Prior to his connection with the George Cutter Company Mr. Bangs was for one and a half years associate editor of the *Electrical Review*.

THE MERCURY MANUFACTURING COMPANY of Chicago is issuing a sixteen-page monthly newspaper entitled *The Trackless Train*, illustrated, and devoted to the description and exploitation of its "Mercury tractors." In other words, the tractor is aimed to meet the need for better and more modern trucking methods adaptable to factory purposes.

CHESTER H. PENNOYER on April 7 became general sales manager of the National Conduit & Cable Company of New York City. He will devote much of his time to traveling in the Eastern States. Mr. Pennoyer is from Oakland, Cal., where he was physical superintendent of the Great Western Power Company during the construction of the big hydroelectric plant.

THE LIBERTY MANUFACTURING COMPANY, just formed, has acquired a plant at Carrollton Avenue and Oleander Street, New Orleans, La., it is reported, to manufacture electrical, foundry and other products. Eph. Rosenberg is president, P. Sefton Schneidau vice-president, and B. B. Hans secretary-treasurer. Operation of the plant has begun. The property measures 318 ft. by 310 ft. and is a "daylight" plant, equipped along modern lines.

THE DEPARTMENT OF COMMERCE of Washington, D. C., has issued, through the Bureau of Foreign and Domestic Commerce, a report entitled "German Trade and the War." It is the work of Chauncey D. Snow, assistant chief of the bureau, in collaboration with J. J. Kral. The part that Germany is planning to play in after-the-war trade is described thoroughly and authoritatively. A copy may be had by addressing the bureau or its co-operative offices.

E. E. MAHER has been appointed by the Terry Steam Turbine Company of Hartford, Conn., manager for the Chicago district, with offices at 1328-29 McCormick Building, 322 South Michigan Avenue. John D. Stout has become manager of the New York office of the Terry company in charge of that district, with the exception of navy and marine installations. Mr. Stout has been assisting Mr. Herbert, formerly in complete charge of the New York district, who will now devote his entire time to navy and marine requirements.

Trade Publications

OIL.—Turbo machine oil is advertised in a circular being distributed by the Borne Scrymser Company, 80 South Street, New York.

WIRE-HOLDERS.—Hubbard & Company, Pittsburgh, Pa., is distributing a circular describing the Peirce wire-holder for open wiring.

ELECTRIC FORGES.—The Buffalo Forge Company of Buffalo, N. Y., is distributing an illustrated catalog describing its portable forges.

ELECTRIC FANS.—A dealer circular has been issued by the Carleton Company, 170 Summer Street, Boston, Mass., describing the "Liberty" fan.

BULLETIN INDEX.—The General Electric Company, Schenectady, N. Y., has issued indexes to descriptive bulletins and sheets and also index of supply part bulletins.

FLOOR SWEEPERS.—William Firth, 200 Devonshire Street, Boston, has issued a folder describing the Firth broomless floor sweeper for cotton mills. This device sweeps floors by air suction.

SOCKETS.—"Harmony in Fixtures" is the title of a two-page circular being distributed by the Cutler-Hammer Manufacturing Company, Milwaukee, describing its porcelain sockets.

MAZDA LAMPS.—The new Westinghouse Mazda carton in orange and black is illustrated in a folder being distributed by the Westinghouse Lamp Company, 165 Broadway, New York City.

STEAM TRAPS.—The Sterling direct-return steam trap is described and illustrated in a circular issued by the Templeton Manufacturing Company, Parkway and Sterling Streets, Cambridge, Mass.

HIGH-TENSION INDOOR EQUIPMENT.—Switches, fuses and choke coils are illustrated and described in bulletin No. 33, being issued by the Delta Star Electric Company, 2433 Fulton Street, Chicago.

FIRE ALARM SYSTEMS.—W. R. Osterlander & Company, 371 Broadway, New York City, have issued a bulletin describing their fire-alarm system for factories, hotels, department stores and public institutions.

STORAGE BATTERIES.—The General Lead Batteries Company, Chapel Street and Lister Avenue, Newark, N. J., is distributing bulletins Nos. 25, 26 and 27, describing its storage batteries for starting and lighting automobiles.

ELECTRICAL SPECIALTIES.—Harvey Hubbell, Inc., Bridgeport, Conn., has issued a catalog on electrical specialties, containing illustrations of the newest Hubbell specialties, with charts, indexes, price lists, etc., for the same.

ELECTRICAL SPECIALTIES.—The Hamilton-Beach Manufacturing Company, Racine, Wis., has issued a booklet for its salesmen entitled "Electric Labor-Saving Devices." It shows not only the company's product but also its sales help.

BALL BEARINGS.—The SKF Ball Bearing Company, Hartford, Conn., has issued an illustrated booklet entitled "Woodworking Precision at High Speed." The bulletin deals with the application of ball bearings to electric motors for woodworking.

SILENT CHAINS.—Book No. 312 has been issued by the Link-Belt Company, Philadelphia, describing the Link-Belt silent chain drive for operating machine tools. The bulletin is profusely illustrated with machines showing actual installations.

RHEOSTATS.—The Ward Leonard Electric Company, Mount Vernon, N. Y., is distributing a circular entitled "Universal Charging Rheostat for Charging of Starting, Lighting and Ignition Batteries." This device can be used to charge any number of cells from one to the maximum that can be connected in series and charged from 40 volts.

New Incorporations

THE KENNEDY-WEBSTER ELECTRIC COMPANY of Chicago, Ill., has been incorporated with a capital stock of \$30,000 by Harry M. Kennedy, William H. Webster and Kenneth G. Kennie.

THE GENERAL SUPPLY & LIGHT COMPANY of Cleveland, Ohio, has been incorporated with a capital stock of \$10,000 by J. B. Goldenberg, H. A. Rocker, J. Schnuerer and Arthur Krause.

THE CONTINENTAL ELECTRIC COMPANY of Detroit, Mich., has been chartered with a capital stock of \$10,000. The incorporators are: M. R. Bryant, Henry Burdeno, W. J. Moore of Detroit.

THE WHOLESALE ELECTRICAL SUPPLY COMPANY of Tulsa, Okla., has been incorporated with a capital stock of \$30,000 to deal in electrical supplies. Albert H. Bell is president and Ray S. Fellows secretary.

THE STORAGE BATTERY & APPLIANCE COMPANY of Philadelphia, Pa., has been incorporated with a capital stock of \$150,000. The incorporators are: Donald G. Scott, William Knoblock and William J. Graham.

THE BELYEA-GRANT ELECTRIC MACHINERY COMPANY of New York, N. Y., has been incorporated by R. Grant, B. M. and T. S. Belyea, 48 East Eighth Street, New York City. The company is capitalized at \$5,000.

THE UNITED ELECTRIC COMPANY of Marlboro, Mass., has filed articles of incorporation with a capital stock of \$10,000. The directors are: H. J. Rougeau, president; Arthur J. Rougeau of Marlboro, treasurer, and E. M. Rougeau.

THE HARRY S. ORR COMPANY of Boston, Mass., has been incorporated by Harry S. Orr, George M. Heathcote of Newton and George L. Ellsworth of Boston, Mass. The company is capitalized at \$50,000 and proposes to deal in electrical goods.

THE ELECTRIC TYPE DAIRY COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$500,000. The incorporators are: M. I. Perty, F. L. Buck and K. E. Longfield of Wilmington, Del.

THE OHIO MECHANICAL & ELECTRICAL MAINTENANCE COMPANY of Mansfield, Ohio, has been incorporated with a capital stock of \$1,000 by William H. Thompson, Guy E. Thompson, Ellsworth G. Clark, Harry Calhoun and Frank Schwartz.

THE R. V. G. COMPANY of Brooklyn, N. Y., has been incorporated with a capital stock of \$25,000 to manufacture electrical specialties. The incorporators are: F. Goldberg, R. Goldberg, Great Kills, S. I., and L. J. Cohen, 52 Broadway, New York City.

THE BANNISTER HYDROELECTRIC COMPANY of Los Angeles, Cal., has been incorporated with a capital stock of \$200,000 by George R. and Robert B. Bannister and Perry H. Brown. The company proposes to manufacture an electric gage and similar products.

THE PHILADELPHIA ELECTRIC STEEL COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$70,000 to do a general steel business. The incorporators are: C. L. Rimplinger, M. M. Clancy and F. A. Armstrong of Wilmington, Del.

THE DILWORTH MANUFACTURING COMPANY of Hoboken, N. J., has been incorporated by Ernest E. Davies of Hoboken; N. P. Hill of Montclair, and George C. Sprague of Englewood Heights, N. J. The company is capitalized at \$50,000 and proposes to manufacture wireless and electrical equipment.

THE JOHN C. SERVICE COMPANY of New York, N. Y., has been incorporated by J. C. Williams, Lake View Avenue, Brightwaters; A. Stemmermann, 417 Brevoort, Richmond Hill, and W. S. Ross, 64 Montague Street, Brooklyn. The company is capitalized at \$25,000 and proposes to do a general contracting and electrical engineering business, etc.

THE SINGLAND POWER COMPANY OF NEW JERSEY has filed articles of incorporation under the laws of the State of Delaware. The company is capitalized at \$250,000 and proposes to acquire patent rights to develop power by air. The incorporators are: Leonard Singland, Frank P. Venable, John H. Mussner and Louis J. Patmost of Paterson, N. J.

New England States

CONTOCOOK, N. H.—The Contocook Electric Light Company is extending its electric transmission line through the town south of Willow Hollow to connect with the Boston and Maine lines.

MANCHESTER, N. H.—The Manchester Traction, Light & Power Company has completed its dam on the Piscataquog River at Gregg's Falls. Two generators of 1500 kw. each will be installed in the new power station. Electricity will be transmitted at 33,000 volts to the Kelley's Falls station. The main generating room of the power station, not yet completed, will be 85 ft. by 40 ft.; the transformer room will be 25 ft. by 74 ft., and will be equipped with three transformers each having a rating of 1250 kva.

LUDLOW, VT.—Arrangements have been made by the commissioners of the municipal electric light plant with the Colonial Power & Light Company of Cavendish for furnishing 200 kw. additional, which is to be used by woolen mills working on government orders.

CANTON, MASS.—Plans have been prepared by A. H. Wright, 53 State Street, Boston, for the construction of an addition to the engine house of the plant of the Springdale Finishing Company.

MILLBURY, MASS.—The New England Power Company of Worcester has petitioned the Selectmen for permission to erect a high-tension transmission line across the Providence Railroad and South Main Street, near the Sutton line. The proposed line will extend from Worcester to Webster.

SPRINGFIELD, MASS.—The United Electric Light Company will remodel its building at State and Water Streets for an electrical switching station. The cost is estimated at \$102,000. Contract, it is understood, has been awarded for the work.

DANBURY, CONN.—The property of the National Electric Utilities Corporation of Danbury has been purchased by Landers, Frary & Clark of New Britain. The purchasing company, it is understood, will continue the business of the Utilities corporation in its present building and plan extensions to same.

NORWICH, CONN.—Contract has been awarded by the Eastern Connecticut Power Company to Fred T. Ley & Company, Springfield, Mass., for the construction of its proposed steam power station in Norwich.

PUTNAM, CONN.—Plans have been prepared by the Cochrane Manufacturing Company, 56 Barrett Avenue, Malden, Mass., for the construction of a new power house, transmission system, and dam in Putnam. Erastus Worthingham, of Dedham, Mass., is engineer.

Middle Atlantic States

ALBANY, N. Y.—Bids will be received by the Board of Contract and Supply, Albany, until June 17 for electric-lighting fixtures for the city hall. Drawings and specifications, etc., may be seen at the office of the associate architects, C. G. Ogden and Joseph J. Gander, 61 State Street, Albany, or at the office of the Board of Contract and Supply, City Hall.

ALBION, N. Y.—The contract for the construction of the proposed addition to the boiler plant at the Western House of Refuge has been awarded to Henry C. Belson of Albion.

BINGHAMTON, N. Y.—The Ansco Company has awarded a contract to the Binghamton Light, Heat & Power Company for furnishing electricity to operate its plant at Johnson City. About 100 hp. will be required in small motors.

BROOKLYN, N. Y.—Plans have been filed and contract awarded to John H. Deeves & Brother, 103 Park Avenue, New York City, by the Arabol Manufacturing Company, 100 William Street, New York, for the erection of an addition to the boiler plant at its local works.

BROOKLYN, N. Y.—Contracts have been awarded by the E. W. Bliss Company of Brooklyn to the Hedden Construction Company, 52 Vanderbilt Avenue, New York City, and W. H. and F. W. Cane, Woolworth Building, for the construction of an addition (seven stories) to its projectile works on Fifty-third Street, near First Avenue. 200 ft. by 300 ft., to be supplemented by a pier, 60 ft. by 575 ft.

BUFFALO, N. Y.—Plans are being prepared for the construction of a new power house, about 40 ft. by 40 ft., in connection with the new plant of the Buffalo Cereal Company.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

CENTRAL ISLIP, N. Y.—Plans are being considered by the State Hospital Commission for the installation of new boilers and other equipment at the State Hospital at Central Islip. The installation of a new heating plant at the institution is also contemplated. E. S. Elwood is secretary of the commission.

GLENS FALLS, N. Y.—The construction of a new transformer station at Canastota is under consideration by the Adirondack Electric Power Corporation. H. J. Hunsicker is chief engineer.

NEW YORK, N. Y.—Plans have been prepared for the construction of a new transformer station for the Gryphon Rubber & Tire Company on Bailey Avenue near 192d Street.

NEW YORK, N. Y.—The United Electric Light & Power Company, 130 East Fifteenth Street, New York, has purchased a site, 47 ft. by 100 ft., on which it proposes to erect an electric power station.

NEW YORK, N. Y.—Work has begun on the erection of a new power house to be built by Kenneth Stevenson, 25 Broad Street, at 172-80 Water Street. The proposed building will be 105 ft. by 115 ft., five stories, and will cost about \$350,000.

OLEAN, N. Y.—The Olean Electric Light & Power Company is contemplating the purchase of additional equipment.

CAPE MAY COURTHOUSE, N. J.—The contract for installing electric lighting fixtures for the Middle Township high school at Cape May Courthouse has been awarded to the L. L. Jones Company, 1019 Atlantic Avenue, Atlantic City.

SOUTH PLAINFIELD, N. J.—Plans are being considered by the Spicer Manufacturing Company for the construction of a new power house at its works here.

TRENTON, N. J.—Preliminary plans are being prepared by J. O. Hunt, 114 Montgomery Street, architect, for the construction of a new power plant at the works of John E. Thropp & Sons, Lewis Street.

TRENTON, N. J.—The City Commission has granted the Trenton & Mercer County Traction Corporation permission to erect wires on the poles on South Broad Street between Liberty Street and Cedar Lane, owned by the Public Service Corporation and the Bell Telephone Company. The company is making improvements to its street car line in the West State Street section, as well as on the Princeton, Lawrenceville, Pennington, Hopewell and Yardville divisions.

BETHLEHEM, PA.—The Bethlehem Electric Company has filed notice with the Public Service Commission of an issue of \$50,000 in bonds, the proceeds to be used for extensions and improvements.

ELWOOD CITY, PA.—The Pennsylvania Power Company, which recently purchased considerable water-front property in the Turkey Hill section, about 5 miles south of Wrightsville, is reported to be planning the construction of a dam.

ERIE, PA.—The Burke Electric Company is reported to be planning an addition to its local plant. Another small plant, it is said, will be established in Conneautville in the near future by the company for the manufacture of a new line of electrical work.

HARRISBURG, PA.—The Harrisburg Light & Power Company has filed notice with the Public Service Commission of an issue of \$50,000 in bonds, the proceeds to be used for extensions and improvements.

LANCASTER, PA.—The Edison Electric Company has filed notice with the Public Service Commission of an issue of \$115,000 in bonds, the proceeds to be used for extensions and improvements to its system.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 20 under specification 2952 for construction of power house and two transformer stations at Philadelphia, to cost about \$188,000.

PITTSBURGH, PA.—Plans are being prepared for the construction of a new power plant for the Pittsburgh Modern Laundry Company in connection with its proposed new plant. The cost of the entire work is estimated at about \$60,000. Paul W. Irwin, Renshaw Building, Pittsburgh, is architect.

WESCOESVILLE, PA.—The construction of an addition to the local boiler plant is under consideration by the Commissioners of Lehigh County for which plans are now being prepared by Tilghman Moyer, architect, 824 Hamilton Street, Allentown.

LINTHICUM HEIGHTS, MD.—Work has begun on the erection of the proposed new power house of the Consolidated Gas & Electric Company in Linthicum Heights, to cost about \$7,000. The Cogswell-Roecher Company, 406 Park Avenue, Baltimore, has contract for building.

ST. HELENA, MD.—Contract has been awarded by the United States Shipping Board to the Consolidated Engineering Company, Calvert Building, Baltimore, for construction of bakery, power house, 302 convertible houses, etc., at St. Helena, to cost about \$800,000.

ALEXANDRIA, VA.—Contracts have been awarded by the Virginia Shipbuilding Corporation of Alexandria for the construction of a shipbuilding plant on the Potomac River, to cost about \$5,000,000, to Frederick T. Ley & Company, 19 West Forty-fourth Street, New York, N. Y., and the Raymond Concrete Pipe Company, 90 West Street, New York. The initial works will consist of 12 one and two-story buildings, including a machine shop and a foundry.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, until May 20, for installing at the navy yard, Philadelphia, Pa., coal and ash-handling equipment for aircraft factory, to cost approximately \$35,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 27 for constructing an eight-way tile duct system with manholes, complete for break-down service between the frequency changer building, Navy Yard, and the Capitol power plant, Garfield Park, Washington. Drawings and specification No. 2959 may be obtained upon application to the above bureau or to the commandant of the navy yard named.

North Central States

BELLAIRE, MICH.—At an election held recently the proposal to issue \$6,000 in bonds for improvements to the municipal electric-light plant was carried.

AKRON, OHIO.—A permit has been granted the Wellman-Seaver-Morgan Company for the erection of a fireproof power house on Kenmore Boulevard.

CALEDONIA, OHIO.—The County Commissioners have granted the Delaware & Marion Railway Company a franchise to erect transmission lines from Marion to Caledonia, a distance of 10 miles, to furnish electricity here. The local electric plant was recently closed down on account of the high cost of fuel and labor.

CINCINNATI, OHIO.—The Union Gas & Electric Company is reported to be contemplating the installation of a third electric generating unit.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until May 24, for steel smoke breeching for the division of light and heat.

CLEVELAND, OHIO.—The France Manufacturing Company, 1434 West Seventy-fifth Street, is planning to build a new plant at Berea Road. The company manufactures magnetic rectifiers, ammeters, electric meters, carbon rheostats and rotary strippers.

DILLES BOTTOM, OHIO.—The power plant of the Fort Pitt coal mines in Dilles Bottom was destroyed by fire recently, causing a loss of about \$25,000.

EATON, OHIO.—The County Commissioners have granted the Twin Valley Light & Power Company a franchise to erect and maintain electric transmission lines to transmit electricity for a distance of about 9 miles, in the southeast part of Preble County for a period of 25 years. The company proposes to supply electricity to farmhouses along the line, which it will purchase from a traction company. J. E. Flora, William Knopp and others are interested.

HAMILTON, OHIO.—Bids will be received at the office of the County Commissioners, Hamilton, Ohio, until May 25 for the installation of a lighting system for bridge and viaduct over the Miami River between Middletown and West Middletown, including furnishing and placing of conduits, glassware, metal globe holders, sockets, etc. Plans and specifications

are on file in the office of the county auditor and County Commission, Hamilton.

HURON, OHIO.—The City Council is considering an issue of \$4,500 in bonds for improvements to the municipal electric-light plant and water-works system, including the installation of two electric motor-driven water pumps, equipping the water department with meters and providing equipment for unloading coal at the railroad station.

MANSFIELD, OHIO.—Preparations are being made by the Farmers' Dairy & Produce Company for enlarging and remodeling its plant on East Third Street. It is proposed to equip the plant to purify the milk by the electrical process. The name of the company has been changed to the Electro Pure Process Company.

SANDUSKY, OHIO.—Preparations are being made by the Hinde & Dauck Paper Company to move into its new factory. The power requirements of the new plant will be considerably in excess of the old factory. All direct-current motors will be eliminated. Power for operating the plant will be supplied by the Sandusky Gas & Electric Company.

TOLEDO, OHIO.—The City Council has authorized the installation of 50 additional arc lamps in the streets of the city.

YOUNGSTOWN, OHIO.—The Mahoning & Shenango Railway & Light Company has applied to the Public Utilities Commission for permission to issue \$600,000 in bonds to be sold at 90, and \$200,000 in preferred stock. The Interstate Commerce Commission has approved an application by the company to issue these securities.

LEXINGTON, KY.—The American Metallic Packing Company, it is reported, would like to receive prices on a 300-kw., 250-volt, second-hand (must be in first-class condition), direct-current generator directly connected to steam engine.

DANVILLE, IND.—The Merchants' Heat & Light Company of Indianapolis has applied to the Public Service Commission for permission to issue \$140,000 in bonds and \$60,000 in capital stock, the proceeds to be used to purchase the property of the Danville Light, Heat & Power Company. The local company purchases energy from the Merchants' company and distributes it in Danville, Plainfield, Brownsburg, Clermont, Avon and rural districts adjacent.

CHICAGO, ILL.—Contracts, it is reported, have been awarded by the Illinois Central Railroad Company for the construction of a new electric power plant at Ninety-eighth Street and Cottage Grove Avenue to Joseph E. Nelson & Sons, 118 LaSalle Street, Chicago. The cost of the proposed plant is estimated at about \$60,000.

CLINTON, ILL.—Preparations are being made by the Illinois Central Railroad Company, it is reported, for improvements to its local shops. The proposed work will include rebuilding the machine shop, enlarging the erecting shop, the construction of a new power house, installation of new boilers and other work, for which contracts, it is understood, have been awarded.

NORTH CHICAGO, ILL.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until May 27 under specification 2993 for installing an electric distributing system at the Great Lakes Training Station. Further information may be obtained on application to the chief of bureau.

ST. JOSEPH, ILL.—Plans have been prepared for rebuilding the plant of the Berry Iron & Steel Company, which was recently destroyed by fire. It is proposed to replace the two buildings burned with five, designed for railroad foundry work. The main foundry room will be 50 ft. by 260 ft., and will be equipped with two cranes.

PRESTON, MINN.—The Root River Power & Light Company, it is reported, is planning to extend its electric system from Caledonia to Houston during the coming summer.

DES MOINES, IOWA.—All bids submitted for the electroliners (259) for lighting the Capitol extension have been rejected. The lowest bid was \$30,000, which was considered too high by the Council. It has been decided to postpone indefinitely the installation of ornamental lamps and to reduce the number of lamps to be installed at this time to a number sufficient to make the grounds safe.

NEW ENGLAND, N. D.—The Asby Light & Power Company is reported to have purchased the property and equipment of the Gardner Electric plant. As soon as the necessary changes in connection with the consolidation can be made, a 24-hour service will be established.

BRADLEY, S. D.—The Dakota Northern Power Company, it is reported, is con-

templating the construction of a power station and the purchase of equipment. E. L. Lewis is secretary.

ATWOOD, KAN.—The municipal electric-light plant has recently been changed over from direct to alternating current. New electric lines are being erected in the city limits. The plant is driven by Fairbanks-Morse oil engines. S. F. Snyder is superintendent.

Southern States

GLIDEN, N. C.—R. O. Blanchard, of Gliden, it was reported, would like to communicate with manufacturers and dealers of electrical and water-power machinery.

ATLANTA, GA.—Contract has been awarded to the Bailey Oliver Electric Company, 73 Walton Street, Atlanta, for furnishing addition to main switchboard, power tablet and electric feeders for lamps and motors in the United States penitentiary at Atlanta, at \$3,300.

COLUMBIA, TENN.—Arrangements have been completed by the Southern Cities Power Company for the construction of a power plant on Duck River, to cost about \$100,000. The work will include the construction of a crib dam, 12 ft. high, a power house and a 15-mile transmission line to Mount Pleasant, at a cost of \$25,000. The initial installation will provide for a development of 450 hp. for transmission to Mount Pleasant. Contracts have been placed for equipment and construction work. M. R. Stern is general manager.

RUTHERFORD, TENN.—At an election held recently bonds to the amount of \$10,000 were voted for the installation of an electric-light plant in Rutherford.

DE QUEEN, ARK.—The De Queen Lumber Company is planning to equip its mill, having a daily capacity of 100,000 ft., with motor-driven machinery. W. O. Creason is manager.

GUEYDAN, LA.—The city has taken over the electric-light plant and water-works system, to be owned and operated by the municipality. Improvements involving an expenditure of \$15,000 will be made to the electric plant, and \$20,000 will be expended on the water works. An ice factory of 10 tons capacity will be built at a cost of about \$10,000. It is proposed to house the three plants in one building. New equipment, including crude-oil engine, to develop from 50 to 100 hp., will be installed in the electric plant; plans for the water works include a 6-in. deep well, 60,000-gal. tank, 100-ft. elevation, pumps, mains, etc. The J. B. McCrary Company of Atlanta, Ga., has charge of the engineering work.

JENNINGS, OKLA.—Bonds to the amount of \$25,000 have been voted for the installation of an electric-light plant in Jennings.

OKLAHOMA CITY, OKLA.—Final plans have been prepared for the construction of the Chickasaw hosiery mills, which will include a 150-hp. steam and electric power plant and dyeing machinery. The plant will be equipped with electric-driven motor machinery. The cost of the entire plant is estimated at about \$60,000. T. E. Cullen, Colcord Building, is secretary and treasurer.

DEL RIO, TEX.—Steps have been taken by the City Council for the installation of a municipal electric-lighting plant.

MERCEDES, TEX.—The Mercedes Water, Light & Power Company is planning to install a new 100-hp. engine and generator. When improvements are completed a 24-hour service will be established in Mercedes.

RUSK, TEX.—Improvements are contemplated by the Texas Steel Company involving an expenditure of about \$75,000, and will include the installation of a large pump, for water circulating, improvements to blast furnace and pipe foundry, replacing motors and overhauling cranes, etc. Work is already under way.

Pacific and Mountain States

SEATTLE, WASH.—The Board of Public Works has selected the Skagit River power site for immediate development for additional power for the city. All other offers have been rejected. The board has suggested to the Council that new detailed plans and specifications be prepared in accordance with the physical condition encountered on the Skagit River, conditional upon the approval of the site by the City Council.

SPOKANE, WASH.—The Westinghouse Electric & Manufacturing Company of

Pittsburgh, Pa., it is reported, has acquired the controlling interest in the Spokane Heat, Light & Power Company, which operates a central heating, lighting and power plant, furnishing service to the central district of Spokane.

TACOMA, WASH.—The City Lighting Department is considering a contract with the Tacoma Railway & Power Company, under which the company will install, maintain and operate the large generator which the city has purchased and for which no space has been provided. The Tacoma company has offered for \$1,800 per year to install and operate the generator and hook it up with its own switchboard, so that if the peak load were exceeded the company could cut in the city line on its own current. Hamilton Groner, commissioner of light, estimates that it would cost the city \$10,000 to build a substation on the tidelands and \$4,500 for salaries to operate the plant.

ASTORIA, ORE.—The Hammond Lumber Company, it is reported, has placed contracts for an additional turbine and generator of 2000 hp. and for four 600-hp. water-tube boilers.

PORTLAND, ORE.—The contract for the electrical equipment in the new municipal grain elevator in Portland has been awarded to the Ne Page-McKinney Company of this city.

PORTLAND, ORE.—The Liberty Foundry, Inc., recently incorporated, has leased the plant of the Lister Sash Weight Company, which it proposes to equip for a foundry and machine shop. The company contemplates adding electric welding and brass and bronze casting departments. William Cornfoot, shipbuilder, is among the incorporators.

GRIDLEY, CAL.—Contracts, it is reported, have been placed by Rosenberg Brothers & Company of Gridley for equipment for an entire new power plant to operate their rice mill here. The capacity of the new plant will be 40 per cent more than the present plant. Arrangements are also being made by the company to build a new two-story mill, 100 ft. by 240 ft., to be equipped with all new labor-saving devices. The company is reported to be planning the erection of two additional mills in the Sacramento Valley at points yet to be designated.

HOLLISTER, CAL.—The installation of an electrolier lighting system in the business district of the town is under consideration.

MODESTO, CAL.—Plans are being considered by the Sierra & San Francisco Power Company for extensive improvements, including the construction of a hydroelectric power plant on the Middle Fork of the Stanislaus River.

SAN FRANCISCO, CAL.—Plans of the Bethlehem Steel Company for the construction of a large steel ship repair plant at Hunter's Point, San Francisco, have been accepted by the United States government. The work includes the erection of machine shops, fabricating plants, marine railroad and other equipment. Three floating docks, with a capacity of 8000, 4000 and 3500 tons, respectively, are to be moved to the new location, and two additional docks built. The cost of the entire project is estimated at \$2,000,000.

NOGALES, ARIZ.—The Arizona Gas & Electric Company of Nogales has petitioned the State Corporation Commission for permission to issue \$100,000 in bonds, the proceeds to be used to pay for outstanding indebtedness and for an additional generating unit, to cost \$30,000.

CALIENTE, NEV.—The installation of an electric-lighting system in Caliente is reported to be under consideration.

Canada

VANCOUVER, B. C.—The Jarvis Electric Company of Vancouver has been awarded the contract for electrical machinery to be installed on the three auxiliary sailing ships under construction by the William Lyall Shipbuilding Company, including three generators, directly connected to gasoline engines, electrically driven sail hoists and motor equipment for air-compressors and bilge pumps.

BROCKVILLE, ONT.—Arrangements are being made by the Cedar Rapids Transmission Company to supply electricity generated at Mille Roches to the towns along the St. Lawrence River. Brockville, it is understood, will be the chief distribution center.

HAMILTON, ONT.—The installation of a private power plant in the City Hospital is under consideration by the board of governors. Dr. W. A. Langrill is medical superintendent.

(Closed April 30, 1918.)

- 1,263,197. APPARATUS FOR REGULATING HEATING SYSTEMS; Everett H. White, St. Paul, Minn. App. filed Feb. 17, 1915. Dampers of a heating furnace, hot water, steam or otherwise, may be suitably controlled.
- 1,261,137. MEASURED-SERVICE TELEPHONE SYSTEM; Albert Andersen, Chicago, Ill. App. filed Dec. 5, 1913. Improvements.

- 1,264,333. CIRCUIT INTERRUPTER; Carl C. Randall, Edgewood Park, Pa. App. filed Aug. 2, 1913. Knife-blade switch of the quick-break type.
- 1,264,335. CONTROL SYSTEM; Lynn G. Riley, Wilkensburg, Pa. App. filed May 3, 1915. For controlling dynamo-electric machines.
- 1,264,340. REVERSING MECHANISM FOR WASHING MACHINES; George Simon and Fritz Balzer, Chicago, Ill. App. filed Feb. 8, 1915. Actuated by the movement of the reversible parts.
- 1,264,354. CONTROL SYSTEM; Charles C. Whitaker, Wilkensburg, Pa. App. filed Aug. 10, 1915. For pantograph trolleys.
- 1,264,366. CALLING DEVICE; Henry P. Clau-chen, Mount Vernon, N. Y. App. filed Oct. 13, 1916. Impulse transmitters for automatic and semi-automatic telephone systems.
- 1,264,378. CONTROLLING SYSTEM; Amos F. Dixon, Newark, N. J. App. filed March 16, 1914. Arranged to control the feed of a paper tape such as is used in automatic telegraphy.
- 1,264,388. TELEPHONE SYSTEM; Olof M. Guthe, East Orange, N. J. App. filed Aug. 20, 1917. Improvements.
- 1,264,396. LIGHTNING ARRESTER; Frederick W. Hays, Pittsburgh, Pa. App. filed June 15, 1916. Improvements.
- 1,264,402. METERING SYSTEM FOR AUTOMATIC TELEPHONE EXCHANGES; Jacob W. Lattig, Glenside, Pa., and Charles L. Goodrum, New York, N. Y. App. filed Sept. 24, 1915. Subscribers are charged for calls as originated in accordance with the services rendered.
- 1,264,404. KNIFE-BLADE SWITCH; Ronald Lister, Chorlton-cum-Hardy, England. App. filed June 27, 1917. Hinge and contact members formed entirely of strip metal.
- 1,264,405. ARC-LAMP GLOBE; George M. Little, Pittsburgh, Pa. App. filed Aug. 11, 1913. Arc lamps.
- 1,264,406. POST-TYPE ARC LAMP; George M. Little, Pittsburgh, Pa. App. filed Dec. 4, 1913. Permits inspection of lamps and the necessary replacements to be readily made, and will allow of a weatherproof design.
- 1,264,413. SIGNAL DEVICE; Jesse F. MacDonald, Billings, Mont. App. filed April 30, 1917. Adapted for use on motor vehicles.
- 1,264,414. DISCONNECTING SWITCH; Joseph H. Mahoney, Wilkensburg, Pa. App. filed April 24, 1913. Will open and close with a minimum pull or twist on the insulators forming the pillars of the switch.
- 1,264,415. ELECTRICAL PROTECTIVE DEVICE; Joseph N. Mahoney, Wilkensburg, Pa. App. filed April 3, 1914. For reverse-current and underload tripping devices for circuit interrupters.
- 1,264,420. MEANS FOR PRODUCING ALTERNATING CURRENTS; Friedrich W. Meyer, Pittsburgh, Pa. App. filed March 24, 1915. Inverted rectifiers of the vapor type.
- 1,264,421. ELECTRIC SWITCH; Charles H. Miller, Milwaukee, Wis. App. filed Oct. 28, 1913. For automatic motor starters.
- 1,264,444. INDUCTION MOTOR; George J. Schmidt, Wilkensburg, Pa. App. filed Dec. 4, 1914. Method of controlling motors.
- 1,264,450. OUTLET BOX WITH KNOCK-OUT SECTIONS; Oliver T. Sweet, St. Louis, Mo. App. filed June 28, 1916. Easily and quickly removed at the time the box is installed.
- 1,264,465. AUTOMATIC CIRCUIT-CLOSER ATTACHMENT FOR TELEGRAPH KEYS; James L. White, Buffalo, Tex. App. filed July 19, 1917. Automatically closing the line circuit to the next station immediately upon release of the key by the operator.
- 1,264,473. COMBINATION SWITCH; Howard H. Baker, Buffalo, N. Y. App. filed July 24, 1915. Can be partly dismantled or taken apart for inspection or repairs without disclosing the combination.
- 1,264,482. ELECTRIC CONNECTOR FOR DASH LAMPS, ETC.; John Berg, Chicago, Ill. App. filed July 20, 1917. Means for securely mounting a dash lamp on an automobile.
- 1,264,507. MULTI-UNIT TELEPHONE TRANSMITTER; William W. Hanscom, San Francisco, Cal. App. filed Feb. 27, 1917. Adapted for wireless telephony.
- 1,264,517. ELECTRIC IMPULSE SENDER; Henry J. Herink, London, England. App. filed Dec. 23, 1916. Improvements.

Record of Electrical Patents

Notes on United States Patents

- 1,264,520. FLASHLIGHT BATTERY; Major E. Holmes, Lakewood, Ohio. App. filed March 2, 1914. Combination of a flashlight battery with a rheostat.

Co-operative Compensation Insurance

WHEN the workmen's compensation act became effective in New York State the public utilities were vitally interested. This, like other acts, was of rather uncertain portent. To a considerable extent it has worked to the advantage of the workman and also to the advantage of the insurance companies, which take no chance on a somewhat unfamiliar type of risk. As the situation developed the Utilities Mutual Insurance Company was organized as a measure of self-defense, and it has now more than a hundred electric and gas companies in its membership. The plan was to work on a thoroughly businesslike basis, forming a genuine mutual compensation company, working directly along this line without any side issues. It pursued the policy of charging the ordinary company premiums and then, after establishing adequate reserves and paying losses, distributing part of the surplus as a dividend to its members.

In this way the insurance was obtained on a basis at least no more disadvantageous than if it had been obtained in the open market, and, as in many cases of mutual organizations, it has proved that the actual net cost of insurance was very much below market rates. Part of this saving, 20 per cent or more, has been returned in the form of dividends for the last four years, besides leaving a substantial surplus. This success was undoubtedly due in a measure to the fact that the receipts were on the whole better than the average, and still more to the sound conservative management which furnished insurance at cost instead of at premiums exaggerated by enormous loads for the benefit of the stock company. These loads have in general to represent, not favorable conditions, but the worst which can possibly be encountered in the company's business, so that the advantage of co-operative working in a class of rather favorable risks is particularly obvious.

Not a little of the good result obtained is due to the instinctive feeling among all the participating companies that inspections and precautions to avert accidents would be directly to their benefit. The inspecting force was known to all participants as having for its fundamental motive, not blind adherence to a group of specifications intended to meet the worst possible conditions, but genuine interest in endeavoring to cut down the risks to which the member companies were exposed. Each company was examined at least twice a year, never twice in succession by the same man, and the recommendations made by the inspectors were directed closely to the lessening of danger. The scheme

entered into in a tentative way to try out a remedy for a difficult situation has "made good" on the face of the returns, and there is no reason to suppose that an extension of the activities of similar enterprise elsewhere will not likewise find a most encouraging reward.

Edison Medal Presented to Colonel Carty

THE presentation of the Edison medal last week to Col. John J. Carty met with universal acclaim, and the event is sure to be noted with satisfaction by all our readers. Colonel Carty, as the chief engineer of the American Telephone & Telegraph Company and as a junior past-president of the American Institute of Electrical Engineers, is known to electrical men all over the world. His contributions to telephone engineering have been numerous. As an organizer and administrator he has revealed great ability. His discernment, foresight and intuition in telephone engineering have been remarkable. Moreover, as a man he unites in an extraordinary degree the patient, persistent working power of the designing engineer with the sympathies and artistic instincts of the poet. He is the eighth on the list of eminent electrical men to receive the award of the Edison medal.

The occasion and ceremonies at the Institute meeting were brilliant and memorable. As our readers are informed, the results of the annual election for A. I. E. E. officers were announced. The president-elect, Prof. C. A. Adams, received a cordial welcome, and his brief address of acceptance and response met much applause. When Colonel Carty was escorted to the platform by Dr. Carl Hering, the chairman of the Edison medal committee, it was before a distinguished audience of ladies and gentlemen, among whom were many well-known telephone engineers, that the formal presentation was made. This was preceded by a eulogistic speech by Dr. Pupin, describing some of the recipient's well-known qualifications. E. W. Rice, Jr., the retiring president, delivered the medal and diploma. Colonel Carty's speech of acceptance displayed at once his characteristic modesty and his clear breadth of vision. He pointed out the great forces which telephony and telegraphy exert, and the yet greater forces which they are capable of exerting, for the world at large; also how much science and art, study, discipline and co-operation were needed in order to improve and maintain the service of telephony.

By good fortune both Dr. Alexander Graham Bell and General Squier were on the platform. Allusions to these well-known men and to their work drew repeated

applause. Dr. Bell was prevailed upon to make a short speech, which closed the proceedings very happily. The committee on arrangements deserved great praise for the excellence and precision of the function.

Electrical Transportation Can Help Win the War

AT OUR railway terminals, on our city streets, in our factory yards, we have got to handle and haul goods faster and cheaper. The central station has a vital part in this. It doesn't have to sell trucks; it doesn't have to sell conveyors; it doesn't have to spend money. All that is necessary is that every man from top to bottom shall see that electricity for power for transportation is to-day economically as sound as electricity for light and for motor drive, for domestic devices and electric furnaces; that the trucks and batteries of to-day are not the trucks and batteries of ten years ago; that gasoline and skilled men are getting scarcer except for primary war purposes, and that the self-propelled electric motor vehicle is succeeding on sheer intrinsic merit as the cheapest and simplest method of handling short-haul, many-stop deliveries.

Faster and cheaper methods of transportation will help win the war. The railroads are but one link in the transportation system that begins at the shipping platform of the factory and ends at the business warehouse and the customer's door. Our transportation system to-day needs help—real help—first, to make more efficient our present systems; second, to replace outgrown systems with newer and more economical methods.

The self-propelled vehicle is being demanded as an aid to rail transportation in government work, in munitions plants and in other essential war-time industries. The gas truck is called upon for actual army needs for long, rough transportation. The electric truck is needed for short-haul city transportation. The industrial storage-battery truck makers are swamped with business for this specialized transportation in mines, warehouses and factories. The short-haul, many-stop delivery systems are being analyzed by government boards and by individual business men, and the opportunity for heavy 5-ton electric trucks to-day has outstripped factory production. The specialized tractor field—the tractor for hauling wagons—is being developed, and fleets of light electric trucks for mail, express and merchandise deliveries have proved their economy over and over again.

The central stations are furnishing electricity for power and lighting for war work under many extraordinary conditions. They must furnish energy for transportation at a near date. As a load, it is well known, the battery charging meets war-time conditions. It is off-peak. Besides being good business to-day to promote electrical transportation methods, it is patriotic. Electricity is helping to win the war, in air photography, in wireless, in telephony, in big-gun firing on land and sea, and in the economical furnishing of energy for power, light and heat from a central station. To this we add, with peculiar importance at this time, the supply of energy for transportation. The electric trolley, the battery-driven industrial truck, the heavy-duty truck and the light delivery wagon are needed.

Self-Inductance of Short Reactance Coils

WHEN a coil has a core of non-magnetic material, such as wood or air, its self-inductance becomes a definite quantity and one which often assumes considerable practical importance. For example, in radio engineering the coils which carry high-frequency currents are ordinarily non-ferrous or have non-magnetic cores. It is often requisite to know their inductances. Again, large reactors with non-magnetic cores are now commonly installed in large central stations to limit short-circuit currents. Their inductances have to be predetermined during design, within reasonable limits of error. The inductance of any coil may be regarded as expressing the sum total of linkages of magnetic flux with that coil when it is excited by unit current.

Not long ago H. B. Dwight published in our columns a useful set of engineering formulas for deriving the inductance of a long coil. A coil may be defined as long for the present discussion when its axial length exceeds its mean winding diameter. Per contra, a coil whose axial length is less than its mean winding diameter becomes defined as a short coil. In this number Mr. Dwight contributes a similar set of useful engineering formulas for finding the inductance of a short coil. Three formulas are given, as well as a convenient curve sheet for approximate evaluation by inspection.

It may be noted that, as usual, the calculation can be simplified if the mechanical measurements of the coil are expressed in centimeters instead of in inches, because the numerical factor 0.3937 in the denominator of each formula then becomes replaced by unity, and if, further, the result is looked for in abhenries, instead of in henries, the denominator outside the main bracket in each formula disappears or is replaced by unity. This is merely another way of saying that since the henry, like all the international electromagnetic units, is a metric unit, it is simpler and swifter to use the metric system than the English system of units in electrical engineering calculations.

Great Market for Low-Priced Appliances

THERE has been a very large development of small motors for the application of electricity to small devices and appliances. To enumerate a few of the scores of devices now on the market is to suggest this tremendous growth. The fan, the hair drier, the vacuum cleaner, the washing machine, the ironer, the floor polisher are typical of home labor-saving appliances; the adding and calculating machine, the ventilating fan, the duplicating machine are samples of office and business devices; the coffee mill, the cash carrier, window display racks, intermittent signs are contrivances sold in increasing numbers in stores; and the industrial and specialized applications of small motors for tools in factories are as varied as industry itself. The universal motor, the motor that operates on both alternating and direct current, has been developed for these uses. But the field of application is barely scratched because these applications, with perhaps the exception of the fan, are relative luxuries to the average buyer.

The proportionate numbers of buyers for any com-

modity may be represented as a pyramid. At the apex are the few wealthy buyers to whom price makes relatively small difference in purchases. At the base are the utility buyers who have to match pennies with their wants of food, shelter and clothing. In between these extremes is a great middle class tapering in income toward the very rich at the top of the pyramid and toward the very poor at the base. The bulk of the merchandise that makes any pretense of having convenience as well as utility value is sold to this middle-class group. Very few electrical contrivances are priced in this field, for two reasons—first, because the first market has been in the relative luxury class; second, because the small volume of sales has made costs high.

All this is background for the small-motor designer. In our industry electrical design is linked very closely with merchandising demand, because electrical design gets at the root of costs, costs have definite relation to price, and price has a definite relation to sales volume. So we complete the circle and get back to design. We need to-day, and will need increasingly, good small motors that can be built and sold more cheaply, not because costs are too high for present markets, but because if we are to get down into the bulk utility markets we must have five-dollar, ten-dollar and fifteen-dollar motor-driven appliances. In many of these devices the motor is 50 per cent or more of the assembled factory cost. Our small-motor designers have done some remarkable things. There are certain irreducible relations between copper and iron to get output. There are definite limits of efficiency. But our designers have the problem of scaling efficiency and cost in such proportions that, given quantity production, a good small motor can be produced which will put the small power appliances in the great middle-class buying group.

Precautions to Insure Safety in Switching

THE article by M. M. Samuels and F. N. Bechoff in the current issue is full of practical ideas for the assurance of safety in performing various switching operations and of plans for interlocking the various devices so that they cannot be mishandled. The diagrams of safety and interlocking devices which the authors give will be found very suggestive by those who are dealing with switchboard design. The fact is that switchboard design is a fine art rather than a science and one which even now is in anything but its final stage of development. There are plenty of standard panels for ordinary purposes which leave little to be desired in completeness; but a standard panel

is not a switchboard, neither is it a simple proportional part of the switchboard, and when it comes to laying out the various interconnections for a considerable station there is room for exercise of indefinite ingenuity. It is in the organization of a complete switching system that practical hints like those in the present article will prove of a good deal of service, not only in themselves, but in suggesting still further possibilities of lessening risks and providing a more easily worked switchboard equipment. The interlocking idea in particular is worth development. For example, it is perfectly practicable to use for certain purposes simple and cheap auxiliary switches provided that they are not expected to open the circuit under heavy load. If interlocked so that this particular thing cannot be done, the cost of an expensive oil switch may be saved to the plant.

The only danger lies in carrying the elaboration of safety devices so far that the entire system gets more complicated instead of less so. One cannot entirely eliminate human intelligence in the operation of a switchboard, and it sometimes seems to us a question as to whether an attempt to do so is not likely to lead to too much blind confidence in things going right even if the operator does not think. In certain cases—for instance, the operation of an automatic substation—the working of the switching apparatus must be completely automatic. The distant operator pushes a button, and the motor it controls does the rest. If one tries to reduce an entire switchboard to this condition, there is still left the chance of the operator pushing the wrong button and starting the wrong irrevocable train of operations into action, losing time if nothing worse. Here, as everywhere else, the human equation cannot be eliminated, and a sense of personal responsibility may be a more valuable factor in safe and successful operation than mechanical contrivances of too complicated a nature.

We are quite disposed, therefore, to believe that in the long run the best policy is to work assiduously in the direction of extreme simplicity in the general layout of the switchboard, thereby decreasing not only the labor of the operator but the chances of his doing the wrong thing. These chances may be still further diminished by intelligent use of safety devices and by employing fully automatic switching apparatus when, and only when, it really makes for simplicity instead of complication. In old stations grown by a process of aggregation complication cannot be avoided and there is free scope for the exercise of much ingenuity in providing for safe operation. In new stations the watch dog of the treasury ought to be on guard over the switchboard designer, ready to show his teeth at the first symptom of unneeded intricacy.

IF ALL of the brass and bronze in the United States were to be melted in electric furnaces, the annual consumption of energy would be about 200,000,000 kw.-hr. and the generating capacity required would be about 75,000 kw. These figures give some idea of the importance to user, manufacturer and central station of knowing the fundamental principles which govern the success of electric brass melting. These will be outlined in a coming issue in which the relative merits of different types of

The Coming Issues

furnaces will be discussed and the central-station viewpoint presented. Among other articles that will appear shortly will be one telling what types of lighting units or layouts are best suited for protective lighting purposes and another describing some interesting long-span construction leading up the side of a mountain broken by ravines and covered with tall trees. The second and concluding installment of Prof. N. S. Diamant's article on "Sudden Short Circuits of Alternators" will appear in the next issue.

Determination of Economical Power Circuits

Method of Deriving Curves Which Show the Most Economical Wire Size When the Cost of Copper Wire, the Cost of Energy at the Switchboard, the Equivalent Hours During Which Load Is on Circuit and the Maximum Current Are Known

BY P. O. REYNEAU

Distribution Engineer, Detroit Edison Company

IN AN article* previously published an attempt was made to determine the economical size of feeders for a load consisting of residence and store lighting. These feeders were single-phase and carried a uniform load throughout their length, being the link between the substation and the distribution center. The analysis was made on the basis of the peak load intended to be carried on these feeders and what was called the "equivalent" hours that the load was carried on them. The equivalent hours times the maximum current squared is approximately equal to the actual I^2r loss due to the varying current throughout the day.

Here the same general method will be used for three-phase circuits carrying power load and a very small amount of factory lighting. As previously established, the most economical size of wire is that for which the sum of the fixed charges and the energy losses at the switchboard cost is a minimum. This sum represents the annual charges.

The current that can be carried on these circuits is limited by the current-carrying capacity of the cables feeding out of the substations, which are 200,000-circ. mil three-wire cables. Various sizes of wire are considered, No. 0000 being taken as the largest size that can be handled on existing pole lines without special

D = distance of transmission in thousands of feet.
If

g = per cent interest and depreciation,

W = weight per foot of wire,

C_c = price of copper wire per pound,

H = cost of stringing 1000 ft. of line,

I = maximum current carried,

ρ = resistivity of wire in ohms per mil-foot,

A = area of wire in circular mils,

t = equivalent hours per day peak load is on,

C_e = cost of energy per kilowatt-hour,

and working days are taken as three hundred per year.

The formula for annual charges becomes:

$$\begin{aligned} \text{Annual charges} &= [(g/100)(3000 \times W \times C_c + H) + \\ &\quad I^2 \times (\rho/A) \times 3000 \times t \times 300 \times \\ &\quad (C_e/1000)]D \\ &= [30gWC_c + (gH/100) + \\ &\quad 900I^2(\rho/A) \times t \times C_e]D. \end{aligned}$$

Assuming that for one size of wire $W = W_1$ and $A = A_1$, and for the next larger size $W = W_2$ and $A = A_2$, then:

$$\text{Annual charges (1)} = [30gW_1C_c + (gH/100) + 900I^2(\rho/A_1)t \times C_e]D.$$

FIGS. 1 AND 2—ECONOMICAL SIZE OF CONDUCTOR FOR THREE-PHASE POWER CIRCUITS WITH ANY RATIO BETWEEN COPPER AND ENERGY COST. FIG. 1 HOLDS FOR ANY VALUE OF EQUIVALENT HOURS, FIG. 2 APPLIES WHEN EQUIVALENT HOURS EQUAL 9.69

reinforcement. In this manner the pole-line cost is considered the same for all sizes of wire and could be eliminated in the calculations.

The annual charges may be represented as follows:

$$\text{Annual charges} = (K_1 + K_2)D.$$

Where K_1 = annual fixed charge per 1000 ft. of line
 $= (g/100)(3000 \times W \times C_c + H)$

K_2 = annual copper loss per 1000 ft. of line
 $= I^2(\rho/A) \times 3000 \times t \times 300 \times C_e / 1000$

$$\text{Annual charges (2)} = [30gW_2C_c + (gH/100) + 900I^2(\rho/A_2)t \times C_e]D.$$

If these two quantities are equated, a point is obtained where it is as economical to use either wire size, considering the same C_c , C_e , I and t .

$$\begin{aligned} \text{Annual charges (1)} &= \text{annual charges (2)} \\ [30gW_1C_c + (gH/100) + 900I^2(\rho/A_1)t \times C_e]D &= \\ [30gW_2C_c + (gH/100) + 900I^2(\rho/A_2)t \times C_e]D \end{aligned} \quad (1)$$

Since C_c and C_e are not constant and I and t depend on the load, it is advisable in order to make the equa-

*See ELECTRICAL WORLD, Dec. 15, 1917, p. 1142.

tion most usable to solve equation (1) for the ratio of C_e/C_c , thus leaving two troublesome variables in a convenient form for substitutions.

Then:

$$30gC_e(W_1 - W_2) + 900I^2 \times C_c \varphi [(1/A_1) - (1/A_2)] = 0;$$

or

$$C_e/C_c = \frac{900 \times \varphi \times [(1/A_1) - (1/A_2)] \times I^2}{30g \times (W_1 - W_2)}$$

$$= \frac{30\varphi(A_1 - A_2)}{g \times A_1 A_2 (W_1 - W_2)} \times I^2,$$

or, equating the expressions

$$K = \frac{30\varphi(A_1 - A_2)}{g \times A_1 A_2 (W_1 - W_2)}$$

A constant for each size of wire under consideration can be obtained, leaving only the four main variables to be considered $C_e/C_c = KI^2t$, as follows:

$$K_1 = \frac{30 \times 10.8 \times (211,600 - 167,800)}{8 \times 211,600 \times 167,800 (0.6405 - 0.5079)} = 0.000378 \text{ (No. 000 to No. 0000).}$$

$$K_2 = \frac{30 \times 10.8 \times (167,800 - 133,100)}{8 \times 167,800 \times 133,100 (0.5079 - 0.4028)} = 0.000596 \text{ (No. 00 to No. 000).}$$

$$K_3 = \frac{30 \times 10.8 \times (133,100 - 105,500)}{8 \times 105,500 \times 133,100 (0.4028 - 0.3195)} = 0.000955 \text{ (No. 0 to No. 00).}$$

$$K_4 = \frac{30 \times 10.8 \times (105,500 - 83,690)}{8 \times 105,500 \times 83,690 (0.3195 - 0.2533)} = 0.00151 \text{ (No. 1 to No. 0).}$$

$$K_5 = \frac{30 \times 10.8 \times (83,690 - 66,370)}{8 \times 83,690 \times 66,370 (0.2533 - 0.2009)} = 0.002415 \text{ (No. 2 to No. 1).}$$

With the equation in the above form it is possible to substitute for all the variables with the exception of t , which still remains to be determined. It is naturally assumed that a careful analysis has been made to ascertain the best cost of copper and of energy at the substation switchboard, or better still at the cable pole to be used in the substitution.

There are two courses open with regard to the equivalent hours or t to be used: First, an analysis of the power load on the system in question may be made to determine an average t to be used in the design of all power circuits. This was done here by analyzing the power load curve of the system, taking two typical days in each month of one year. If t_e = equivalent hours, I = average current for each hour, I_m = maximum current for the day, then the equivalent hours for one day can be represented as follows:

$$t_e = (\Sigma I^2 R) / (I_m^2 R) = (\Sigma I^2) / (I_m^2) \text{ or } = [\Sigma (\text{kva.})^2] / [(\text{kva.}_{max})^2],$$

these two quantities being proportional to one another. Then, having the equivalent hours for each one of the twenty-four typical days of the year, an average can be obtained for the equivalent hours for the year. Fig. 3 gives a graphical representation of this process. By the preceding method 9.69 hours was found to be the equivalent hours for the various circuits of the system in question. Fig. 1 gives the means of finding the economical size of wire on that basis.

Secondly, to make the proposition absolutely general,

curves can be plotted (Fig. 2) with C_c , C_e as abscissas and the quantity I^2t as ordinates, thus giving all possible combinations of the four variables C_c , C_e , I and t for the conditions previously described. The equation this time is a straight line.

The first set of curves serves as a general guide for average power circuits. It is best to use them on circuits where the character of the load is uncertain or when it is liable to change from time to time. The second set of curves allows of more refinement of design. In this case each power circuit can be designed separately if definite information or if plausible assumptions are available for determining the actual values of the equivalent hours. To do this it would be necessary to know the kind of load carried, its variation during the working hours and the working hours per day or the number of shifts. Serious error might result from assuming 9.69 as the average equivalent hours for a variable load, such as welders, or for a factory load running normally two or three shifts a day, such as furnace load, etc. Therefore the curve would be of service wherever a special analysis is possible, and the over-all efficiency of the system of power circuits would be greatly increased by separate study of each one.

So far only power circuits carrying the same load throughout have been considered, such as would exist with one large customer on the circuit. If the power circuit has several customers on it, and if it has

FIG. 3—EQUIVALENT HOURS PER DAY TAKEN FROM SYSTEM LOAD CURVES FOR ONE YEAR

branches, the load carried on each section of the circuit and on each branch should be analyzed and the most economical size of wire determined for each one of these parts. It is also possible to determine or make a plausible assumption of the equivalent hours for each part or branch.

Finally, it should be brought out that these curves only furnish a basis for obtaining the best economies in a system of circuits. They are sufficient in themselves for each circuit if the four variables C_c , C_e , t and I are known. They can only assist and guide in the design of a system of power circuits. The reasons are obvious and dictated by the quality of service to be furnished. In present-day practice, switching facilities and throw-over facilities are absolutely necessary in case of trouble and in many cases would demand wide divergence from the data obtained from the curves. However, if the correct relations between all the elements of power-circuit design that can be measured in tangible quantities can be established, the engineer is freer to work out his combinations and more apt to choose correctly the other elements, such as quality of service, etc., that cannot be measured in such exact sets of units.

ECONOMY OF CROSS-CONNECTED REVERSE-POWER RELAYS

Little Control Wiring Is Necessary—Practically Instantaneous Action Obtained—Relays Operate on Small Currents

WHEN the balanced system of relay protection is too expensive to employ on a network of feeders, cross-connected reverse-power relays may be used as shown in Figs. 1 and 2. In the particular example shown the relays are applied to a system consisting of a generating station and a substation connected by four parallel feeders. By referring to the diagrams mentioned it may be noted that all of the current transformers in the generating station and substation are connected in series and that each relay, which must be a reverse-power (unidirectional) relay, is shunted across its current transformer. This arrangement can be used with equal success in any part of a complicated network if the feeders are in parallel. While the cables in parallel should be alike in characteristics, any differences in their impedance can be easily compensated.

Under normal conditions the load in each of the cables

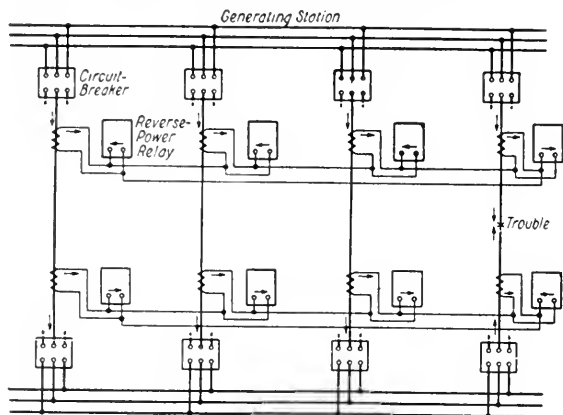

FIG. 1—SCHEMATIC DIAGRAM OF CROSS-CONNECTED SYSTEM SHOWING ONLY ONE PHASE OF EACH FEEDER

will be the same. Since the relays have a higher impedance than the current transformers, the current from the latter will therefore circulate through all of them in series without any flowing through the relays. If trouble occurs at any point outside the section protected by the cross-connected relays, the current through the cables will still be balanced; consequently there is no force tending to operate the relays. On the other hand, if trouble occurs on a cable within the section, the current through the defective cable will be higher than that in the others; therefore the excess current from the current transformers must pass through the relays. While under this unbalanced condition current will flow through all the relays, the current is in the proper direction to cause the opening action to occur only in the relays at each end of the defective cables.

The pallet switches shown connected in the transformer secondary circuit are also connected mechanically to the operating mechanism of the circuit breaker so that when the breaker opens the current transformers on the circuit controlled thereby will be short-circuited. Consequently a cable can be cut out of service without interfering with the electrical balance.

By referring to Fig. 1 it may be noted that when the cross-connected scheme is used on only two cables the two sets of relays are actually in parallel and will

operate in the opposite directions. The expense of the two-cable cross-connected system can be reduced by using, in place of the two sets of reverse-power relays as shown in Fig. 3, one set of special relays having two contacts, one to close when power flows in one direction, and the other in the reverse direction.

Among the advantages of cross-connected reverse-

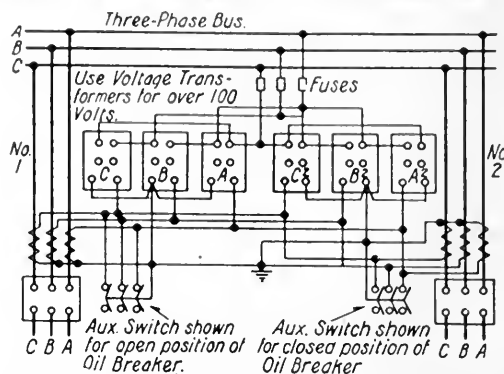

FIG. 2—THREE-PHASE CONNECTIONS WITH AUXILIARY SWITCH ATTACHED TO CIRCUIT BREAKER

power relays are the following: Practically instantaneous action is obtained; they can be set to operate on smaller currents than the full load current of each feeder, and they do not require change of adjustments each time generating systems are cut in or out.

The use of cross-connected relays or double-contact reverse power relays does have some of the disadvantages of balanced systems in that if trouble occurs on the busbars or on all of the feeders simultaneously it cannot be automatically cleared. In addition, some difficulty may be encountered when it is attempted to cut in a new feeder. When the feeders are heavily loaded and an attempt is made to close the switch in the substation end first, the new feeder will be tripped out, whereas if it is closed in the generating end first the feeders carrying the load will be tripped out.

However, the difficulty mentioned may be overcome if the overload elements are given so high a setting that the normal load current cannot possibly operate them. Such a change would, of course, eliminate the advantage

FIG. 3—DOUBLE-CONTACT REVERSE-POWER RELAY APPLIED TO DUPLICATE FEEDERS

that the system can operate on small currents. The possibility of the breaker being tripped out when in a new feeder can be overcome by mechanically or electrically holding the substation relay while "cutting in" first at the substation and then at the generating station.

This scheme has been worked out by engineers of the Westinghouse Electric & Manufacturing Company.

Safety Features in Switching Installations

Interlocking of Disconnecting Switches, Circuit Breakers and Synchronizing Plugs Recommended—Best Locations for Pilot Lamps and Preferred Construction—Weaknesses of Auxiliary Switches and Relays

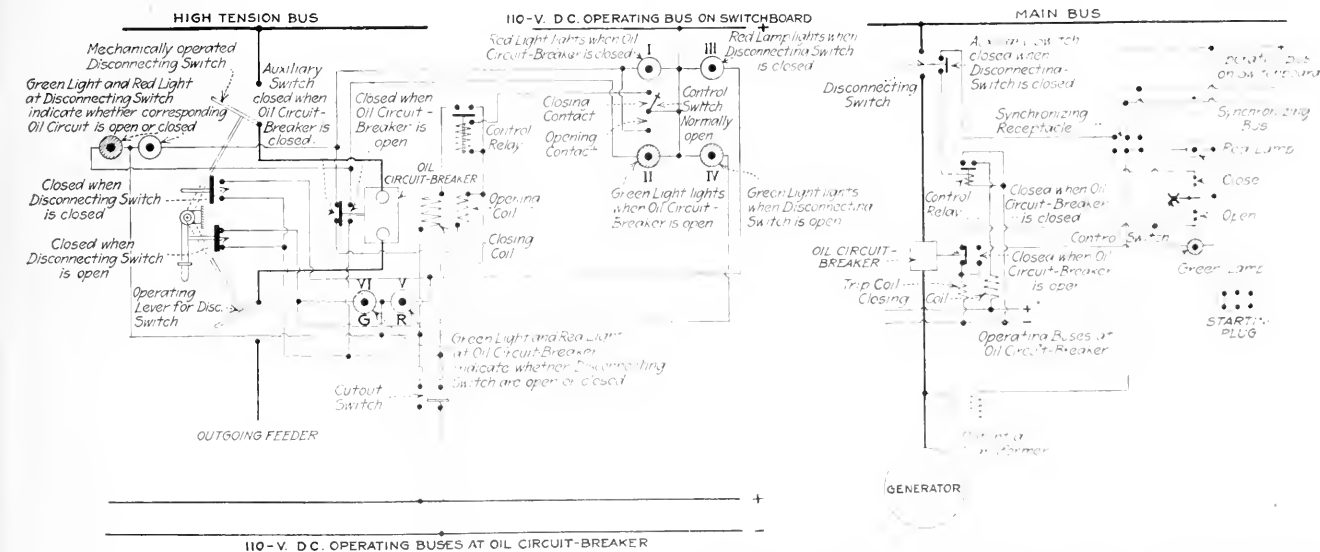

BY M. M. SAMUELS AND F. N. BECHOFF

JUST a few of the many ideas that can be embodied in electric switching installations to make operation safer for the apparatus as well as the attendants were mentioned in a previous article¹ by the authors of this paper. Some additional points will be emphasized in this article. Among the subjects which will be discussed are the best location for indicating, or pilot, lamps and the construction to be preferred; the possibility and value of interlocking circuit breakers, synchronizing devices and disconnecting switches when the latter are operated by mechanisms instead of by switch hooks; methods of protecting transformers; electrical versus mechanical interlocking of switches which must not be closed simultaneously, and weaknesses of auxiliary switches and relays.

In order to remove as much uncertainty as possible regarding the open or closed condition of oil switches and disconnecting switches when they or their respective circuits must be inspected or repaired, indicating lamps can be permanently placed at the points from

It is not advisable to use exposed colored bulbs for the pilot lamps, since they are easily damaged and since an operator when renewing lamps might accidentally place a green bulb in a socket intended for a red bulb and vice versa. White bulbs installed in a metal box with red and green lenses in the cover are preferable; the cover should be constructed in such a way that the red and green lenses cannot be interchanged. Details of a box, with lamps and lenses, which fulfills these requirements and allows ample space for the necessary conduit connection and wiring are shown in Figs. 6, 7 and 8. A barrier is provided between the two bulbs so that they can illuminate only their respective lenses. To identify the circuits a name plate can be affixed to the cover.

In addition to providing for the interlocking of oil-circuit-breaker control and synchronizing circuits,² it is possible, when using mechanically operated disconnecting switches, so to interlock the control circuit with the mechanism of the disconnecting switch that it is

FIGS. 1 AND 2—INDICATING LAMPS ON SWITCHBOARD AND AT OIL CIRCUIT BREAKER AND MECHANICALLY OPERATED DISCONNECTING SWITCH THAT PREVENT FAULTY OPERATION; METHOD OF INTERLOCKING CIRCUIT BREAKER CLOSING CIRCUIT WITH SYNCHRONIZING RECEPTACLE AND AUXILIARY SWITCH

The arrangement shown in Fig. 1 is feasible only with disconnecting switches operated by mechanisms; the connections indi-

cated in Fig. 2 prevent the closing of the oil circuit breaker when the disconnecting switch is open.

which they are controlled and at the switch positions too. This is not impracticable if the disconnecting switches are operated by mechanical devices instead of hook switches and are provided with auxiliary switches to control the indicating lamps.

An arrangement which will suggest how this idea can be carried out is shown in Fig. 1, desirable locations for the pilot lamps being indicated in Fig. 3. This scheme can be employed with outdoor open structures as well as with indoor compartment structures.

impossible to close the oil circuit breaker unless the disconnecting switch has previously been closed. A method of securing this desirable feature is indicated in Fig. 2.

Even if indicating lamps are used, it may happen that an operator, after having adjusted the speed of a generator to secure synchronism, will close the oil circuit breaker, only to discover that the disconnecting switches are still open. If an operator were sent to close the disconnecting switches and he accidentally did so before the other operator reopened the oil circuit

¹"Safety Features in Switching Apparatus," by M. M. Samuels and F. N. Bechhoff, ELECTRICAL WORLD, Vol. 71, p. 656.

²Fig. 5, page 657, ELECTRICAL WORLD, Vol. 71

cut breaker, serious damage might result as a generator would then be connected to a bus with which it was not in synchronism.

When disconnecting switches are used as bus-selector switches (Fig. 4) it may happen, when attempting to

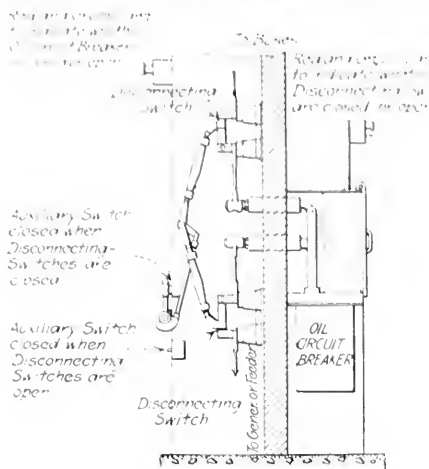

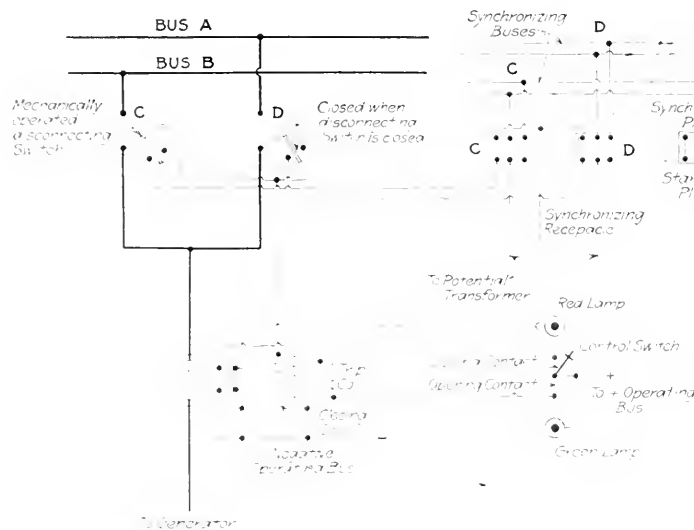

FIG. 3—PROPER LOCATION OF RED AND GREEN INDICATING LAMPS ON SWITCH STRUCTURE. INDICATING LAMPS ARE OPERATED BY AUXILIARY SWITCHES ON OIL CIRCUIT BREAKERS AND MECHANICALLY OPERATED DISCONNECTING SWITCHES

synchronize two systems, that the wrong disconnecting switch will be closed. If this condition exists and the operator closes the oil switch after apparently synchronizing the two circuits he expects to connect, two buses will be connected which may be entirely out of phase. This would not be liable to happen with mechanically operated disconnecting switches having pilot lamps on the board from which the oil switches are controlled. Absolute safety would be assured if the disconnecting switches, circuit breaker and synchronizing plug were

FIGS. 4 AND 5—SYNCHRONIZING CONNECTIONS SUITABLE WITH TWO SETS OF BUSBARS AND ONE OIL SWITCH; SIGNAL LAMPS AT HIGH-RATED TRANSFORMER TO INDICATE WHETHER TRANSFORMER IS DISCONNECTED ON BOTH SIDES OR NOT

Interlocking of the synchronizing connections with the auxiliary switches and mechanically operated selector disconnecting switches as shown in Fig. 4 prevents throwing of generator on bus with

electrically interlocked so that the circuit breaker could not be closed unless the disconnecting switch corresponding to the position in which the synchronizing plug was placed were closed.

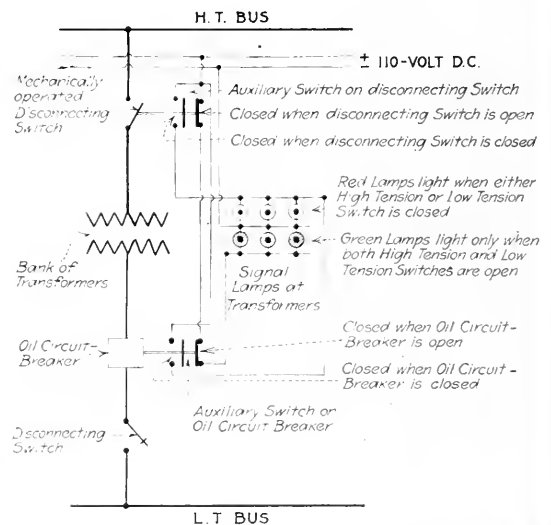

Some liability insurance companies now require that red and green lamps be placed near each transformer of high rating or high voltage and so connected that the

red lamp will indicate when the switch on either the high-tension or the low-tension side of the transformer is closed and that the green lamp will indicate when both the high-tension and low-tension switches are open. This can be accomplished very easily with the connection shown in Fig. 5. The two auxiliary switches controlling the red lamps are connected in multiple, while the two auxiliary switches controlling the green lamps are in series. Where each transformer is installed in a separate compartment it is advisable to provide signal lamps (Fig. 5) outside of the compartment near the door.

FIGS. 6, 7 AND 8—SIGNAL BOX FOR RED AND GREEN INDICATING LAMPS ON SWITCH STRUCTURES; BARRIER PREVENTS ONE LAMP FROM ILLUMINATING BOTH LENSES; UNSYMMETRICAL HINGED COVER PREVENTS INTERCHANGEABILITY OF COLORS

All modern high-rated transformers are now equipped with dial thermometers, which indicate the transformer temperature. Some have a contact to ring a bell alarm when the temperature exceeds a given limit. A second contact may be attached to such thermometers in order to trip the transformer oil circuit breaker when the temperature rises above a certain limit. This is particularly advisable when a transformer is placed far enough from the operator to cause danger of the transformer burning out in the interval of time between re-

which it is not in synchronism; all auxiliary switches in Fig. 5 operating red lamps are connected in multiple, whereas the auxiliary switches controlling the green lamps are connected in series.

ceiving an alarm and reaching the transformer. Where the transformer is so situated means should also be provided for the operator to trip the circuit breaker from a point near the transformer if an occasion should arise making it necessary. A scheme which will provide such safety features is illustrated in Fig. 9.

Usually water-cooled transformers are equipped with

flow indicators which can be electrically connected with the temperature indicator alarm circuit so that interruption of water circulation will automatically give an alarm. When thermometers are used in connection with transformers they should be so installed that it will not be necessary for an operator to climb a lad-

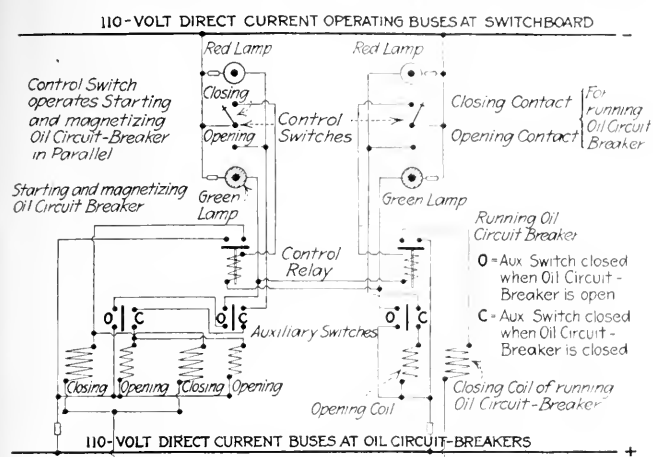

FIG. 9—SYSTEM OF CONNECTIONS FOR INTERLOCKING STARTING, MAGNETIZING AND RUNNING SWITCHES OF LARGE MOTORS; PROPER OPERATION OF INTERLOCKING CONNECTIONS DEPENDS ON RELIABILITY OF AUXILIARY SWITCHES

der in order to read the temperature. Use of contact-making thermometers will eliminate this objection.

Up to the present time, so far as the authors know, there has not been developed an auxiliary switch for oil circuit breakers and other apparatus which is adequate for all purposes. Considering the fact that the operation of nearly all safety devices in power houses and substations depends chiefly on the proper and reliable operation of auxiliary switches, it is obvious that even with modern indicating and automatic safety devices there cannot be a high degree of safety unless

known to the authors, it is sometimes necessary to use multiple contacts, but this precaution does not always prevent auxiliary switch trouble. Usually there is an auxiliary switch in the tripping circuit of each circuit breaker, and if this switch fails the circuit breaker will fail to open when overloaded or short-circuited, thus causing considerable damage to the transformers and other apparatus connected therewith.

The interlocking of circuit breakers to prevent the simultaneous closing of two or more of them where such simultaneous closing would be dangerous is usually accomplished by auxiliary switches. For instance, when large motors are started by means of a compensator a magnetizing switch, a starting switch and a running switch are provided. It is important that the control circuits of these three switches be interlocked so that the running switch cannot be thrown in until the motor is brought to speed by the magnetizing and starting switches. It is of even greater importance not to have the starting and running switches both closed at the same time, since under this condition the compensator would burn out. Interlocking to prevent such trouble may be accomplished with hand-operated switches by mechanical means, but with electrically operated oil circuit breakers it is necessary to interlock the control circuits electrically by means of auxiliary switches unless the control switches are mechanically interlocked. Although interlocking of the control circuits gives a more flexible arrangement, it cannot be considered the safest method unless a thoroughly reliable auxiliary switch is employed. The connections for electrically interlocking oil circuit breakers used in starting either synchronous or induction motors are shown in Fig. 10.

What applies to auxiliary switches is likewise true of relay contacts. Although progress has been made in the design of various types of relays, their contacts

FIGS. 10 AND 11—TEMPERATURE AND WATER-FLOW ALARM CONNECTIONS FOR TRANSFORMER; FOUR-WIRE CONTROL CIRCUIT FOR OIL SWITCHES

An additional contact is provided on the transformer temperature alarm for tripping the circuit breakers at excessive temperatures; an emergency tripping switch is also provided at the trans-

former. In Fig. 11 the push-button is in the opening side of the control circuit.

a standardized, practically infallible auxiliary switch is developed. Auxiliary switches which may have been perfectly satisfactory for apparatus used in the past are not at all adequate for modern circuit breakers because their rupturing capacities and velocities of operation have both been increased. All auxiliary switches should be easily accessible for connection, inspection and repair. Owing to unreliability of auxiliary switches

should be further improved, since the majority of modern relay contacts are unable to carry the current required to trip large circuit breakers. Often it becomes necessary to resort to auxiliary relays, which are only an additional evil, because the size of nearly all relays is restricted by the secondary ampere rating of the current transformers, which generally does not exceed 5 amp. White 5-amp. secondaries are sufficient on cur-

rent transformers for use with meters and also for operating automatic devices on circuits of low capacity, they are hardly suitable for oil circuit breakers of high rupturing capacity. Therefore it is suggested that the secondary rating of current transformers for such protective purposes be increased. When this is done it will be possible to develop relays with contacts of adequate size. While the same current transformer is suitable for both the meters and relays in small installations, two separate sets of current transformers are advisable in large installations: One set should be used for the meters and the other for automatic relay protection. With this arrangement it is obvious that an increase in the rating of the secondaries of the relay current transformers would not destroy the accuracy

of the meter reading, a consideration of importance.

It is still customary to install all relays on the switchboard, this arrangement being necessary because the present relays require constant attention and frequent inspection and adjustment. With current transformers having a higher secondary rating it will be possible to design relays of large sizes and more rugged construction. Such relays would not have to be mounted on the switchboard but could be placed near the oil circuit breakers or other apparatus which they are to protect, thus eliminating unnecessary conduits and wiring and minimizing the switchboard space necessary.

In conclusion, provisions should be made for disconnecting control devices from the control bus to permit repairing and inspection.

Self-Inductance of Short Reactance Coils

Formulas Which Can Be Applied with Accurate Results to Calculate Self-Inductance of Thick Coils—Curves Based Upon These Formulas and Methods of Using the Information That Is Thus Derived

BY H. B. DWIGHT, CANADIAN WESTINGHOUSE COMPANY

IN CALCULATING the self-inductance of commercial reactance coils it is useful to have formulas which make special allowance for the thickness of the winding, which is considerable in usual types of coils, such as current-limiting reactors, paralleling coils for transformers and the coils used with reactance-type circuit breakers. In this article formulas are given for coils whose length is shorter than their mean diameter. These formulas are similar to those for long thick coils which were recently published in the ELEC-

FIG. 1—SHORT THICK COIL ON WHICH CONCLUSIONS ARE BASED

TRICAL WORLD¹ and with them cover the complete range of circular coils.

The formulas for self-inductance of short coils are derived from an expression for the mutual inductance of two coaxial circles. This was given in the form of a convergent series by Maxwell,² and the series has been extended by E. B. Rosa and L. Cohen.³ More recently, a further extension has been made by T. R. Lyle,⁴ who has used the series to obtain a formula for the self-inductance of a short thick circular coil by means of a method involving Taylor's theorem.

The same formula for thick coils, to the fourth power of the dimensions, has been derived by the writer by two other independent methods, and thus a check has been made on the accuracy of the terms up to and in-

cluding the fourth power. By the first of these methods the series for the mutual inductance of two circles was integrated to give the mutual inductance of two coaxial and concentric thin solenoids of equal length. This expression was then integrated over the section of the thick coil indicated in Fig. 1, giving the formula for the self-inductance of the coil. The other method, which gave the same result, consisted in integrating the series for two circles so as to give the mutual inductance of two equal thin disks on the same axis. Then this expression was integrated over the section of the coil to give its self-inductance.

The above-mentioned self-inductance formula is very suitable for precision calculations, especially when the terms of the sixth power are included. These were worked out by Dr. Lyle and published in an appendix to his article referred to above. But the formula is extremely long for engineering work, and it can be considerably simplified by expanding some of the terms, such as $\log x$ and $\tan^{-1}x$, into series. Good accuracy is obtained for thick coils whose length is as great as their diameter by keeping all terms up to and including the fourth power of the dimensions.

For short coils, in which the length b (Fig. 1) is less than the mean diameter d but greater than the thickness c , the precision formula can be expanded in terms of c/b as follows:

L , in henries =

$$\frac{2\pi dN}{0.3937 \times 10^9} \left[\left\{ \log h \frac{4d}{b} \right\} \left\{ 1 + \frac{1b^2}{8d^2} + \frac{1c^2}{24d^2} - \frac{1}{64} \left(\frac{b^4}{d^4} - \frac{7b^2c^2}{6d^4} - \frac{11c^4}{45d^4} \right) \right\} + \frac{1c^2}{6b^2} \left(\log h \frac{b}{c} \right) \left(1 - \frac{1c^2}{20d^2} \right) - \frac{1}{2} - \frac{\pi c}{3b} + \frac{1c^2}{8d^2} + \frac{1b^2}{32d^2} + \frac{25c^2}{72b^2} + \frac{1}{96} \left(\frac{b^4}{d^4} - \frac{19b^2c^2}{8d^4} + \frac{8c^4}{15b^4} - \frac{67c^4}{75b^2d^2} + \frac{17c^4}{40d^4} \right) + \frac{1}{qN} \left(\log h \frac{p}{w} + 0.14 \right) \right] \quad (1)$$

¹"The Self-Inductance of Long Reactance Coils," by H. B. Dwight, ELECTRICAL WORLD, Feb. 9, 1918, p. 300.

²"Electricity and Magnetism," Vol. II, para. 705.

³"Bulletin of the Bureau of Standards," Vol. 2, 1906, No. 3, page 366.

⁴"Philosophical Transactions of the Royal Society of London," Vol. 213, 1913, page 421.

For flat coils, in which the axial length b is less than c , the expansion can be carried out in terms of b/c , as follows:

L , in henries =

$$\frac{2\pi dN^2}{0.3937 \times 10^9} \left[\left\{ \log \frac{4d}{c} \right\} \left\{ 1 + \frac{1b^2}{8a^2} + \frac{1c^2}{24d^2} - \frac{1}{64} \left(\frac{b^4}{a^4} - \frac{7b^2c^2}{6a^4} - \frac{11c^4}{45a^4} \right) \right\} + \frac{1b^2}{6c^2} \left(\log \frac{c}{b} \right) \left(1 + \frac{1b^2}{4d^2} + \frac{1b^2c^2}{4a^2} \right) - \frac{\pi b}{3c} \left(1 + \frac{1b^2}{5d^2} + \frac{1b^2c^2}{15d^4} - \frac{2b^4}{35d^4} \right) - \frac{1}{2} + \frac{1b^2}{8d^2} + \frac{25b^2}{12c^2} + \frac{43c^2}{288d^2} + \frac{1}{96} \left(\frac{16c^4}{25d^4} - \frac{1b^2c^2}{24d^4} + \frac{8b^4}{15c^4} + \frac{23b^4}{3c^2a^2} + \frac{31b^4}{24d^4} \right) + \frac{1}{qN} \left(\log \frac{p}{w} + 0.14 \right) \right] \quad (2)$$

$w = 0.08$ cm. The mean diameter of the coil is $d = 10$ cm., the length is $b = 10$ cm., and the thickness is $c = 1$ cm.

The self-inductance L , of a thin coil of diameter $d = 10$ cm. is given by formula (1) by omitting the terms in c and the last bracket.

Thus,

$$L_s = (2\pi \times 10 \times 10^3) / 10^9 [1.386(1 + 0.125 - 0.0156) - 0.5 + 0.0312 + 0.0104] = (\pi/100) \times 2.159 \text{ henries.}$$

The other terms of formula (1) are

$$(2\pi/100) [1.386(0.00042 + 0.00018) + 0.0038 - 0.1047 + 0.00125 + 0.0035 - 0.0002 + 0.00036] = -(\pi/100) \times 0.190.$$

Therefore the self-inductance of the coil is

$$(\pi/100) \times 1.969 = 0.06185 \text{ henry.}$$

The self-inductance of the same coil, calculated by the

FIGS. 2 AND 3—CURVES FOR DETERMINATION OF THE SELF-INDUCTANCE OF REACTANCE COILS

For coils of square section, in which b is equal to c , the formula becomes

L , in henries =

$$\frac{2\pi dN^2}{0.3937 \times 10^9} \left[\left\{ \log \frac{4d}{c} \right\} \left\{ 1 + \frac{1c^2}{6d^2} + \frac{37c^4}{5760d^4} \right\} - 1.1949133 + 0.146293 \frac{c^2}{d^2} - 0.010860 \frac{c^4}{d^4} + \frac{1}{qN} \left(\log \frac{p}{w} + 0.14 \right) \right] \quad (3)$$

For this case formulas (1) and (2) will also solve the problem. Therefore formulas (1) and (2) are sufficient for calculating with ordinary accuracy the self-inductance of thin or thick cylindrical coils whose axial length is shorter than their mean diameter.

The self-inductance of both long and short reactance coils is plotted in Figs. 2 and 3, which are curves for coils of various thicknesses. These can be used for obtaining approximate values of inductance and for making a check on calculations. However, more accurate values will often be required that can be obtained from the curves, and direct calculation by the formulas will be necessary.

Problem I.—To find the self-inductance of a coil wound with 1000 turns of round wire in ten layers of 100 turns each. The diameter of the insulated wire is $p = 0.1$ cm. and the diameter of the bare wire is

engineering formula for long thick coils, is 0.06194 henry.

Problem II.—To find the self-inductance of a coil of mean diameter $d = 10$ in. (25.4 cm.), of axial length $b = 2$ in. (5.08 cm.) and of thickness of winding $c = 2$ in. (5.08 cm.). It is wound with 400 turns of square wire with very thin insulation.

By formula (1),

$$L = \frac{2\pi \times 10 \times 160,000}{0.3937 \times 10^9} [2.996(1 + 0.005 + 0.0017) - 0.5 - 1.0472 + 0.005 + 0.00125 + 0.3472 + 0.0052] = 0.04666 \text{ henry.}$$

By formula (2),

$$L = \frac{2\pi \times 10 \times 160,000}{0.3937 \times 10^9} [2.996(1 + 0.005 + 0.0017) - 1.0556 - 0.5 + 0.005 + 0.3472 + 0.0060 + 0.0088] = 0.04666 \text{ henry.}$$

By formula (3), $L = 0.04664$ henry.

National Research Council to Be Permanent

By order of President Wilson, the National Research Council, which was organized in 1916 at his request by the National Academy of Sciences, as a measure of national preparedness, is to be perpetuated. Representatives of the government will, upon the nomination of the academy, be designated by the President as heretofore as members of the council.

Burning Dust-Bearing Coal

Results of Tests to Determine Its Air Admittance, with Conclusions as to How This Fuel Can Be Burned Efficiently—Better Control of Boiler Plant, with Increased Reliability and Flexibleness, Attained

BY L. A. STENGER

CONSIDERATION of the fundamental laws of coal combustion and conditions affecting boiler and furnace performance led the writer to study the air flow through coals. Several interesting observations were made which have a direct bearing on the important question of fuel conservation in this country. Preliminary tests showed that the weight of air passing

graded coals are indicated in Fig. 1. This indicates that air flow was sharply restricted by grain sizes near $\frac{1}{8}$ -in. (3.175 mm.) and increased at very rapid rates as the grains were larger. That part of coal near $\frac{1}{8}$ -in. grain size and less is designated as dust. The extent to which dust in the coal affects the air flow is shown by Fig. 2. This curve represents the average of air-flow tests on different surface wet coals as received ready for firing.

FIG. 1—RATE OF AIR FLOW THROUGH SCREEN-GRADED COALS

through a given coal per unit of time is dependent upon the difference in air pressure through the bed, thickness and area of the bed, state of surface wetness of the coal, and most important, the degree of fineness of the coal particles. These tests were made with a simple apparatus like a gasometer, which would deliver a volume of air at constant pressure through a cup with screened bottom, which contained the coal under test. The time taken to force the known volume of air through the coal was measured with a stop watch. This furnished data to compute unit air flow.

Different coals of various screen gradings, dust contents, conditions of surface wetness, etc., were tested under comparative conditions. Tests comparing surface, dry, dust-bearing coal with the same coal when the surface was wetted throughout the mass showed that the wet coal allowed approximately twice the air flow that the dry coal would. This is due to the fact that the water collects the small grains, holding them together and to the larger pieces, thus preventing their settling and filling the void spaces. After the coal is again dried, if it is not agitated too much, the dust is cemented together loosely by the deposited soluble salts of the coal. The resulting increase of air flow explains the improvement in combustion of wetted coal. It was also proved that layers of dust, placed either at the top, bottom or in an intermediate position in the coal mass, retarded the air flow to a much greater extent than if the dust were distributed uniformly throughout the coal.

The comparative rates of air flow through screen-

RELATION OF AIR ADMITTANCE TO BOILER PERFORMANCE

The relation of air "admittance" of coals to steam-boiler performance is shown in Fig. 3, which gives results obtained from systematic measurements on air flow plotted against data from evaporation tests, with chain grates serving 556 hp. B. & W. boilers. Each of these tests was made with care and attention to details so as to get the best attainable boiler capacity and efficiency. The duration of the tests was from eight to nine hours each. Slack and screenings were used, the largest pieces being not over $1\frac{1}{2}$ -in. (3.81-cm.) in size, usually having wet surfaces as fired and varying in dust content. Some of the tests were made with coal screened approximately dust-free to compare the performance of the coarse fraction with a dust-bearing coal of the same kind. This was done with both Illinois and Youghiogheny screenings. The B.t.u. value of each of the coals as fired was placed on the chart to show its small comparative influence on boiler performance. A dust-free 9900 B.t.u. coal gave much better results than a dust-bearing 12,000 B.t.u. coal.

It should be understood that the figures representing

FIG. 2—RATE OF AIR FLOW THROUGH COALS HAVING DIFFERENT DUST CONTENTS

air flow through cold coal before firing it are no index to the amount of air flowing through the burning fuel bed, but they do show that a coal having limited air admittance cannot be burned efficiently as ordinarily fired and that there is an important relation between that property of fuels and boiler and furnace performance.

Losses in efficiency due to dust in coal are traced to the difficulty in maintaining a free-burning, uniform fuel bed. Holes, ridges or streaks will form. Air passing through holes and areas of burned-out ash causes augmented chimney losses. Areas of coal impermeable to air lie inert, are only coked, not burned, and finally contribute to losses in the ash pit. Boiler capacity is limited, owing to low efficiencies and to reduced rates of combustion.

A study of the data presented herewith and other experiences with dust-bearing coals on different types of stokers, including forced-draft stokers and hand-fired furnaces, shows that it is impossible to attain as good results as may be had from dust-free coals of lesser B.t.u. values. There is not much hope that the operating boiler efficiencies ordinarily obtained in large

FIGS. 3 AND 4—RELATION OF MEASURED AIR FLOW TO BOILER PERFORMANCE

plants can be raised and maintained at any desirable standard if dust-bearing coals are burned with ordinary furnace equipment. To add to the trouble fuel is becoming poorer in all respects and more expensive. Limitation of boiler capacity also contributes to low plant efficiency. This leads to higher costs, both of boiler-house equipment and of operation. Although good types of forced-draft stokers with the ability to increase steam output to 250 or 300 per cent of boiler rating aid much in this regard, their operating efficiency is lowered by dust-bearing fuels.*

*The "operating boiler efficiency" $e = (100 - a) \times b \times c \times 10^{-4}$, where a = the more or less indeterminate losses of the plant, from banking fires, leaks, etc. a varies inversely with the load factor and may be from 5 to 20 in value; b is the operating boiler efficiency, and c is the thermal efficiency of prime movers, including auxiliaries; e is known from $3420 \div \text{B.t.u. per kw.-hr.}$ The operating boiler efficiency will always be less than the average boiler and grate efficiency determined from evaporation tests on the same type of fuels used in the plant, and it depends on conditions of fuel, labor and boiler-plant control.

A plan for permanently raising operating boiler efficiency and the boiler capacity of a steam-power plant follows: Crush all coal, if necessary, so the largest lumps will not be over 1 in. (2.54 cm.) in size. Screen on a mesh chosen to remove all dust of $\frac{1}{8}$ -in. (3.175-mm.) size and less. Dry and pulverize the dust and burn in pulverized coal-burning furnaces serving a part of the present boiler installation. The coarse coal may be burned in the remaining furnaces, in which no changes have been made.

The data in the table give comparative estimates on the plan, based on these assumptions: 9600 B.t.u. and 13 per cent moisture in coal as bought; 25 per cent of the dust is screened from coal (dust having 8600 B.t.u. and 15 per cent moisture or 10,000 B.t.u. and 1 per cent moisture as fired); 40 cents per ton of dry dust is the approximate cost of screening all coal and drying and pulverizing the dust, or 9 cents per ton of coal bought. These costs are based on present prices of a pulverizing plant of about 75 tons daily output and include all the usual fixed and operating charges. It may be noted that the operating boiler efficiency and some other figures set forth for the suggested plan are weighted averages.

COMPARATIVE DATA ON PLAN DESIGNED TO BRING ABOUT INCREASE OF BOILER EFFICIENCY

	Present Operation	WITH SUGGESTED PLAN		Plant Average
		Coarse Coal	Pulverized Coal	
Operating boiler efficiency (per cent).....	55	72	76	73
Calorific value of coal as fired (B.t.u.).....	9600	9900	10,000	9922
Lb. coal as fired per 1000 lb. water evaporated.....	181			134
Lb. coal as bought per 1000 lb. water evaporated.....				139
Lb. coal as required per 1000 lb. water evaporated (includes coal for drying dust), total.....	184			140
Lb. coal saved.....				44
Coal saved (per cent).....				24
Added cost of coal per ton bought due to treatment.....				\$0.09
Net financial saving (per cent) with coal costing:				
\$1 per ton at plant.....				13.2
\$2 per ton at plant.....				19.7
\$3 per ton at plant.....				21.2
Approximate increase in boiler rating, from 125 to 175 per cent of rating (per cent).....				40.0

It may be seen that the net saving is based upon the possible increase in boiler operating efficiency only. A further saving is possible in plants with the usual load factor of lighting and power plants by bringing about a decrease of the quantity a in the plant efficiency formula given in the footnote. This saving was not estimated on account of the indefiniteness of the figures involved. It would be no inconsiderable economy, owing to less banking of fires, as a smaller number of boilers would have to be fired to carry the peak load than under the conditions previously existing.

With the suggested plan in operation the boiler plant could be better controlled and it would be more flexible and more reliable. There would be much less ash to dispose of. The savings brought about in money, coal and transportation and the inexpensive increase of power capacity as compared with the previous output would be very helpful at any time, and most of all in the immediate future, when the problem of war-time economy looms so large.

Experiment in Insurance Co-operation

More than One Hundred Electric and Gas Companies in New York State Unite to Protect Themselves Against Claims for Accident Compensation—Experience Shows Excellent Results from Plan Adopted

BY CHARLES E. MORRISON, C.E.

General Manager Utilities Mutual Insurance Company

PRIOR to July 1, 1914, when the workmen's compensation act became effective in New York State, the public utility interests, as represented by both the electric and gas industries, conceived the idea of forming some sort of a mutual organization for the purpose of taking care of their needs in respect to compensation insurance, particularly with the thought that by so doing they might practically demonstrate the advantages of co-operation in connection with this detail of their business. This included, naturally, not only the payment of claims for accidents incurred but also its corollary, "accident prevention."

As a result of this thought on the part of the public utility operators, the Utilities Mutual Insurance Company was organized with approximately 100 electric and gas companies constituting its membership.

The scheme was to conduct the operations on a purely businesslike basis, and in effect the organization was, as its name indicates, a truly mutual compensation insurance company, confining its activities, however, exclusively to this form of insurance and to New York public utilities. Numerous advantages were to be derived by thus restricting it to preferred classified risks.

To every member company the same premium was charged that would be charged by a tariff or stock compensation insurance company, and then, after having set up appropriate and adequate reserves for losses that had been incurred through accidents, as well as charging against operations all necessary expense, the undivided surplus was to be distributed among the member companies as a dividend, thus operating to reduce the net cost to the members themselves.

So far as is known, this is one of the first practical demonstrations in the utilities field of companies getting together for the purpose of reducing operating expenses by a mutual or co-operative organization.

There are, of course, many national, state and local scientific, commercial and other bodies in the industry which generally seek to assist one another by the exchange of technical, commercial or other ideas, data and information; but perhaps it remained for the Utilities Mutual to demonstrate conclusively that it was as feasible to pool the interests of the industry for the purpose of securing the financial returns from co-operative action as along other lines.

BUSINESS SUCCESS OF THE UNDERTAKING

As one looks back on the organization as first constituted, it seems as though it were a very foolhardy undertaking for a group of public utility operators to originate an insurance company with practically no knowledge of insurance matters, but it remains to be said nevertheless that these operators, through the application of business methods, have made their undertaking a very profitable one.

In no year has the company returned less than 20 per cent in the form of dividends, and its surplus has

always substantially exceeded this amount. In effect, this means that by the application of business methods to the detail of compensation insurance for public utilities we are able to cut the cost materially below that of the stock or tariff companies. A question naturally arises as to how these results have been accomplished.

CHIEF FACTORS IN SUCCESS

We say, without fear of contradiction, that perhaps the largest contributors to this success are the 100 per cent moral hazard, the mutual interest and the co-operative spirit that naturally exist among public utility operators as a class. This spirit, as a result of the elimination of competition, may unquestionably be more intensively developed among them than in any other single industry, and as a consequence the insurance carrier—which is in effect the member companies themselves—has reaped the benefits in that safety first suggestions have been uniformly and willingly complied with by the operator and accidents correspondingly decreased.

The recommendations offered to our member companies deal primarily with the physical hazards existing in their plants and are the result of the most careful engineering inspections. It is wise to note here, however, that there is a very marked difference between our engineering inspections and those of other companies or organizations. It rests primarily on the fact that we believe more can be accomplished by a sincerity of purpose than by an arbitrary attitude that this or that may be wrong and therefore *must* be corrected. Our engineers are known personally to the staff of each member company as responsible, painstaking men, and they always get a cordial reception when they undertake an inspection. It is because they get close to the operatives that an interest is created in their work and their recommendations and that, as a sequence, the reduction in the number of accidents has taken place.

We endeavor to make at least two examinations of each company's property in each year—the same engineer never making two successive inspections. This enables us to place a check on the observation powers of each inspector and to create a friendly rivalry among them. As soon as these inspections are made the home office is advised, and a communication with a report is sent to the manager of the member company requesting him to inform the home office as to what action will be taken with respect to these recommendations. Invariably the reply is that they will be complied with immediately or as soon as the material and labor can be supplied for the purpose.

While these recommendations deal largely with the removal of physical hazards or defects and the installation of safety devices, they act also as a stimulus to further effort on the part of the employees and

the management. They also apply to housekeeping conditions the morale and esprit de corps of the employees. Careful supervision is kept of these recommendations through a follow-up system, to see that eventually all are complied with.

The inspections are quite frequently followed by safety first talks and committee meetings, together with illustrated moving pictures on standard safety first practice. We endeavor to see that all of our member companies are supplied with the invaluable bulletins of the National Safety Council, as these always have some vital message to tell.

Accident statistics are kept of each member company, so that at any time it is possible to develop each company's experience for the purpose of correcting unsafe practices. This develops a comparison of each mem-

demonstrated beyond question by the record of fatalities which in the electric industry contribute most largely to the losses. The following will serve for an example: Among approximately 5000 employees with an annual payroll of about \$5,000,000 the six months ended June 30, 1917, contributed just one fatal accident.

Even in this case it is questionable if the accident was a result of operating conditions, as it is felt, and we believe proved, that the employee died from natural causes. This one fatality compares with six fatal accidents occurring in the preceding six months. While it is appreciated that there may be a considerable element of chance or luck in this, there are good grounds for believing that the more intensive inspection service in the later period contributed very largely to this reduction of fatal accidents.

ACCIDENT REDUCTION AS A BUSINESS PROPOSITION

One particular reason why our member companies are so willing to co-operate for the protection of their employees—aside from the purely humanitarian one—is that they can readily see how their personal interests are being served by the reduction of accidents at their respective plants. Every life that is saved, every accident that is prevented, means so much less in the cost to the company as a whole, and therefore so much more surplus to be divided among the individual member companies in proportion to the premiums that they pay.

On a purely dollars-and-cents basis this co-operative spirit has returned to the public utilities of the State in the past three years a sum in excess of \$100,000. Such an amount is not to be belittled in these times of increasing production costs, and we know of no other department in public utility operations that compares with this return.

There is submitted with this article a curve which indicates what may be expected to happen when the safety first and accident prevention problems are attacked in a consistent and intelligent manner.

This curve represents the experience of a public utility company in the State of New York. It will be noticed that to the left of the peak the compensation costs, medical costs and days lost, which latter do not include fatalities, are very irregular and excessive. The peak represents several serious accidents, and at this time it was deemed advisable to secure the services of a safety engineer. A glance at the curve to the right of the peak will show how the compensation costs, medical costs and days lost have consistently fallen.

Perhaps immediately after the several serious accidents was the strategic time to prepare intensively against similar occurrences, and perhaps also eighteen months may not legitimately be considered as conclusive evidence of accident experience. However this may be, nevertheless we do know from the curve that less money has been spent for compensation, less money has been spent for medical attention, and fewer days of lost time have been recorded, since the installation of the safety engineer than before it. No further evidence, it is believed, is necessary to indicate the vital need of attention to careful and safe practices among employees nor to prove how enormously it may contribute to accident reduction.

HOW A UTILITY COMPANY'S ACCIDENT COSTS DECREASED WITH APPOINTMENT OF A SAFETY ENGINEER

ber company's experience with that of the average of all, and if the experience of the individual is less satisfactory than that of the group as a whole, there is immediately created an incentive on the part of the operator or general manager to better this record in order to present as clean a slate as that of others to whom he is personally known. Should an abnormal record develop with respect to any one particular company, a conference is arranged with the general manager for the purpose of discussing in detail his safety first work or lack of safety first work.

Frequently an inspector will be assigned for an intensive investigation of two or three weeks to one of these member companies for the purpose of studying the underlying spirit of the organization and to determine whether there is not some element or factor which is tending to cause carelessness on the part of employees and therefore to promote accidents. Sometimes also the safety engineer of one organization will be loaned to another in the interests of "safety first."

That these inspections have produced results is

Economic Aspects of Summer Load—I

Features of a Class of Service Which, When Properly Handled, Yields Profitable Revenue and Exerts Great Influence in the Popularization of Electricity—How Power Business Grows in the Hot-Weather Term

THE economic value of summer service by central stations is of widespread interest to managers of companies whose systems are within commercial reach of vacation resorts. A comparatively high rate per kilowatt-hour is often applied to this class of service

FIG. 1—NEWPORT "COTTAGE"; SUMMER REVENUE TO CENTRAL STATION FROM THIS MANSION HAS EXCEEDED \$600 A MONTH

on account of the few months during which it is in demand and the resulting relatively large overhead charges associated with the distribution of energy to customers of transient or semi-permanent character.

It is doubtful if any general statement can be made that summer service is unfailingly profitable to central stations, so much depends upon the intelligence with which it is provided and maintained. In a recent study of summer service among central stations made by a representative of the ELECTRICAL WORLD, it was found that very few analyses have been made by managers of the investment and operating costs of this class of busi-

FIG. 2—SUMMER HOMES AT REVERE BEACH, MASS.; WITH THESE HOMES INVESTMENT MUST BE KEPT AT MINIMUM

ness. Data as to revenue are much more accessible. The entrance of the United States into the war has left central-station managers little time in many cases in which to analyze the summer load, and the policy of extreme conservatism regarding extensions has held back development on many properties. None the less, from

an extended survey of the summer-load field, it appears clear that if this business is to be handled profitably, certain points must be considered, and in the following paragraphs some of these will be discussed.

An extraordinary range of revenue yield is found in summer service. The multi-millionaire's "cottage" at Newport, R. I. (Fig. 1), has yielded over \$600 per month to the local central station in the height of the summer entertaining season. The humble cabin at Revere Beach, Mass. (Fig. 2), brings the lighting company perhaps \$4 to \$5 for the entire season from May to Labor Day. Between such limits as these are returns of the most varied character, and the "acid test" of profit or loss depends for its outcome upon service cost in its broadest aspects, including a careful control by the central station of the investment required.

Where a large seasonal revenue is obtained it naturally follows that a much greater outlay for distributing lines can be carried successfully than where

FIG. 3—LOAD CURVE OF COMPANY SERVING REVERE BEACH ON THE DAY OF MAXIMUM SUMMER PEAK

the income yield of a customer is nominal. Fine establishments such as one sees at Newport, Bar Harbor, York Harbor, Me., and other high-class vacation resorts justify underground service entrances almost invariably. Customers occupying these costly estates often insist on the absence of all pole-line construction in the immediate vicinity of their residences.

On the other hand, the types of summer homes shown in Fig. 2 must be served at rock-bottom investment cost, and in the case shown in the photograph this has been accomplished by carrying the secondary mains past the cottages and feeding the latter in pairs off two-wire drops. The individual cottage leads are connected with the drop lead by ordinary overhead soldered joints, without extra insulating equipment or structural installation beyond the house attachments. The service is carried downward from the outside insulators to the entrance near the meter location by a short vertical run of iron conduit. Shacks of the kind illustrated are extremely

poor fire risks, and first-class wiring within and close to the building is essential. The actual cost of a service in such cases probably does not exceed \$4 or \$5. In the case of the Revere company, the customers occupying these little establishments pay the cost of wiring from the pole to the house, including secondary leads serving a group of houses. The company provides all primary

FIGS. 4, 5 AND 6—PENNY SCALE AND SAUSAGE STAND GET CENTRAL-STATION SERVICE; PART OF AMUSEMENT BOULEVARD IS SHOWN IN UPPER RIGHT-HAND PICTURE

wiring, the transformer for the cottage group and the individual meters. The tenants usually return year after year.

THE SUMMER-SEASON PEAK LOAD

Both at Newport and Revere, and in many other instances where a vacation load forms a great part of the service, the annual peak comes in the summer season. Fig. 3 shows the load curve of the Revere company on the day of maximum peak, which occurred July 29. In the *ELECTRICAL WORLD* of Sept. 1, 1917, page 422, an analysis was printed of the economic advantages of interconnection between the plants of the Salem Electric Lighting Company, the Malden Electric Company and the Suburban Gas & Electric Company of Revere. The fact that the Revere company's peak load occurs in summer, and in the form shown in Fig. 3, is significant in the foregoing connection, since the Salem and Malden peaks occur in the winter. The Revere peak can thus be handled in part by the reserve equipment available at Salem in the summer evenings, and the generating machinery in the Revere station need be used only on the peak or whenever additional energy is temporarily required at Salem. The tie line between the three systems, all managed by Charles H. Tenney & Company, of Boston, enables the advantages of the summer peak load at Revere to be reaped to the full, and the service is handled with minimum investment and operating cost.

Summer service at Revere Beach typifies this class of business at many other highly popular resorts on the Atlantic coast. This beach is within a 5-cent-fare distance of both Boston and Lynn. In the heated season sometimes 200,000 persons visit Revere on a single Sunday or holiday, and the patronage on a week-day evening or afternoon is always heavy in good weather. A view on the Revere Beach boulevard is shown in Fig. 4, this stretch of waterfront devoted to amusement being about a mile long and occupied by the most varied concessions.

The boulevard is illuminated by a great variety of sign and outline lighting, and in addition by about 2100 8-cp. lamps mounted in groups of fifty on wooden frame arches spanning the roadway. Service is rendered from dusk to 11 p. m. between May 30 and Labor Day, inclusive, the concessionnaires along the beach meeting the service cost. About \$1,500 per year is derived by the company from this service.

Instances of the energy consumption of various types of concessions are interesting. A large bathing establishment used energy for lighting as follows: From May to September, inclusive, 850, 1554, 1697, 2366 and 1629 kw.-hr., or a total of 8096 kw.-hr. for the season, at 10 cents per kilowatt-hour. A dance hall consumed 9914 kw.-hr. in the season, at 10 cents, and a large coaster purchased 9800 kw.-hr., the monthly consumption at 10 cents per kilowatt-hour being 724 (May), 1889, 2473, 3527 and 1193 kw.-hr. A theater and dance hall with a 35-hp. motor consumed, including lighting, 27,730 kw.-hr., yielding the central station \$1,886 from June to September inclusive, and a merry-go-round consumed 25,372 kw.-hr. from May to September inclusive, at a cost of \$1,768. A coaster establishment used 44,586 kw.-hr. during this period, paying the central station \$2,729. This last place was equipped with five 400-watt floodlamps, a 40 hp. motor for hauling three 1-ton, ten-passenger cars to the top of the incline of the scenic railway, a 0.5-hp. organ motor, seven 500-watt bracket lamps and a 1-hp. motor driving a deep-well pump which is used to supply water to a lagoon through which the patrons pass. Another amusement palace and dance hall, equipped with 33 hp. in motors driving mirth-provoking devices, consumed 51,365 kw.-hr. during the season, at a cost of \$3,068, including lighting service. The lighting and power service of another coaster totaled 32,230 kw.-hr. (100 hp. connected load), at a cost of \$2,111 to the concessionaire. Another merry-go-round yielded the central station \$1,126 on 12,519 kw.-hr. (25.5 hp. in motors on the place); another scenic railway, with 75 hp. installed, consumed 37,380 kw.-hr., at \$2,369, from May to September, inclusive, and another coaster consumed, with its lighting, 10,295 kw.-hr., bringing a revenue of \$1,014 to the Revere company.

FIG. 7—SEVERAL LARGE COTTAGES AT YORK HARBOR, ME., ARE SUPPLIED FROM A SINGLE TRANSFORMER

Besides these large customers, there are many small establishments at this beach. It is, of course, necessary to maintain a minimum seasonal charge in all these installations of small size. The net lighting rate of the Revere company, which also serves a large all-the-year residential and business population in the territory oc-

cupied by it, is 10 cents per kilowatt-hour, with a minimum charge of \$1 per month for each installation. In case the service is not used at least five months, so as to afford the company \$5 net income for its use at the regular rates, the customer is required to pay to the company an additional amount sufficient to make this income \$5, the additional amount, however, not being

FIG. 8—OUTDOOR SUBSTATION SERVING CENTRAL-STATION SUMMER CUSTOMERS AT YORK HARBOR, ME.

allowed to exceed \$2 per meter. There are no free lamp renewals on this schedule.

Examples of small lighting customers on summer service are shown in Figs. 4 and 6. The latter illustrates a frankfurter stand equipped with five 50-watt lamps, and the former a penny scale equipped with fifteen 10-watt lamps. These little installations are long-hour users of energy. On the Revere system it is customary in summer to read all meters weekly and make weekly collections of bills. The collector reads the meters.

Large customers at Revere Beach receive the benefit of a lower rate in case during any four consecutive months the customer uses more than 10,000 kw.-hr. of energy. The first 10,000 units are billed at 10 cents net, and the excess at 5 cents per kilowatt-hour.

The illuminating department of the Bay State Street Railway at Newport, R. I., has about 300 summer customers. On July 1, 1916, the company established a so-called short-term rate for residences as follows: Customers using light during the months of May, June, July, August, September and October pay only 21.5 cents per kilowatt-hour, with a 10 per cent discount on bills paid on or before the tenth of the months in which they are rendered; minimum charge, \$2.22 per month. Customers having service connected for more than fifteen days during any one month are billed at the minimum charge rate for a full month. Some of the largest residences in the Newport summer colony have consumed 1200 kw.-hr. or 1300 kw.-hr. in a single month. The lighting of garages, laundries, kitchens, gardeners' quarters and lodges is considerable, and when the season is gay elaborate electrical illuminations are used in connection with lawn parties.

The yearly lighting rate at Newport for consumptions up to 100 kw.-hr. monthly is 11.25 cents net, and the power rate is 10 cents net for the first 200 kw.-hr., with a minimum charge of \$2.50 per month in business places. Some of the larger residences purchase energy on power rates for the operation of elevator motors and other machinery. There is no special power rate for summer service. There is also a large summer electric railway traffic.

Besides the large residences supplied, in practically every case by underground services, in the celebrated Bellevue Avenue district, the company operates in an extensive suburban zone, having many customers on its lines during the summer who use smaller amounts of energy, say \$5 or \$10 worth per month. Bills are rendered monthly to all customers. As a rule deposits are not required. Some of the large customers pay for their service at the end of the season, preferring not to remit checks month by month, but in general the bills are settled monthly.

On the Maine coast electrical appliances are exceedingly popular in some of the higher class resorts, notably at York Harbor. The York County Power Company serves this district.

The York company's system includes 165 miles (265 km.) of primary lines, 70 miles (112 km.) of highway lighting circuits with summer peak load of about 1000 kw. and a winter load of 400 kw. There are a considerable number of summer hotels served by the company, yielding from \$1 to \$10 per day in revenue. In round numbers, the cottages yield from \$2 to \$75 per month from electric service. The company prefers to keep the cost of all line extensions within \$100. The summer business brings in more revenue in one month than the rest of the service produces in a year. The first 100 kw.-hr. are billed at 20 cents per kilowatt-hour on the seasonal rate, all energy in excess being billed at 10 cents. There is a minimum charge of \$2 per month of occupancy. The yearly lighting rate is 9.25 cents. A seasonal power rate is in use, beginning at 12 cents per kilowatt-hour for the first 200 kw.-hr., with reduction to 6 cents per kilowatt-hour for all energy in excess of 600 kw.-hr. per month. A minimum charge is made of \$2 per month for installations of less than 2 hp. and \$1 per horsepower per month for installations of more than 2 hp.

In supplying summer homes the joint use of poles by the central station and the telephone company saves on the investment, and the practice of running grouped house services from a centrally located transformer (Fig. 7) minimizes the outlay for overhead construc-

FIG. 9—ONE OF THE PIERS AT OLD ORCHARD BEACH WHICH AFFORD A LARGE LOAD IN THE SUMMER MONTHS

tion. A summer hotel in this district accommodating about seventy-five patrons, with twelve 25-watt lamps in its dining room, open thirteen weeks, pays about \$1 per day for electric service. One 25-watt lamp per room meets the requirements well.

Hydroelectric energy is distributed through much of the Maine coastal district, and outdoor substations

serving many summer cottagers are illustrated in Fig. 8. These installations are built as inexpensively as is consistent with safe and reliable service. A few thousand dollars will provide an outdoor substation capable of meeting the electrical wants of summer communities extending over from 10 miles to 20 miles (16 km. to 32 km.) of coastline, even under present price conditions. Every house has a separate service if on the company's lines. The cottage meters are removed whenever a place is vacated, even if another tenant moves in within two hours. Meters in business establishments, amusement places, etc., are read Mondays, collections being made Wednesdays. If payment is not made by the end of the week, the service is cut off.

Long-hour lighting service is often a feature of summer resort work, the revenue being dependent upon the extent of amusement concessions offered. At Newport the Casino yields about \$100 a month in lighting revenue alone. Piers like the one at Old Orchard shown in Fig. 9 are open many evening hours each week and often contain moving-picture establishments and other attractions using much electrical energy. At Old Orchard there is a scheme of decorative street lighting by stringers of 10-watt lamps from July 1 to Sept. 1, about 1500 lamps being in service. These, with seventeen 750-watt lamps, wired in multiple for beach service, yield a revenue to the central station of about \$1,225 per year. The town pays for this and also meets the cost of the electric sign shown.

The experience of a central station in Massachusetts suggests the importance of more thorough analyses of cost in extending lines to summer camps. A line was built at a total service cost, including two transformers and meters for nine cottages, of about \$1,000. The cottages were on an island about one-quarter of a mile (0.4 km.) long and with its nearest point about 200 ft. from the mainland. No. 6 copper was run along the island, with 30-ft. (9-m.) chestnut poles and single-phase, 2300-volt service. Although four pumps motor-driven and of 5 kw. combined rating were in service for water supply, the total revenue for a season was only about \$85. The total connected load was under 10 kw., and two overhead stranded steel guy wires connected the island circuit with the mainland. The company feels that the volume of business is too small to justify the service, which includes the occasional expense of sending a troubleman more than three miles from the generating plant to the island. There is a very small use of energy despite the maintenance of a net rate of 10.8 cents per kilowatt-hour. It was felt that had the cottagers borne the cost of the extension and been charged a summer rate of 15 cents per kilowatt-hour the business might have been profitable.

A rate of 25 cents per kilowatt-hour has been successfully used for some years by the Manchester (Mass.) Electric Company in handling seasonal business with exclusive underground service among Boston North Shore cottagers. Where the density of service is high or the volume of business large much lower rates are of course justified.

In a future issue of the ELECTRICAL WORLD further information on the economic aspects of summer service will be given in the concluding part of this article, which will contain comparisons of revenue earned by central stations from month to month, with their changing peak loads and output variations.

Book Reviews

FINDING AND STOPPING WASTE IN MODERN BOILER ROOMS. By engineers of the Harrison Safety Boiler Works, Philadelphia, Pa. 276 pages, 213 illustrations. Price, \$1.

The saving of coal is the purpose of this practical handbook, which is addressed to power-plant owners, managers, engineers and firemen. The preface states that such statements, tables, charts, etc., have been selected as were supported by experiments and tests, references being given wherever possible to the original authorities. The latter include many well-known engineers and writers in technical periodicals, also authors of papers before engineering societies, while the excellent bulletins on the utilization of fuel issued during recent years by the United States Bureau of Mines have been freely drawn upon. Pains have been taken to compare statements and to check each source of information against others. The work is divided into five sections, dealing with fuels, combustion, heat absorption, boiler efficiency and testing and boiler-plant proportioning and management. The book is well worth being in any engineer's reference file or library.

ENGINEERING MATHEMATICS. A Series of Lectures Delivered at Union College. By Charles Proteus Steinmetz. New York: McGraw-Hill Book Company, Inc. 320 pages, 110 illustrations. Price, \$3.

This is the third and enlarged edition of a particularly interesting textbook on mathematics as commonly required by engineers in general but particularly by electrical engineers. The subject is treated with much freedom and originality. The book is divided into seven chapters, dealing with the following respective topics: The general number, the potential series, trigonometric series, maxima and minima, methods of approximation, empirical curves, and numerical calculations. There are also appended notes on function theory. Considerable skill is shown in presenting practical engineering problems illustrating the use of the mathematical processes described. The author also deserves praise for having altered the text of the first edition in order to conform to international convention concerning vector phase representation. The book will be of value to electrical engineering students and of interest to all who come in contact with applied mathematics.

Books Received

CLEARING THE GROUND. By "Lumber-Man." London: Constable & Company, Ltd. 312 pages.

MANAGING A BUSINESS IN WAR TIME. Chicago, New York and London: A. W. Shaw Company. Two volumes, 424 pages, illustrated. Price, \$3.

ELECTRICITY METERS, THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gherardi. London: Benn Brothers, Ltd. 504 pages, 406 illustrations. Price, 15s.

ELEMENTS OF FUEL-OIL AND STEAM ENGINEERING. A Practical Treatise Dealing with Fuel Oil, for the Central-Station Man, the Power-Plant Operator, the Mechanical Engineer and the Student. By Robert Sadler and Charles H. Delany. San Francisco: Technical Publishing Company. 320 pages, illustrated. Price, \$3.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

GAGES USED FOR TESTING

WOOD PINS AND PINHOLES

Allowances Are Made for Over-Size and Under-Size Dimensions—Careless Workmanship Will Not Be Accepted and Waste Will Be Minimized

When wood pins are used to support insulators, the shanks should be of such a size that a reasonably close fit in the cross-arm will be obtained. An over-size shank may split an arm, while one too small will make the pin loose, weak and liable to decay. Obviously, pins made of such a rough material as wood cannot be procured of exact and uniform dimensions, so reasonable allowances must be made in purchasing.

The specifications of one company provide that the standard N. E. L. A. dimensions may be exceeded by not more than 2 64 in. (0.8 mm.) at the butt and by not more than 1 64 in. (0.4 mm.) under the shoulder. In

CONVENIENT GAGE FOR TESTING WOODEN PINS

order to simplify the testing of pins ordered under this specification, an iron gage with a 1 1/2-in. (3.8-cm.) opening was made. By inserting the shanks in this gage pins may be tested with considerable rapidity. If the pin goes in as far as the shoulder and fits loosely, it is rejected as being under size; on the other hand, a pin which will not go in so that the shoulder is within 3/4 in. (1.9 cm.) of the gage surface is considered too large and is also rejected.

Cross-arm dimensional specifications must likewise be of a practicable kind so that they will neither cause the rejection of adequate material nor permit the acceptance of pieces which represent careless workmanship. This company covers this point by the following specification: "Cross-section dimensions of cross-arms must not vary more than 1/8 in. (3.2 mm.) above or below the dimensions shown in blue prints. Holes must not be more than 1/4 in. (6.4 mm.) off center longitudinally, or more than 1/8 in. (3.2 mm.) out of line." In checking pin-hole dimensions the gage shown is useful.

ISOLATING THE NEUTRAL

OF TRANSFORMER BANKS

Tests of Change from Delta to Star Operation Show Why Insulation of Neutral of Three-Phase Star-Connected Transformers Is Important

When three transformers are used on a four-wire circuit the neutral point of the transformer bank should be isolated except in special cases, says George Wagner, superintendent of distribution of the Madison (Wis.) Gas & Electric Company. That is, it should have no connection with the neutral wire of the circuit or the ground. Some companies have tried to connect the primary neutral points of transformer banks which supply comparatively large single-phase loads in addition to three-phase loads. To take care of the unbalanced load they have installed a larger transformer in the phase supplying the single-phase load. The primary neutral wire was connected with the idea that it would carry the excess primary current for the larger transformer so as to divert it from the windings of the smaller transformers.

Some laboratory tests recently made by the Madison company brought out the fact that under the conditions cited the primary neutral carried practically no current. The tests indicated that if a single-phase load is supplied from one phase of a three-phase bank of transformers the other two transformers act as one single-phase transformer operating in parallel with the transformer on the loaded phase and share the load with it. The oscillograph records showed that the current through the primary winding of the large transformer divided and part of it passed through the primary of each of the other two transformers. The current waves of the two transformers were about the same, exactly in phase and just 180 electrical degrees from the current in the transformer on the loaded phase. The tests also showed that the current in the neutral wire is practically zero so long as the voltages are balanced. As soon as the voltages are unbalanced in the secondary delta a circulating current is set up in the delta and there is a flow of current in the neutral wire of the primary circuit.

When a single-phase load is supplied from one phase of delta-connected secondaries the load is distributed over the three transformers, the transformer on that phase supplying about one-half and the other two together the other half. The exact proportions of the load supplied by each seem to depend upon the power factor of the circuit. The three transformers divide the single-phase load in about the same proportion whether the primary neutral is connected or isolated.

The results of these tests were verified in the field by testing a bank of transformers supplying a 200-amp., three-phase load and two 100-amp. spot welders connected with only one phase. Every time a spot welder was operated current was drawn from all three transformers, the current in the neutral being practically

nothing. When the voltage on one phase was varied with the feeder regulator, however, a comparatively heavy current was set up in the neutral wire.

It follows, therefore, says Mr. Wagner, that there is no occasion for making one transformer of a bank larger than the other two combined to supply three-phase power and an additional single-phase load. Inasmuch as the neutral wire carries practically no current there would be no excess current under any circumstances in the windings of one or both of the smaller transformers if the larger transformer carried full load. In determining the sizes of transformers necessary for an installation like this it should be borne in mind that the transformer on the phase carrying the single load actually supplies only about one-half of the single-phase current; the other two supply the rest.

The tests also indicate clearly that the primary neutral points of three-phase transformer banks should be isolated unless the transformers have ample capacity to take care of their regular load plus any circulating current that may be set up on account of an unbalanced voltage condition. If one phase wire should become grounded the voltage of that phase would drop on account of the heavy current, but a transformer bank with a primary neutral connected thereto would immediately tend to equalize the voltages on the three phases. The two transformers on the ungrounded phase would draw a heavy current trying to boost the voltage on the grounded phase. The probable result would be that the primary fuse on one transformer would blow and the other two would then carry the load on open delta. If the capacity of these two transformers was insufficient, they would be overloaded and would be liable to damage.

If the primary neutral point of the transformer bank is isolated, no circulating current can be caused by unbalanced voltages, but if the fuses of one transformer rupture, the other two transformers are actually in series between two-phase wires and their secondary voltages are 0.865 normal, or about 200 instead of 220. Furthermore, the voltage across the secondary and the primary of the transformer with the fuse blown is zero when the load is straight resistance or single-phase load. If there are any three-phase motors on the circuit, they may continue running and they will tend to maintain a delta voltage. If the motors are stopped, they will, as a rule, not start, because it would be equivalent to trying to start them on single-phase energy.

CAUSE OF METERS HUMMING AND THE REMEDY FOR IT

Trouble Usually Found Due to Location of Meter and Inattention to Internal Condition

BY GEORGE M. HEWITT

A humming meter makes an annoying noise that usually causes the customer to think that it is operating even though he has no lamps burning. Unless the meter is mounted upon a solid support, the small vibration will be amplified. Therefore, meters should not be placed upon hollow walls or thin partitions which may act as sounding boards or amplifying mediums. The meter tester can often help to reduce the noise by putting rubber washers back of the meter.

The humming of meters may be due to internal causes, for instance, loose laminations and improper assembling of operating elements, or it may be due to defects in the meter. Noise in Westinghouse meters may be caused by defective ball bearings or by the top bearing pin becoming rusted or by clogging due to dirt and dried oil in the first and second register wheels. With the General Electric meters the noise may be caused by defective top bearings, a flat jewel, a weak jewel spring or a loose light-load compensator. Other makes of meters may hum because of gummed-up top bearings, loose parts or flat jewels.

HOW A MINING COMPANY USES CABLE POTHEADS

Disconnecting Feature Employed to Save Installation of Reversing Controllers and Time in Making Emergency Connections

Two interesting and economical uses of disconnecting potheads have been worked out by N. L. Allen, electrical engineer for the American Zinc Company of Tennessee. Sometimes, in connection with the operation of its concentrator, it is necessary to reverse certain motors when the belts are thrown off for repairs.

SCHEMATIC DIAGRAM SHOWING ARRANGEMENT OF POTHEADS

Since it is not necessary to do this very often, three G. & W. Electric Specialty Company disconnecting potheads have been installed at each motor in the three-phase leads to permit reversing the leads quickly and to avoid the necessity of reversing controllers. Of course, where the reversing of motors is more frequently necessary reversing controllers are provided. Another use of potheads is in the leads from the surface feeder to the feeder bus in the mine. The feeders on the surface, which operate at 2300 volts, three-phase, 60 cycles, are connected by means of disconnecting potheads at the pole to steel-armored, lead-covered, paper-insulated cable containing three No. 4 copper wires. These cables go down into the mine a distance of about 500 ft. (152.4 m.) to the feeder bus. A spare cable is provided for emergencies. Both of these cables are "phased out" and marked so that the potheads at both ends can be quickly and properly changed in case of damage to the operating cable.

LOCATING THE CAUSE OF VOLTAGE VARIATION

Consumers' Complaint of Flickering of Lights Leads to Extensive Investigation of Distribution System for Trouble

BY J. J. REZAB

On receiving complaints from several consumers, a central station in the Middle West discovered that an entire section of the system was affected by periodic variation in line voltage. Recording voltmeters placed in secondary circuits showed that in some instances a

SUPERIMPOSING TWO CIRCUITS CAUSES VOLTAGE TROUBLE

variation of as much as 6 volts occurred during peak hours with a frequency of 17 cycles a minute. The distribution system was fed from a substation that received its energy supply from two sources. The system consisted of three-phase, four-wire circuits with grounded neutrals and was about four miles (6.4 km.) long.

A hasty examination of the line and a review of all the power banks showed everything normal. The regulators were checked for hunting, and the compensators were tested for loose connections. It happened that a frequency changer was running idle on the line as a synchronous condenser, so a small load was placed upon the disconnected side in the hope of steadying the line; but this proved ineffectual. The primary circuits were interchanged and the neutral wire of a parallel circuit was tied to the main neutral without helping the condition of the line.

By means of a split-core current transformer the current on the neutral of one branch of the line showed a variation of from zero to 40 amp. at a periodicity of 17 per minute. The current in the phases showed no variation and the voltage did not fluctuate. Another interesting feature was that while the current in the neutral of the feeder current showed little variation, the voltage was subject to 6-volt swings. The tests at last unearthed the cause of the trouble. A single-phase circuit had been installed in the same section with a three-phase circuit, and to economize on wire only one conductor was strung for the circuit, the neutral of the three-phase system being used as the return circuit. Ordinarily this arrangement would have been suitable, but the two circuits were connected to independent sources of energy that were not in synchronism. As a

result two currents occurred in the neutral wire, one moment in opposition, causing zero current, and the next moment in the same direction, causing high current.

METHOD THAT REDUCES THE COST OF SOLDERING

Utilization of an Acetylene-Gas Supply Connected to a High-Pressure Rubber Hose Permits Access to Out-of-the-Way Locations

The cost of soldering lugs on cables, leads to armature windings, etc., has been reduced as much as 60 per cent by the Iowa Railway & Light Company of Cedar Rapids by using an acetylene-gas torch for this work instead of molten metal or soldering irons. The gas is purchased in tanks and is conducted to the burner used for melting the solder by means of high-pressure rubber hose. This method permits workmen to reach locations easily which would be almost inaccessible with soldering irons, and thus the labor cost involved in the soldering process is reduced to the minimum.

WOODEN TOWER FOR A LONG-SPAN CROSSING

Necessitated Because a Steel Tower Could Not Be Secured Promptly to Serve Army Camp

To supply Camp Pike with service promptly the Little Rock Railway & Electric Company had to erect a 13,000-volt transmission line within a very short period. Since the camp was on the opposite side of the Arkansas River from the company's generating station, a 2000-ft.

(606-m.) span had to be provided to cross the river. One bank of the river was about 160 ft. (48.7 m.) higher than the other, so that a relatively tall tower was required on the lower side. Not being able to secure steel towers on short notice, the company erected the wooden one shown in the illustration.

CEDAR TOWER SERVING CAMP

The tower was constructed of four 75-ft. (23-m.) red-cedar poles securely embedded in concrete and cross-braced with 6-in. (15.2-cm.) diagonals. Cross-arms, 4 in. by 6 in. (10 cm. by 15.2 cm.), were used. The total cost of the tower, which was completed in the required time, was less than one-tenth that of the steel tower of the same strength. Of course, the wooden structure will not have so long a life as a steel one would have had, but it is adequate for the purpose, as service will have to be supplied only temporarily.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

STANDARDIZING THE 50-WATT TUNGSTEN IN NEW ORLEANS

Practically No Difficulty Is Encountered in Changing from 25-Watt and 40-Watt Lamps to One of Larger Size

Within two weeks from date of delivery an initial order of 1000 50-watt tungsten lamps was entirely sold out by the New Orleans Railway & Light Company as a result of a campaign to educate the public to the value of this larger-sized lamp. It was felt that there were a great many 25-watt and 40-watt lamps in use which could be changed over to a new 50-watt lamp with better satisfaction to the consumer, and the effort was made to try to standardize the 50-watt size for household use.

As the new lamp is sold at the same price as the smaller lamp, practically no difficulty was encountered. It appeared to the public to be a chance to take a larger lamp at the same price. Further shipments of these lamps are on order and will be received at regular intervals during the rest of the year, and the campaign will be continued from time to time until this lamp is in general use.

UTILITY AND PUBLIC RECIPROCAL RELATIONS

Member of Oklahoma Commission Believes that the War Will Show How to Co-operate to Build Up Community

In a paper devoted to public relations, read before the Oklahoma Gas, Electric and Street Railway Association, A. L. Mitchell of the Corporation Commission of Oklahoma laid emphasis on the reciprocal relations that exist between the utility on the one hand and the public on the other. He closed the paper in the following words:

The most valuable asset that any public utility can have is the favor of the public that it serves. The truth of this statement is realized by most utilities at this time. Some are more successful than others in applying their realization of this fact in practice. One of the compensations in the war emergency is that the American people are forgetting supposed differences among themselves in their unanimous hostility toward the nation's enemy. With the public utilities and the public making every effort to be useful in the winning of the war, neither has time to waste in magnifying the importance of a grievance toward the other. It is likely that both will learn that if they can work best by co-ordinating their efforts toward the putting down of a common enemy, they can likewise work best by co-ordinating their efforts in the building up of the community in which they both live and in whose best success both can expect to share.

In any growing community it is necessary for all interests to experience some of the inconveniences of the pioneer. If there ever was a time when all interests and all individuals should stand shoulder to shoulder for the common betterment of mankind, it is in the present time of national emer-

gency. When the storm is over and the clouds have lifted we expect to see the fruits of unity of purpose for the betterment of mankind. If the same spirit can be perpetuated for the betterment of the community in which each individual and each utility lives, most of the trouble due to misunderstanding of the relationship between the public and the utility will have been overcome.

INTERESTING PROVISIONS OF ARSENAL SERVICE CONTRACT

Government to Pay for Extension, with Stipulations for Company to Take It Over Later as Conditioned by Revenue Received

There has recently been executed between the Edison Electric Illuminating Company of Boston, Mass., and the Watertown arsenal a contract for the supply of electric energy by the former to the latter which contains several provisions of interest to central stations in the way of furnishing service to the government at this time. About seventy new buildings are under construction at Watertown as a part of the war program, and last summer a contract was entered into between the parties named above for the supply of electrical energy based on a line capacity of not over 250 kva. at any moment. The additions to the Watertown establishment require a line capacity of 20,000 kva. at any one moment and 14,000 kva. continuously, the supply of which necessitates the installation of four underground transmission lines, each consisting of a three-conductor 4/0 13,200-volt cable, or three transmission lines in addition to that required by the contract of last summer. These lines connect the arsenal with the L Street station of the company and are to be used solely for furnishing electric energy to the arsenal, except by prior written authority of the contracting army officer. The service includes the operation of motors, electric furnaces, lamps, etc. The arsenal is about 6 miles (9.6 km.) from the L Street station.

FOUR LINES FOUND NECESSARY

Last fall it was orally agreed that three lines would be provided, but it was soon found that a fourth line would be required. On Nov. 1, 1917, the company increased its power rates by the incorporation of a coal clause, and it had previously agreed with the arsenal that the energy billed over the two additional lines should be supplied at the rate agreed upon for the first line. As the cost of the service to the arsenal would be less if the running cost of the schedule of prices were applied to a single contract than if it were applied to more than one contract, it was decided to be in the best interests of the United States to amend the contract of last summer so that the schedule of rates agreed to then would apply to all electrical energy furnished by the company to the arsenal.

The supplementary agreement provides that all of the

lines are to be installed by the company at its own expense and in locations obtained by it, except that it is to be indemnified by the United States for part of the expense of installing the fourth line. As the line capacity of 2500 kva. at any moment provided for in the contract of last summer has been increased by the supplemental contract to a capacity of 5000 kva. at any moment, the minimum yearly payment per line has been raised from \$25,000 to \$50,000, making a total minimum charge per year, when all four lines are connected to the arsenal, of \$200,000; but the arsenal is not required to pay the minimum annual rate provided for the fourth line, viz., \$50,000 per year, unless and until the company shall have repaid to the United States the latter's investment in the fourth line as follows:

The United States agrees to pay the Edison company the actual amount paid by the latter for the transmission-line cable used in the fourth line installed complete ready for service, including all testing, teaming, freight and handling charges, and an additional allowance of 3 per cent of the amount so expended by the company to cover the engineering expenses of the company exclusive of duct and manhole costs and not exceeding \$120,000. The company agrees to pay 4 per cent interest on the total amount paid by the United States. The cable installed under these provisions becomes the property of the United States, but so long as it is required for the purpose of supplying energy to the arsenal it can be used by the company for that purpose only without further payment to the United States than the interest above mentioned. If and when, before Jan. 22, 1921, the United States shall have paid the company \$500,000 for electrical energy, the company is then to repay to the United States the amount paid for the fourth cable, which thereby becomes the property of the company; but the company is not obliged to repay this amount, except at its option, before Jan. 22, 1920, although before then the United States may have paid the company over \$500,000 for energy.

FINAL PROVISIONS OF CONTRACT

If the supplemental contract is not extended on Jan. 22, 1920, and the United States has not then paid the company a total of \$500,000 for energy, or if the contract is extended and at the end of three years the United States has not paid the company this total for energy, so that the company is not obliged to repay the amount paid out by the United States for the fourth cable, then the company is to take the title to the cable and pay the United States such an amount as under all the circumstances shall be fair, considering the entire investment which the company has been required to make in order to supply the entire service required by the original and supplemental contracts, the length of time the company furnished energy to the arsenal, the amount of revenue received for this energy, etc. If the parties cannot agree upon a fair amount, the matter is to be referred to the chief of ordnance, United States Army, for determination, and if his determination is not accepted, arbitration is to follow.

All transmission-line cables and associated ducts which are within the arsenal premises and the meters, transformers, service switches and other apparatus usually installed by the company are installed by it in this case but become the property of the United States, which is to pay the entire cost to the company. Reason-

able access to the meters, etc., is provided the company under proper regulations. The switching apparatus installed by the United States in its substation at the arsenal is required to be of a design approved by the central-station company.

SPECIAL CONTRACT FOR HOUSING OF EMPLOYEES

Homes Built for Workmen of Tire Company Are Equipped with Electric Ranges Which Give Satisfaction to Both Builder and Tenant

The Industrial Securities Company, Chicago, which is attending to the housing of employees of the Perfection Tire & Rubber Company, Fort Madison, Iowa, has just completed the construction of twenty-one houses containing every modern convenience, including arrangements for electric cooking. When the question of utility service for these houses was approached it was discovered that the local gas company was not in a financial condition to attend to the wants of the home builders. The local rate for electric service was then 8 cents per kilowatt-hour, the company receiving its energy from Keokuk, Iowa, 20 miles (32 km.) distant.

Arrangements were made with the Fort Madison Electric Company, however, to take the business on a contract, from which the following is an extract:

"The first 7 kw.-hr. per counted room at 8 cents per kilowatt-hour. All energy consumed in excess of this amount at 3 cents per kilowatt-hour. Counted rooms for rate-making purposes include the billiard room, bedrooms in excess of three, dining room, dressing room, garage, conservatory, ballroom, kitchen, library, living room, music room, nursery, office, parlor, reception room if larger than 120 sq. ft. (10.8 sq. m.), sewing room, stable and studio. Rooms not counted include the alcove, attic, bathroom, bedrooms (first three), cellar, closets, coal bins, den, garret (if unfinished), hallways, unfinished rooms, sleeping porch, sun parlor and reception hall if smaller than 120 sq. ft."

It was figured that a family of four or five persons occupying a home of three counted rooms should be able to do cooking, washing, sweeping and lighting electrically through the use of 90 kw.-hr. per month. The use of 90 kw.-hr. billed at the foregoing rate would amount to \$3.75, making an average rate of 4.16 cents per kilowatt-hour. The rate, of course, would be different for houses of different sizes, as the houses constructed have ranged from four to eight rooms each and the families average about five persons each.

When the first unit of ten houses was constructed Standard electric ranges were installed. This installation was completed in December, 1917. The first monthly accounts averaged \$4.50 per month per customer. Since that time the housewives have had more experience with electric cooking, and for the last two months the bills have averaged \$3.85 per customer per month. These housewives have found that the fireless cooker attachment of the range is a great electricity saver.

All houses in the second unit constructed contain Hughes electric ranges.

A. H. Burg of the real estate department of the Industrial Securities Company, in speaking of this installation, stated that most of the families have electric irons, electric washers and vacuum cleaners. For

convenience, the company has installed baseboard outlets in practically every room in all of the houses.

Mr. Burg said further: "We consider that by using electricity in these houses and making liberal use of extra outlets for labor-saving appliances we are giving our working people greater assistance in housework than by the adoption of any other arrangement known at present. The women living in these houses are very well satisfied, which makes for harmonious industrial relations.

"Considering the price of electric ranges and the cost of installations, we do not believe the investment as expensive by 20 per cent as if we had installed gas and bought gas ranges. The electrical installations in these houses were handled just the same as plumbing fixtures. They were purchased by the builders of the houses and are sold with the houses to the tenant as a part of the regular equipment under a general part-payment plan. Under this plan the tenant pays for all of the electricity as well as the water used during his occupancy."

THE MARGIN OF RESERVE CAPACITY IN WAR TIME

Record of Reliability Must Not Fail, Nor Must Central Stations Be Made to Distinguish Between Essential and Non-Essential Customers

In view of the difficulty of securing funds with which to carry forward central-station plant developments looking toward substantial capacity increases, coupled with long and uncertain deliveries of installation of generating equipment for ordinary commercial service, the question of allowable reserve capacity assumes more than usual interest and importance. A great deal of thought has been expended upon the safe allowance for reserve which a central station should plan to maintain, and a widely acceptable expression of this allowance is found in the custom of retaining a reserve equal in rating to the largest generating unit of the station. The question now is, shall a closer margin be permitted in view of the relatively large amount of war business being served by the central stations, its non-permanent character and the willingness, for the present at least, of ordinary users to suffer some inconvenience in case of plant trouble?

At a recent round-table conference of the managers of a group of central stations this question was discussed at some length. The point was made that the war business must be served first, last and all the time, and that it exercises an absolute priority against ordinary commercial service. The view was advanced that a central station should go very slowly at present in increasing its capacity except for war service, and that the reserve capacity may properly be allowed to decrease considerably before the utility draws upon the resources of the manufacturers and the bankers for plant enlargement for commercial demands pure and simple. In case of a failure of units, partial or complete, the argument ran, let the war service be supplied first, and if trouble makes it necessary for the commercial service to be cut off to a greater or less degree until repairs can be effected, let the consumer of said commercial service do the worrying. Then when the war is over the amount of invested capital to be carried in plant will be less than if expansion had followed the ordinary

lines, and in the meantime resources will be more effectively devoted to purely war purposes.

As soon as the central-station manager attempts to classify his customers as essential and non-essential to the war work of the country, he takes upon himself an exceedingly heavy responsibility and a most difficult task. The whole central-station industry has been built up on the basis of a remarkable record for reliable service, and so far as possible this record should not be allowed to fall off during the war period. It is unquestionably true that the munitions plant should be the first to be supplied with service in case of trouble, but surely the efforts of the central station should not stop here. A conservative policy with respect to taking on new business is one thing, and cutting off or threatening to discontinue existing customers is another. Expansion of plant must proceed to-day along lines with which the government is in sympathy, but even more in serving war customers is a substantial reserve in plant capacity most desirable. Through the practice of economies in operation the existing equipment can be made to do much more work in many cases than before; and through interconnection for energy interchange between adjacent plants, no matter whether of common or unrelated ownership, a good deal of reserve capacity formerly held against the "rainy day" in a particular station can be released for other uses. Here, indeed, will be the probable solution of not a few plants seeking to maintain a safe reserve in the face of what is almost a governmental interdiction of local station expansion along the orthodox lines. As the amount of war business to be handled grows, new equipment must of course be added in many cases, and if interconnection, extending in some instances to local mill plants and even to office-building and similar power installations, is worked out along proper engineering lines, the bogie of the shrinking individual reserve will tend to disappear, and along with this advance will go a maintained service reliability which will always be the pride of the industry.

NO FREE RENEWALS FOR SMASHED LAMP BULBS

The Boston Policy of Placing Burden of Careless Breakage on Customer Has Worked Out Satisfactorily

The Edison Electric Illuminating Company of Boston, which has been very liberal in regard to broken and lost lamps, has found that present-day conditions have made certain economies necessary, among them being a change in lamp policy outlined in a notice sent to customers which stated that on and after Feb. 15, 1918, a charge would be made for lamps replaced where the glass is broken. This does not change the renewal service furnished by the company, but places the burden of careless and excessive breakage on the customer.

The handling of broken lamps under the new rule has been in effect now for more than two months with remarkable success, the company states, and is operating with notable smoothness. The customers seem to appreciate that property furnished for their use by the company must be properly handled and receive due care in order to prevent its unnecessary destruction.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press,
of the World

Generators, Motors and Transformers

Alternating-Current Asynchronous Motors with Short-Circuited Rotors.—J. A. MONTELLIER.—Practical notes upon the theory and performance of these machines, the use of which in silk-weaving and similar factories was recently advocated in the same journal. *L'Industrie Electrique*, April 10, 1918.

Induction Generators with Phase Advancers.—Dr. Kapp in the discussion on L. B. Wedmore's paper at the Birmingham meeting of the Institution of Electrical Engineers made a strong plea for the use of induction generators in conjunction with synchronous generators and phase advancers to simplify and reduce the cost of protective devices and switch gear of large generating stations. The phase advancers would enable the induction machines to take their fair share of the reactive component of the load. In the editorial comment on this paper it was stated that the reliability of the phase advancer must be considered in comparison with the exciter. The use of governors with induction generators, the mechanical difficulties arising from small air gaps of the induction machine, the need of a laminated rotor, the loss in the end bells due to induced currents of slip frequency, and so on, must also be considered. Where it is merely a matter of supplying reactive current, it is probable that the future great demands will be made on the rotary converter rather than on the induction generator, and when the adoption of the latter machine to simplify switch gear does prove feasible, it should be seriously investigated before action is taken.—*London Electrician*, April 5, 1918.

Standardization of the Ends of Electric Motor Shafts.—A step toward further standardization has been taken by the electrical constructors of France in adopting uniform dimensions for shaft ends. A table of these is given.—*Revue Générale de l'Electricité*, April 13, 1918.

Mechanical Design and Specifications of Turbo-Alternator Rotors.—S. F. BARCLAY.—Concluding paper on the subject read before the Institution of Electrical Engineers. In this section the design of rotor end bells is described, together with the best methods available for procuring adequate ventilation.—*London Electrician*, March 29, 1918.

Ventilating System for Steam Turbine Alternators.—E. KNOWLTON and E. H. FREIBURGHUSE.—The power output which can be obtained from generators depends for the most part on the dissipation of heat in the machine. While natural ventilation methods are adequate for generators driven by slow reciprocating engines, a greatly increased amount of air is required owing to the change in the method of operation. Excessive temperature shortens the life of the insulating material, decreasing it in proportion to the temperature and the time during which it is maintained. Curves are given which show the percent of rated loads which turbine

alternators can carry as a function of the temperature of the entering air.—*General Electric Review*, April 1918.

Elementary Principles of Continuous-Current Armature Windings.—F. M. DENTON.—This is an article continued from the issue of April 5, in which continuous-current armature windings are classified and the derivations of the usual winding rules are developed by a simple method based upon an understanding of the well-known Gramme ring type. The rules governing multiplex, single re-entrant, treble re-entrant and series-parallel windings are also considered.—*London Electrician*, April 12, 1918.

Lamps and Lighting

High Candle-Power Projection Incandescent Lamps.—A considerable amount of work on the design of incandescent lamps for projection work has been carried out of late. According to a recent contribution by O. Kruh in *Elektrotechnik und Maschinenbau*, it has now been found possible to make lamps taking up to 200 amp. and giving 30,000 to 40,000 hefner candles. While even 100,000 candles is considered practicable, the chief limit is the size of the lamp bulb. The great difficulty hitherto in constructing such high-candle-power lamps has been with the leading-in wires. It is not easy to secure an air-tight joint for such high currents, but according to the author this can be done by a special method, which, however, he does not disclose in this article. Such lamps work at about 0.25 watt per candle (hefner). The filaments are mounted in the form of straight bars, as close together as possible, and their useful effect is increased by the use of concave mirrors behind the filaments, the latter being at the center of curvature of the mirror. The mirror can be so adjusted that the image of the filaments completely covers the interstices between them.—*London Electrician*, April 12, 1918.

Generation, Transmission and Distribution

Electric Power Supply and Coal Conservation.—The problems which would be involved in assembling more than 600 segregated districts into a comprehensive system, in selecting sites for the proposed super-power stations and in combining by-product plants with the generating plants are subjects discussed in this article, which represents a discussion on the interior report of the coal conservation sub-committee on electric power supply of Great Britain.—*London Electrician*, March 29, 1918.

Some Advantages of Central-Station Service.—W. S. BUCHANAN.—The prevalent practice to-day is toward centralization of energy production and the elimination of the isolated-plant idea, with the object of effecting substantial economies in both operating costs and fixed charges. This article discusses this subject in detail.—*The Central Station*, April, 1918.

Ventilation System for Steam-Turbine Alternators.—E. KNOWLTON and E. H. FREIBURGHUSE.—The cause of moisture condensation on the internal parts of the generator and the means of preventing this troublesome condition are discussed.—*General Electric Review*, May, 1918.

Types of Electric Motors, Their Construction and Characteristics.—GORDON FOX.—Some desirable features that should be embodied in a motor are outlined to assist in the selection of machines from the standpoint of mechanical design and construction. The subject is discussed under the following headings: Pole pieces and armatures, the commutator, windings, brush-holders and brushes, and bearings.—*Power Plant Engineering*, May 1, 1918.

Control of Large Amounts of Power.—E. B. WEDMORE.—Protection of systems in which a large amount of power must be generated and distributed was discussed in a paper read by the author before the British Institution of Electrical Engineers. The chief subject dealt with was limitation of disturbances by sectionalizing and by the employment of reactances. Under the latter head generator reactances, feeder reactances and busbar reactances were considered. Improvements of power factor, the interconnection of stations, influence of live load on short-circuit current and limiting disturbances by the use of protective relays were other subjects discussed. The appendix gives the rupturing capacity of oil switches, rating of reactances, desirable arrangement of busbars, the value of busbar reactances in limiting current, the extent to which load can be transferred through reactances, considerations that should be taken into account in designing current-limiting reactances, etc. Diagrams are given showing the force exerted on parallel conductors carrying current, a typical oil switch and a typical isolated switch subject to large forces and small forces. Various curves showing the effect of different methods of reducing short-circuit current are also given. An arrangement permitting the maximum transfer of load is illustrated. The author says that from experience with stations designed in recent years and having a maximum short-circuit current of ten times their normal rated output, it is necessary that the smallest current transformer on the main switch-board should have a carrying capacity of not less than one-twentieth of the station output.—*London Engineering*, April 19 and 26, 1918.

Standardized Flexible Distribution Systems in Industrial Plants.—BASSETT JONES.—The second and concluding article on the subject gives the method of installing a lighting system in the new factory of the Sprague Electric Works at Watsessing, N. J. The arrangement of the entire system is produced and photographs of the installation are given.—*General Electric Review*, April, 1918.

Joining High-Tension Underground Cables.—While cables laid in bad condition may give good service for years, faulty joining will probably cause constant trouble. Three things are necessary in this connection—a good union of the conductors, insulation of the joint, and protection of the joint against dampness. Apart from accidental defects, the most common causes of destruction are external injury, chemical action, electrolysis, earth slides, floods, vibration and overten-

sion. The author considers the best means of combating these sources of injury, including two methods of protection against electrolysis—first, connecting the lead sheath to earth; second, the insulation of the sheath from the earth.—*Boletín de la Asociación Argentina de Electro-Técnicos* (Buenos Aires), February, 1918.

Installations, Systems and Appliances

Electric Winding Engine.—JOHN F. PERRY.—The chief systems of electric winding are briefly described and their merits compared with the steam methods. Eight alternative schemes are presented. The distribution of energy losses and working and initial costs are analyzed by the aid of diagrams. A table is given showing the performance of electrically driven winding engines, giving the depth of the pit, the output per ton-hour, net load, etc.—*London Electrician*, April 5, 1918.

Electrophysics and Magnetism

Photoelectric Effects on Mercury Droplets.—JOHN B. DERIEUX.—It has been shown that never more than one elementary charge at a time is detached from a neutral air molecule by primary or secondary X-rays. It seems probable that in the photoelectric effect on mercury droplets two electrons are never liberated at the same time, and that when two liberations appear to be simultaneous there are really two distinct liberations, the interval between them being too short for the observer to separate them. In investigations with mercury droplets subjected to long wave lengths the lines were too faint to give a rapid discharge even with the collimator slit open wide and the lamp operating on high energy owing to the minuteness of the droplets. The long wave-length limit evidently lies between 253.5 μ . and 312.6 μ .—*Physical Review*, April, 1918.

Young's Modulus of Drawn Tungsten.—H. L. DODGE.—This paper is the fourth of a series upon the effect of temperature on the elasticity of tungsten wires. Tests were made upon a piece of drawn tungsten wire containing approximately 99 per cent tungsten and 1 per cent thorium. The Young's modulus of drawn tungsten was found to be 35.5×10^{11} dynes per square centimeter at 20 deg. C. The modulus decreases uniformly with increase of temperature up to 1000 deg. C., at which temperature it is 32.3×10^{11} dynes per square centimeter.—*Physical Review*, April, 1918.

Theory of the Oscillations of the "Singing" Arc.—LIEUT.-COL. J. B. POMEY.—The author works out a problem to show what the amplitude of the oscillating current of the "singing" arc depends on and gives a formula by which a close approximation to the value of the efficient intensity of the singing oscillatory current may be derived.—*Revue Générale de l'Electricité*, April 20, 1918.

Electrochemistry and Batteries

The Fixation of Atmospheric Nitrogen.—In the *Zeitschrift des Vereines Deutscher Ingenieure*, H. Andriessens describes an arrangement working on the same principle as the Birkeland furnace for obtaining nitrogen by the direct combustion of air and for which 80 per cent higher output is claimed by the adapter. In the Andriessens furnace it is the aim to obtain the maximum linear extension of the arc and the minimum flame surface, on the ground that the reaction velocity

between nitrogen and oxygen is extraordinarily high, so that the sooner the products can be removed from the flame zone the less the extent to which dissociation will occur. The nitric oxide should be cooled down in the shortest possible time, the writer says, but previous methods do not take account of this requirement. To obtain the maximum length arc with the smallest flame surface an air blast is delivered between two vertical rod electrodes set below but in the same vertical plane as the line joining the poles of a powerful electro-magnet. The net result of the air blast and magnetic field is to spread the arc over a surface limited by a helix which may have a pitch of only a few millimeters. The air velocity may be four times that usual in the Birckland furnace. From a 35-kw. furnace the yield may be 70 gm. (referred to 100 per cent nitric acid) as compared with 30 gm. to 45 gm. from a Birckland furnace of equal power, it is said.—*London Electrical Review*, April 12, 1918.

The Storage-Battery Industry.—L. JUMAU.—In this article, which is a sequel to others published in the *Revue Générale de l'Electricité* for Aug. 4 and Oct. 6, 1917, the author describes the principal processes used in making electrodes for lead storage batteries and the different methods employed for mounting them. He sums up the results that may be obtained with storage batteries such as ampere-hour capacity, life of the electrodes, etc.—*Revue Générale de l'Electricité*, April 20, 1918.

Units, Measurements and Instruments

Losses in Sheet Iron at High Frequencies.—MARIUS LATOUR.—In this study, communicated to the International Society of Electricians in its session for 1918, the author determines the power dissipated separately in the form of Foucault currents and hysteresis in a sheet of iron, admitting that there is a constant angular retardation between the induction in the iron and the field which produces it. From this he deduces the thickness which the sheet iron of an apparatus fed by a high-frequency current ought to have in order that the minimum total power should be dissipated. Then he calculates the extent to which the voltage and the current in the circuit of a self-inductive coil are out of phase.—*Revue Générale de l'Electricité*, April 13, 1918.

Miscellaneous

Hydroelectric Power—Its Relation to Industry.—J. A. JOHNSON.—The author says: "The nation is facing the greatest crisis in its history, not only in a military sense, but in a political and economic sense, and we are on the eve of a great development of the hydroelectric power resources of this country." He then goes on to outline different types of hydroelectric development, pointing out how some have uniform continuous flow of water and others have variable flow, discusses the cost of developing hydroelectric power and calls attention to the results of failure to co ordinate power developments and industrial applications.—*Metallurgical and Chemical Engineering*, May 1, 1918.

The Electric Commercial Vehicle.—The electric truck is desirably fulfilling service requirements due to the increased capacity and improved operation obtainable with present storage batteries. A vehicle equipped with a standard battery and having a carrying capacity of 1000 lb. to 1500 lb. (453 kg. to 680 kg.) will run about 50 miles (80 km.) on one charge, while the larger

sizes carrying from 3 tons to 5 tons will travel from 35 miles to 40 miles (56 km. to 64 km.). The lack of battery-charging facilities that heretofore existed has now been overcome considerably, and there is no doubt that the commercial electric vehicle is here as a permanent transporting medium. The running costs of this type of electric vehicle are low in spite of the fact that the initial outlay is higher than for either steam or petrol wagons. The depreciation on an electric vehicle may be figured at 10 per cent, while 15 per cent is reasonable for the petrol wagon.—*London Engineer*, April 12, 1918.

How the Electric Truck Releases Men for Productive Work.—F. C. MYERS.—Seven examples show how as many as several hundred men have been released from the work of handling material in industrial plants through the installation of carrier and tractor trucks each of which has its field of application and operates economically under certain conditions. The carrier trucks carry their load, while the tractor trucks pull their load along. Neither type depends on tracks or special roadway. Grades up to 15 per cent can be negotiated without trouble, but the steepness of the grade will, of course, decrease the weight that can be carried or hauled. In some instances wooden runways and concrete yard roadways are desirable. The average cost of operation for a ten-hour day is approximately \$1.20 in the plants referred to, including interest, depreciation and maintenance.—*Industrial Management*, April, 1918.

Fuel Problem in the Middle West.—A. A. POTTER.—That future emergencies can be averted by more adequate fuel storage, by greater attention to fuel economy, by the more careful regulation on the part of the government of the quality of fuel leaving the mines and by bettering fuel-transportation facilities is the opinion of a number of power plants in the Middle West, says the author. The larger power plants are expecting to store greater amounts of coal than usual. Some plants expect to provide storage capacity sufficient for thirty days. Spontaneous combustion has caused some difficulty in storing many of the Middle Western bituminous coals, but storage under water will be used to a considerable extent. W. L. Abbott, chief operating engineer of the Commonwealth Edison Company, states that in addition to the investment in land for storage facilities and the railway improvements attached thereto there is considerable expense in carrying coal over year after year; but even this outlay and expense is warrantable from a business point of view. A detailed study of coal-car movements in the Middle West during the past four years discloses the fact that the average time required to move cars is extremely long. In most cases cars carrying coal will average less than 20 miles (32 km.) per day. When this time is added to the time required for empty cars to return to the mines, it is evident that the coal tonnage handled per car per year is very limited and very much smaller than reasonably efficient operation should produce. This delay is partly blamed upon the railroads for throwing cars on sidings and into yards with unnecessary switching, instead of delivering them to their destination in one or two hauls. Pooling of engines, cars and routes and routing coal so as to avoid large cities will tend to improve the situation.—*Journal of the American Society of Mechanical Engineers*, May, 1918.

PRESENTATION OF EDISON

MEDAL TO COLONEL CARTY

Chief Engineer of the American Telephone & Telegraph Company, Now Serving in the Army Signal Corps, Receives Honor

A large audience, gathered in the Engineering Societies Building, New York, at the annual meeting of the American Institute of Electrical Engineers on May 17, witnessed the presentation of the eighth Edison medal to Col. John J. Carty of the United States Army Signal Corps, chief engineer of the American Telephone & Telegraph Company. The award of the medal to Colonel Carty for his work in the science and art of telephone engineering was announced in the *ELECTRICAL WORLD* of May 4, 1918.

Those to whom the medal has been awarded in previous years are Elihu Thomson, Frank J. Sprague, George

COL. J. J. CARTY

Westinghouse, William Stanley, Charles F. Brush, Alexander Graham Bell and Nikola Tesla.

Dr. A. E. Kennelly, professor of electrical engineering at Harvard University and Massachusetts Institute of Technology, told of the history and significance of the medal.

Dr. Michael I. Pupin of Columbia University said: "Carty's life is filled with romance. He never went to college. At the age of eighteen, when other boys entered college, he entered the service of the American Bell Telephone Company and at the age of twenty-eight became chief engineer of the great New York Telephone Company."

E. W. Rice, Jr., president of the Institute, made the formal presentation of the medal.

In accepting the medal Colonel Carty gave credit for the American telephone achievements to the engineers who have been associated with him in the Bell system

and paid a tribute to Major-General George O. Squier, chief signal officer of the United States Army.

The newly elected Institute officers, who serve during the administrative year beginning on Aug. 1, 1918, were the directors' nominees, as follows:

President—Prof. Comfort A. Adams, Harvard University and Massachusetts Institute of Technology, Cambridge, Mass.

Vice-presidents—Allen H. Babcock, San Francisco; William B. Jackson, Chicago; Raymond S. Kelsch, Montreal; F. B. Jewett, New York; Harold Pender, Philadelphia; John B. Taylor, Schenectady, N. Y.

Managers—G. Faccioli, Pittsfield, Mass.; Frank D. Newbury, Pittsburgh; Walter I. Slichter, New York.

Treasurer—George A. Hamilton, Elizabeth, N. J.

WESTINGHOUSE BUSINESS

TOTALS LARGE FIGURES

Value of Unfilled Orders on April 1, 1918, Is \$147,000,000, of Which \$110,100,000 Is for Regular Products of Company

Evidence of the large demand upon electrical manufacturing companies is shown by the statement in the annual report of the Westinghouse Electric & Manufacturing Company that, as of April 1, 1918, the value of unfilled orders in hand was \$147,857,580. Of this amount \$110,185,007 was for regular products of the company. On March 31, 1917, the value of unfilled orders for regular products of the company was \$39,776,739. Sales billed in the fiscal year ended March 31, 1918, by the company and its proprietary companies, except the New England Westinghouse Company, aggregated \$95,735,407. This total compares with \$89,539,442 in the preceding fiscal year. The amount of sales billed, as stated for the year just ended, includes shipments since June 15, 1917, from the machine works (formerly Westinghouse Machine Company), also \$4,536,000 for munitions.

"The volume of sales billed for the regular products of your company," says Col. Guy E. Tripp, chairman of the board of directors, "was greatly in excess of any previous year."

In mentioning the large total of unfilled orders in hand, Colonel Tripp adds: "No facilities heretofore employed on regular products are engaged on munition work."

Colonel Tripp said in part in speaking of the work and changes of the year:

The plan referred to in the report for last year for the merger of the Westinghouse Machine Company with your company was made effective as of June 15, 1917. The accounts of the two companies were consolidated on a basis that resulted in no change in the surplus of your company because of the merger.

The property and plant account includes expenditures during the year in connection with the new plant known as the Essington Works, located near Philadelphia, to which reference was made in the report for last year. This plant,

which is now completed and nearly equipped, is operating with a force of about 3000 men, which it is expected will be increased to approximately 5000 during the year. Contracts with the United States government for equipment for cargo ships will occupy the capacity of this plant for approximately two years.

Another important improvement completed during the year is a factory at Trenton, N. J., for the manufacture of incandescent lamps. This factory has been in operation for some months.

The increase in investments includes a subscription for Liberty loan bonds of the second issue, the only other important additions being the capital stocks of other companies acquired under the merger of the Westinghouse Machine Company and your company.

In the latter part of 1916 a proposal was submitted to your directors for the purchase of a small portion of your holdings in the British Westinghouse Electric & Manufacturing Company, Ltd., in order that a controlling interest might be transferred from the United States to England. After careful consideration your directors concluded that the commercial position of the British Westinghouse Electric & Manufacturing Company, Ltd., would be improved if the control of that company were owned in England instead of the United States, but decided that the sale of your entire holdings was the only satisfactory solution of the situation. Accordingly negotiations were concluded under which your holdings of 4 per cent debenture stock and preference and ordinary shares in the British company were sold to a syndicate formed in London (Electric Holdings, Ltd.) and payment therefor has been received in 5 per cent prior lien debenture bonds maturing in ten years. These bonds are secured by the pledge of all the said securities sold and certain other additional collateral. This change in your investments was made without change in book values and has, therefore, not affected the balance sheet.

Certain new trading agreements of mutual advantage have been entered into between the British company, Electric Holdings, Ltd., and your company. The great increase in the demand for the regular products of your company, as shown by the volume of business completed during the year and by the volume of orders in hand, has required large increases in working and trading assets.

The consolidation of accounts resulting from the merger of the Westinghouse Machine Company with your company brings into the balance sheet this year the outstanding balances of bonds and debentures issued by the Machine company. The total of the annual sinking fund requirements with respect to all these issues is \$150,000.

Your company's ten-year collateral notes, aggregating \$2,720,000, maturing Oct. 1, 1917, were paid and the collateral has been returned to the treasury of the company. Additional notes of the issue of fifteen-year 5 per cent notes due Jan. 1, 1924, were offered during the year and redeemed, leaving only \$52,500 outstanding of the several issues of notes made in 1909.

Reference has already been made to the large increases in inventories made necessary by the unprecedented volume of your company's business. As a result your company during the year increased the total of its outstanding notes payable by \$12,282,301, the total amount of notes payable outstanding as of March 31, 1918, being \$30,186,051. This includes \$15,000,000 one-year notes and \$2,433,551 on account of Liberty loan bonds subscribed for by your company and its employees.

In the report for last year you were advised of a modified agreement made with the British government with respect to the contracts for the manufacture of Russian rifles. The New England company under this modified agreement was regularly producing rifles in excess of the originally estimated capacity of its plants, but when slightly more than 1,000,000 rifles had been delivered, and probably because of the conditions arising in Russia resulting in the withdrawal of that country from the war, the British government in December, 1917, exercised its privilege of cancellation of the undelivered part of the contracts. However, almost simultaneously with the receipt of this notice of cancellation inquiries were received from the United States government as to the manufacture by the New England company of heavy Browning machine guns. Negotiations resulted in the receipt of orders from the United States government, thus

enabling the New England company to retain its organization, not only to its own advantage but especially to the advantage of our government in having available for immediate use both manufacturing facilities and a trained organization for the production of machine guns. Deliveries began in April and are in advance of the schedule fixed by the contract.

The cancellations of the Russian rifle contracts resulted in your company sustaining the full loss of \$5,000,000, against which a reserve in that amount was set aside last year. Your directors therefore authorized the absorption of this amount in said reserve. The necessary entries were made as of Dec. 31, 1917, so that the books of your company as of March 31, 1918, include no accounts relating to the contracts for Russian rifles.

The entire outstanding capital stock of the New England Westinghouse Company is owned by your company and is carried at a valuation considerably below the estimated value of its real estate and buildings and other assets which are free of all indebtedness or encumbrance of any nature. The contracts with the United States government for machine guns are on a cost plus basis.

The abnormal conditions prevailing during the year called for unusual effort on the part of the officers and employees of your company. The board of directors has pleasure in hereby expressing its appreciation of the efficient manner in which the unusual conditions were met and the general devotion to the company's interests evidenced throughout the year.

The income account for the last year follows:

Gross earnings—Sales billed.....	\$95,735,407
Cost of sales—Factory cost, including all expenditures for patterns, dies, new small tools and other betterments and extensions; also depreciations of property and plant, inventory adjustments and all selling, administration, general and development expenses and all taxes.....	80,225,937
Net manufacturing profit.....	\$15,509,470
Other income—interest and discount.....	\$308,835
Dividends and interest on sundry stocks and bonds owned.....	903,559
Miscellaneous—royalties, etc.	112,869
	1,325,263
Gross income from all sources.....	\$16,834,733
Deduction from income—interest on bonds and debentures	\$303,917
Interest on notes payable.....	1,108,046
Miscellaneous interest	17,089
	\$1,429,052
Net income available for dividends and other purposes	\$15,405,681

The surplus as of March 31, 1917, \$18,105,298, was increased by the net income of \$15,405,681 for the year, making the gross surplus \$33,510,979.

In addition to the regular quarterly dividends at the rate of 7 per cent per annum on the preferred and common stocks, a special "Red Cross" dividend was paid, making a total of \$5,610,848 for all dividends paid during the year.

Special appropriations were made for the protection of inventory book values and to establish a research and development fund. After deducting these appropriations and other miscellaneous adjustments the net surplus as of March 31, 1918, is \$26,404,694, an increase of \$8,299,396 over the net surplus as of March 31, 1917.

Damage by Tornado in District of Iowa

A tornado twisted through Newton, Iowa, on Tuesday of the present week. Some damage was done to the buildings of several washing-machine manufacturers, but a representative of the ELECTRICAL WORLD telegraphs from that district that these companies will make deliveries as usual and that output will be curtailed for only a few days. The electric central station was not injured, but the damage to poles and lines is estimated at \$5,000. Telephone and telegraph lines were also damaged.

WATER POWER COMMITTEE BEGINS TO FRAME BILL

W. H. Onken, Jr., Shows that Industries Depending on Hydroelectric Energy Are Far More Valuable than Generating Systems

The joint water-power committee of the House of Representatives has begun the framing of the bill which will be based upon the so-called administration water-power bill and is to be reported to the House in the form of an amendment to the Shields bill passed by the Senate some time ago.

It was intended last week that hearings should continue for the benefit of some members of the House who desired to be heard, but the committee decided to close the hearings and held the record open only for the insertion of a statement prepared by William H. Onken, Jr., editor *ELECTRICAL WORLD*, who had attended all of the hearings, and who, because of the unbiased position in controversy of the editor of the *ELECTRICAL WORLD*, it was felt, could treat of subjects which had not received much attention at the hearings. Mr. Onken's statement ended the taking of testimony.

It is not known in Washington when the bill will be reported to the House. A number of points, it is stated at the office of the committee, have been tentatively agreed upon, but it is expected that there will be much discussion over a proposal being made by Representative Anderson of Minnesota and Representative Raker of California that the commission provided for in the bill shall consist of more than the Secretaries of War, Interior and Agriculture. It is stated that these Representatives are urging a commission of five, two members to be experts in water-power legislation and administration, although not necessarily engineers.

A COMMON FALLACY

In Mr. Onken's statement he pointed out that it is a fallacy to believe that in granting a license to develop water power the government is parting with something that is very valuable, for, he said, the value rests not in the water power itself, nor in any great measure in the electricity generated from it, but to an enormous degree in the industries, cities, farms and homes dependent on electricity as a modern necessity. The industries depending upon electricity are infinitely more important, he said, than the electric generating systems. He directed attention to the enormous savings made possible by hydroelectric development, and said that during 1917 540,000,000 tons of bituminous coal were mined, requiring the employment of more than 500,000 men and for its shipment the movement of hundreds of thousands of cars and locomotives.

"Since on the average it requires 1000 tons of coal to produce 125 hp.-years of electricity," Mr. Onken said, "35,000,000 undeveloped water horsepower put to use would save the necessity of mining 280,000,000 tons of coal per annum and the labor of from 500,000 to 700,000 men." These men, he said, would be available for military and industrial purposes.

Mr. Onken also said:

"As typifying what hydroelectric development means to a community and at the same time showing the enormous waste caused by non-development, the case of Niagara Falls is unique. The mighty cataract alone, not including the rapids, is capable of developing

5,000,000 hp. This, if sold at the modest rate of \$20 a horsepower year, or what is equivalent to 3 mills per kilowatt-hour, would yield a revenue of \$100,000,000 per annum. This amount of money is equal to a 5 per cent return on an investment of \$2,000,000,000, and yet what government would spend that stupendous amount of money to reproduce the spectacle? It is true, we have power companies which develop a fraction of the power available, but the roar of Niagara is as nothing compared to the din of the industries set in motion by the electricity generated from only a fraction of the water in the cataract.

THE SITUATION AT NIAGARA FALLS

"At Niagara Falls are the greatest electrochemical industries of the world. More could be established there if more power were available, but because of the shortage of power many have been forced over into Canada and still others have gone abroad. These electrochemical industries are of vast importance to this nation. They started at Niagara Falls and for the greater part they still remain, handicapped as they are for want of electricity. On these electrochemical industries depend numerous other industrial establishments throughout the country, valuable in times of peace, but infinitely more valuable in the critical times of war.

"First of the electrochemical enterprises in point of electric power requirements is the aluminum industry. Next in line come the ferro-alloy compounds, including ferro-silicon, ferro-chromium, ferro-molybdenum and so on. The next electrochemical industry in point of size is devoted to the manufacture of calcium carbide, used chiefly in the production of acetylene. Artificial abrasives, which constitute the basis of all modern grinder work, are also manufactured at Niagara Falls, as well as caustic soda, chlorine in the form of bleaching powder and other chlorine products; chlorates, which are used in the match industry, in the textiles, for the manufacture of oxygen and in other chemical operations; sodium, used in the textile industries as a bleaching agent and which is still more important in the manufacture of sodium cyanide; phosphorus, carbon bisulphide and numerous other products absolutely indispensable to industry to-day.

"I need not call the attention of the committee to the importance of aluminum and aluminum products. The ferro-alloys, however, give one a very good idea of how indispensable the products of the electrochemical industry are. Approximately 75 per cent of all the steel made in this country to-day is made in the basic open-hearth furnace, and all that steel requires in its manufacturing the use of ferro-silicon. In other words, the whole of the steel industry in this country is at the present time dependent on ferro-silicon made in the electric furnace by the application of electric power. With no ferro-silicon there can be no open-hearth steel.

GREAT IMPORTANCE OF ELECTROCHEMICAL INDUSTRIES

"The artificial abrasives show the extreme importance of electrochemical industries to other general industries. The automobile and aeroplane furnish a citation. All of the abrasives used in this country at the present time are electric furnace products. Now, there is hardly a single portion of an automobile or of an aircraft that has not got to be ground in some form or

other. There is not a single bit of steel in the automobile that is not dependent on the electrochemical industry for ferro silicon. There is not a single part which has been lightened in weight that does not involve the use of ferro-chromium. By the use of alloy steel alone the weight of automobiles has been cut in half and at the same time increased in strength and reduced in cost. So greatly does the automotive industry depend on these products that without the use of the high-speed tool steels which the electrochemical industries alone make possible, and without the use of the grinding wheels which the electric furnace has given to the world, a plant which can manufacture 500 cars a day could turn out only 100 cars a day with the same outfit and the same men.

"It is needless for me to continue further along this line to impress you with the vast importance of electrochemical products to other industries, ignoring entirely the fixation of atmospheric nitrogen for fertilizer and for munition work. I merely cite the case to show how infinitely more important are the industries depending upon electricity than the electric generating system itself. It is of interest to note in this connection that the combined income from the sale of electrical energy of the Niagara Falls Power Company and the Canadian Niagara Power Company for 1917 was a trifle more than \$3,000,000. I have no statistics showing the output of electrochemical products manufactured from the electricity sold for that purpose nor the cost of the numerous other products which in their fabrication involve electrochemical products. However, the citations given indicate the stupendous value of these products as compared with the cost of the electricity used in their manufacture."

Using Water Power for Lighting Battery Dug-Outs in France

This French official photograph, received from the ELECTRICAL WORLD correspondent in France, shows an improvised waterwheel for generating energy to light the dug-outs of a French battery.

THE ECONOMIC VALUE OF THE SUPPLY JOBBERS

Association Decides at This Week's Hot Springs Meeting to Make Their Economic Function Clear—Co-operation with Contractors

At the regular meeting of the Electrical Supply Jobbers' Association held this week at Hot Springs, Va., the association, on the invitation of a committee from the National Association of Electrical Contractors and Dealers, voted to co-operate with the latter body in furthering the education of contractors and dealers in cost accounting and in proper merchandising methods.

CO-OPERATION WITH THE CONTRACTORS

To that end the committee of the jobbers' association on harmony in the industry recommended that jobbers having a retail business become members of the contractors' association and that they also urge all contractors and contractor-dealers to join, as well as dealers and merchants conducting retail electrical departments. In addition, a committee from the jobbers' association will attend the meeting of the contractors' association to be held in Cleveland next July.

There being a division of opinion as to what constituted retail business, which is the basis on which dues in the contractors' association are paid, that term was definitely defined by the committee in its recommendation. In general, the term as defined and accepted by the jobbers excluded sales to industrial plants.

ECONOMIC FUNCTION OF THE SUPPLY JOBBER

On the recommendation of the Atlantic division, the main body decided unanimously on Wednesday to appoint a committee to investigate all channels of publicity by which the position of the supply jobber may be strengthened in the electrical trade. The agitation against all jobbers as middlemen, which, although it has heretofore existed in a mild form, has taken more definite shape and purpose since the government itself advocated direct purchases from manufacturers, has been brought home to the consciousness of the electrical supply jobbers, and it was felt that the functions of the supply jobbers are not known, or, if known, are not properly appreciated in the electrical trade.

All middlemen are now under fire so to speak, and manufacturers are doubtful as to the proper channels to choose for the distribution of their goods. There is an unfounded suspicion that all electrical supply jobbers do is to meet every so often behind closed doors to decide upon and fix prices. Of course, those who have attended jobbers' meetings know that this is not so, but that knowledge is not so general as it might be. In addition, full advantage is not taken of jobbers' supplies by industrial plants, which, through lack of knowledge of the presence of jobbing houses in the immediate vicinity or the completeness of jobbers' stocks, order directly from manufacturers, oftentimes at a loss of time and money. To rectify this system and to set the jobber right with the trade and with the world, the association plans to embark on a campaign of educational publicity.

The appeal will be to the manufacturer as well as

to the purchaser and will dwell on the functions of the jobber which make his existence a necessity and his service of definite value to the consuming public. As an unfailing source of supplies and also as a banker in a limited sense, the jobber is already better known by the contractors than by any other branch of the electrical industry, and it is the purpose of the association to give manufacturers, owners of industrial plants and the public the same insight into the jobbing business as that possessed by the electrical contractor and dealer. An effort will be made also to impress the latter with the value of the service the jobber renders him.

It was decided to have the committee undertake this investigation at once so that it could lay its plans before the executive committee for action as soon as possible. A suitable appropriation of money is to be thereupon made to carry on the work, which will be restricted at present to the trade and trade press.

Other matters brought up for discussion on Wednesday included a system of cost accounting. Duplicating the contribution made last year, the jobbers again donated from their funds \$2,000 to the American Red Cross.

ATLANTIC DIVISION JOBBERS SURVEY CONDITIONS

At the meeting of the Atlantic division on Tuesday a general survey was made of the conditions in the electrical industry. This was both instructive and interesting. The conditions of business in the East remain fairly normal, with high spots here and there in centers where the manufacture of munitions or of other material for the war is under contract. With these exceptions no change is manifest in the demand for electrical merchandise. True, there is a falling off in the sale of devices classed as luxuries, but there is also a greater demand for labor-saving appliances due to conditions in the domestic help market.

Building operations are practically at a standstill, but activities in the industrial world more than compensate for losses in that direction. In addition government work has stimulated trade in the shipbuilding and munition centers.

A gradual change for the better is apparent in the merchandising attitude of central-station companies, and the disposition is to give wider recognition to the jobber and to the contractor-dealer as economic factors in the distribution and sale of electrical goods.

A singularly pleasant feature in the general jobbing situation is that the number of jobbing firms has not increased in the East, nor has the stability of those houses engaged in the jobbing trade been one whit weakened by war conditions. As a matter of fact, taken by and large, the jobbers are quite prosperous in the East and face the future calmly and without fear. It is felt that just as in England so in this country the claim of the jobber as a legitimate and economic entity in the distribution chain will be established more firmly than ever in spite of the feeling that the middleman should be cast into the discard as an unnecessary appendage in any meritorious scheme of merchandising.

The movement for a wider adoption of trade acceptances so far has shown but indifferent results, chiefly owing to the failure to press the scheme energetically. It is recognized that the plan is still new and that un-

less it is universally adopted in the jobbing trade it possesses disadvantages especially in competitive situations where delinquents have wide latitudes in choice of payments due to the varying credit practices.

On the whole, collections are good in the Atlantic district, the government and industries working for it strange to say being slowest in settling accounts. In some sections the disposition of contractor-dealers to aspire to become jobbers as well has been noted but has caused no alarm. Hardware, department and drug stores are enlarging their sales of electrical appliances, but this widening of the avenues of distribution is not an unwelcome sign, especially when the articles are handled by those conducting business on well-recognized merchandising lines.

From reports made by a Canadian jobber conditions in Canada are by no means assuring. There is a decided decline in business and merchants are husbanding all their resources. The prosperity which Canada enjoyed in 1916 and 1917 was due to the large munition orders placed by England and with the filling of those contracts prosperity ceased. Collections are difficult to make, and while no great shrinkage in values is anticipated the outlook is anything but pleasant in that country. This, however, was the only pessimistic note sounded in the meeting.

It was estimated that the jobbers have now over 50 per cent more capital tied up in stocks than before the entry of the United States in the war.

The next meeting of the Atlantic division of the Electrical Supply Jobbers' Association will be held in Cleveland at the time of the general meeting in November.

MEETING OF THE CENTRAL DIVISION

Rising costs of conducting wholesale business in electrical supplies caused by (1) wage and salary increases, (2) higher costs of packing materials and shipping and delivery services, and (3) increasing amounts diverted to federal taxes, were discussed by the Central Division of the association on Tuesday.

Several jobbers reported that without increasing the number of their employees their payrolls had increased 15 per cent or more in amount during the past year, making with the increase of the previous year a total increase of more than 25 per cent since 1916.

Questionnaires answered by fifteen Middle West jobbers showed that their operating expenses for the first four months of 1918 compared with the same period of 1917 had increased by an average of 3.15 per cent, while their respective volumes of business for the same period had decreased 1.7 per cent. The jobbers' income and excess profit taxes paid during 1917 represented an average of 1.37 per cent of their gross sales and 23.7 per cent of their net profits, the figures reported showing extreme ranges of 4.7 per cent to 0.8 per cent and 6 per cent to 55 per cent respectively.

New England Section to Hold War Convention

A war convention without social features will be held in September or October this year by the New England Section of the National Electric Light Association at Springfield, Mass., the sessions occupying two days.

MISSOURI CONVENTION SHOWS A KEEN INTEREST IN RATES

Great Majority of Papers and Discussions Reflect
Situation Created by Increasing Costs—
Concerted Action Promised

In every sense, the convention of the Missouri Association of Public Utilities at St. Joseph, Mo., May 17 and 18, was a businesslike meeting. For the time being the central-station men of that State have ceased the discussion of the detailed problems of operation and have concentrated all thought and action on the broader and fundamental question of securing adequate net earnings. Furthermore, it is admitted that the situation in Missouri has reached a stage wherein the time for consideration of small economies that might be made in operation is past. Sweeping increases in rates are necessary to give the utilities relief. Moreover, it does not appear to the central-station executives that they are getting relief promptly enough in the present critical condition of affairs.

That the Missouri convention did have long and well-attended sessions filled with vital business discussions this year was perhaps more striking because of the contrast this convention presented to the thoroughly enjoyable convention boat trips of former years. With Hugo Wurdack of St. Louis presiding, the convention was opened by addresses from two Missouri mayors. Mayor J. C. Whitsell of St. Joseph expressed willingness to aid the local utilities in educating the public to the fact that only a small percentage of public utility company receipts are net earnings. Only a few, he said, realized that a difference exists between the money the company takes in and the net revenue. Mayor H. W. Kiel of St. Louis stated that changing conditions are making the public see the value of utility service to the city. He expressed the belief that higher rates would have to be paid for that service.

THE PRESIDENT'S ADDRESS

The address of President Bruce Cameron of St. Louis was read by Secretary F. D. Beardslee in the president's absence. The paper stated emphatically that the postponement of the convention at a time when such vital problems are to be discussed would have been a grave mistake and dealt at length on the St. Louis street railway situation. Last February the street-railway employees demanded an increase in wages. The money to pay it could not be secured from the earnings of the company on the rates of fare in effect. Application was made for increased fare, and the city of St. Louis opposed this increase before the commission. In spite of this the commission granted the increased fare and the workmen were granted increased wages. Whether the city of St. Louis will attempt to fight still further in the courts and take the responsibility of bringing on a strike of the railway employees in consequence remains to be seen. Mr. Cameron favored the skip stop as a conservation measure both for saving coal and saving time. He predicted that prices of labor and material would reach higher levels than those now in effect and pointed out that high prices would continue for a long while still, even should the war be ended. His recommendation was that changes be made to take these things into account. As one of these changes he suggested the coinage of a 7½-cent piece to take the place of the 5-cent piece, the pur-

chasing power of which is no longer sufficient to secure the formerly common 5-cent commodities.

J. S. Tritle, manager of the St. Louis office of the Westinghouse Electric & Manufacturing Company, in a paper on "How the Manufacturer Is Meeting the Problems Created by War," recited data on the increased business which his company is doing. On June 30, 1914, the company employed 11,702 men, and on Feb. 28, 1918, it had 36,534. When war broke out Aug. 1, 1914, the company had on its books unfilled orders amounting to \$8,000,000; on April 1, 1918, unfilled orders amounted to \$153,000,000, not including gun business of the New England Westinghouse Company.

PUBLIC UTILITIES' RATES AND REVENUES

The paper by H. Spochrer of St. Louis on "Taxes Affecting Public Utilities" indicated one broad and ever-widening avenue through which revenues of public utilities are taken from them. Especial attention was directed to such discriminatory taxes as the franchise tax and the gross income tax not assessed against other industries. The author named a total of twenty-one separate taxes and gave the total of each paid by the Union Electric Light & Power Company. In the aggregate these taxes amount to 12 per cent of the average price per kilowatt-hour.

Col. Philip J. Kealy of Kansas City presented a paper which was one of the most important. It sounded the keynote of the convention in the following words:

"We are here to work out plans not to reduce operating costs or to effect small economies, but plans to preserve the very existence of the industry itself. One of the principal things we now have to do is to effect that change in our own psychological attitude that we must later effect in that of the general public. We must get away from our local viewpoint with all its prejudices and face our problem as a national emergency. We must, in our own minds and in the minds of the public we serve, stamp our companies with a national character and have them considered as a vital and essential part of our war preparations."

In addition to this, the paper was a résumé of what has been accomplished nationally on this line and was an outline of what the Missouri association can do to help carry on the national movement. Not the least part of this program consisted of work to prepare the public mind for rate increases which the companies must have and which commissions are willing to grant when shown the facts.

Discussion of this paper brought out that this work of public education must be done by newspaper advertising, by personal explanation among influential citizens, and by all other available means of disseminating information. The question of how to answer the argument of the man who says a utility should not break rate contracts, even though it be losing money, also came up. Several good answers were suggested. One form of explanation was that public utility contracts are long-term contracts as compared with ordinary commercial obligations. They are based on years of experience in normal times. Now times are very abnormal. The public utilities are giving service at a loss. A contract that is being fulfilled at a loss is sure to be expensive to the party served in the long run. An inferior service will be delivered or some other trouble will develop. It is better for both parties to

readjust the contract to profitable terms. Another argument advanced was that the public did not object to breaking public utility rate contracts as long as the break was in its favor. Then, why should it object to the same procedure when the break favors the company?

THE WAR AND THE UTILITIES

The paper by H. Wurdack of St. Louis on "The Effect of War Upon Utilities" was an analysis of statistics from Moody's and Poor's manuals and of conditions as they have been observed. The author concluded from his analysis that: (1) Regulation will only be tolerated by the American people as long as it seems to work to their advantage; (2) laws and limitations made in peace times to govern peace conditions are in many cases found to be wholly inadequate, improper and inoperative in a war emergency, and (3) commissions, local authorities and communities must allow liberal and speedy remedy if total destruction of utilities is to be averted.

He also suggested as remedies that rates should be increased enough to reimburse companies for losses already sustained and enough to prevent further losses, and recommended that unnecessary capital expenditures be curtailed to the limit and some means be provided for financing necessary work at reasonable capital costs.

As a fitting culmination of these papers and this discussion on rates and revenue, the resolutions committee submitted a previously planned and carefully drawn resolution which the association, acting as a committee of the whole, will later present to the Missouri commission. The purport of resolution follows:

That all public utilities are entitled to increases in rates sufficient to cover increased costs and that new or changed schedules of rates should be allowed to take effect and should not be suspended by the commission until an adverse showing has been made to justify suspension. Furthermore, the resolution declared that all operating costs incurred by franchise requirements not essential to the maintenance of service should be discontinued for the duration of the war. The resolution was aimed particularly at the present practice of the commission of suspending all applications for increases in rates instead of permitting them to become effective by law thirty days after filing.

THE COAL PROBLEM

Gov. Wallace Crossley, Fuel Administrator for Missouri, being in the city on other business, addressed the convention extemporaneously. He predicted more serious coal troubles next winter than prevailed last winter. He expressed the opinion that the activities of the national fuel and transportation departments should be co-ordinated. In the discussion following his talk many central-station operators testified that the grade of coal now being delivered from mines was twice as high in ash as formerly and estimated that a saving of 30 per cent in coal cars could be made by compelling mines to ship clean coal. A committee is to be appointed to supply Governor Crossley with accurate data on the inferior coal service now being rendered to Missouri utilities.

M. F. Henry, secretary of the Missouri Fuel Administration, in a paper told the delegates that higher

freight rates on coal amounting to 15 cents to 50 cents a ton could probably be expected within six weeks. He also spoke of the national Fuel Administration's plan for classifying power plants in order to shut down inefficient isolated plants. The inefficient plants in Missouri, he said, will soon find their fuel supply cut off.

In the discussion the opinion was expressed that the Fuel Administration could do more good by regulating the quality of coal than by concerning itself with stopping small leaks in central-station plants.

Others who took part in the convention program were Prof. H. C. Lanier of the University of Missouri and J. A. Whitlow, engineer with the Missouri Public Service Commission.

Mr. Whitlow declared the commission had been requiring extensive publicity on the details of all rate increases granted before entering a decision, in order to maintain favorable public relations for the companies. Concerning rates of return, he said there were some good reasons why higher returns should be granted now. With the small electric utilities—that is, those in towns of 1000 or less—he said operating costs are now 18 cents to 20 cents per kilowatt-hour. He predicted that some of these will have to be shut down for the period of the war, as they could not sell their product at a price which would even sustain the property.

ELECTION OF OFFICERS

Officers elected for the ensuing year are: President, J. H. Van Brunt, St. Joseph; first vice-president, J. M. Scott, Kansas City; second vice-president, L. P. Andrews, Sedalia; third vice-president, H. Spoehrer, St. Louis, and secretary-treasurer, F. D. Beardslee, St. Louis. The executive committee is composed of P. J. Kealy, Kansas City, and B. C. Adams, Joplin, and the public affairs committee comprises V. L. Elbert, St. Joseph; J. F. Porter, Kansas City; Bruce Cameron, St. Louis, and E. C. Deal, Springfield.

How Electric Energy Helps to Conserve Wheat

Electricity helps conserve wheat. The new building in the middle of the picture is a 7000-kw. substation at the Cedar Rapids mill of the Quaker Oats Company, which receives power from the Iowa Railway & Light Company. Electricity here turns the wheels of what is said to be the largest cereal mill in the world, and produces more than 1,000,000 wheatless breakfasts daily.

Women Employees Are Helping Too

These employees of the New York Edison Company, Bronx district, took part in the third Liberty loan parade and are actively working for the Red Cross and a performance of "Fancy Free" to be given on the evening of May 28 at the Casino Theater, the entire proceeds of which will go to the Red Cross auxiliary of the New York lighting companies.

SOUTH DAKOTA ASSOCIATION MEETING AT SIOUX CITY

Discussion on the Electric Range as an Agency for
Fuel Conservation Brings Out
Interesting Points

The second annual convention of the South Dakota Electric Power Association was held at the Carpenter Hotel, Sioux Falls, on May 15 and 16. An address of welcome was made by R. D. Springer, secretary of the Sioux Falls Commercial Club.

H. F. Brownell, president of the Sioux Falls Rotary Club, gave a paper on "Service," in which he pointed out that in every business it should be the aim to render service to the purchaser. "Service" was defined as that part of the commodity which is not paid for but which must be rendered in order to build up a successful business.

In his paper on "Electric Ranges and Ovens," H. Hamilton Jones of the Hughes Division of the Edison Electric Appliance Company pointed out that it is the patriotic duty of every central-station manager to push the sale of electric ranges and ovens as a means of conserving the coal and meat supply and thus helping to win the war.

The following important facts were brought out by the discussion: A rate of 4 cents or $4\frac{1}{2}$ cents per kilowatt-hour is not a prohibitive rate. The station peak is not materially increased by the installation of electric ranges. An effort should be made to place the first ranges in a town in the homes of people of moderate means where the mistress uses the range herself, rather than in homes of the wealthier people where a maid does the cooking. The big disadvantage of the electric range is the cost of heating water.

The "Question Box" brought about the discussion of the following subjects: The necessity for increasing rates, especially in the smaller steam plants; transmission-line problems—use of iron wire, lightning troubles,

farmer consumers; the advisability of trying to get a public utility law passed.

The time and place of the next convention were left for the executive committee to decide. The following officers were elected: President, A. H. Savage, Flan-dreau; first vice-president, E. J. Sherwood, Mitchell; second vice-president, L. V. Schneider, Salem; secretary-treasurer, O. J. Gronsdaahl, Hartford; executive committee, W. C. Blanchard of Aberdeen, F. D. Brown of Huron and N. C. Draper of Sioux Falls.

PROGRAM ARRANGED FOR THE N. E. L. A. CONVENTION

Tentative Outline of Business for the War Meeting
Which Is to Be Held at Atlantic City, N. J.,
on June 13 and 14

The tentative program for the convention of the National Electric Light Association at Atlantic City on June 13 and 14 follows:

Thursday Morning, June 13—Presidential address; reports of secretary, treasurer, membership committee; reports Commercial, Technical, Accounting and Electric Vehicle Sections; new business.

Thursday Afternoon—Report of National Committee on Gas and Electric Service; report of committee on public utility conditions—war financing of utilities, rate increase activities, etc.; report of public policy committee; discussion of central-station aspects of the labor problem; female employment; meter reading and testing; economized accounting.

Thursday Evening—Patriotic addresses on the broader national topics of immediate importance to the industry, by distinguished speakers (details in the hands of the president).

Friday Morning, June 14—Address and general discussion on the coal situation; important war-time topics introduced by the Technical and Hydroelectric Section.

Friday Afternoon—Important war-time topics introduced by the Commercial, Accounting and Electric Vehicle Sections.

Friday Evening—Round-table discussions and films of war activities of special interest to member companies, with other appropriate features.

A circular letter issued to members by Secretary T. C. Martin displays prominently the announcement that "no ladies are expected in attendance, and there will be no provision for entertainment."

The hotel reservations are in the hands of Frank W. Smith of the convention committee. It is confidently expected that ample accommodations for all delegates in attendance will be provided at the Traymore, where the convention will be held. Hotel reservations should be made immediately through the hotel committee, addressed to Mr. Smith, 130 East Fifteenth Street, New York. The committee will be glad to provide any detailed information required and will promptly advise the delegates as to the reservations. Those desiring to secure accommodations at other hotels will have their wants promptly cared for by the committee, on application, which should also be addressed to Mr. Smith. Should such information be required, the official circular of the Atlantic City Hotel Men's Association, listing some forty hotels, will be sent on request.

As soon as definite information from the membership is in the hands of the convention committee steps will be taken by it to insure as far as possible a sufficiency of parlor-car accommodation from New York and Philadelphia and homeward.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

New York Jovian League.—At a luncheon on May 15 Frank Dixon, Red Cross Commissioner to France, talked on "My Personal Experiences in France" before the New York Jovian League. On June 15 the league will hold its summer rejuvenation at the Hotel Shelburne, Brighton Beach, N. Y.

Electrical Club of Detroit.—Dr. E. J. O'Brien, who recently returned from active service in France to Base Hospital No. 17, talked before the Electrical Club of Detroit at the regular luncheon of May 11. William S. Gilbreath, secretary and manager Detroit Automobile Club, addressed the Electrical Club on May 18.

Iowa Association of Electrical Contractors and Dealers.—At the annual meeting of the Iowa Association of Electrical Contractors and Dealers J. E. Sweeney of Waterloo was elected state chairman, and J. N. Holoway of Mason City was elected treasurer. This meeting was held at Fort Dodge on April 30 and 31.

A. I. E. E., Schenectady Section.—Prof. Comfort A. Adams, president of the A. I. E. E. and professor of electrical engineering at the Massachusetts Institute of Technology, was the main speaker at the annual meeting and dinner of the Schenectady Section of the American Institute of Electrical Engineers on May 24.

N. E. L. A., Philadelphia Company Section.—William K. Kerford was elected chairman of the Philadelphia Electric Company Section of the National Electric Light Association at a meeting on May 15. Major William M. L. Coplin, director of Base Hospital No. 38, spoke on "From the Trench to the Base Hospital."

Massachusetts State Association of Contractors and Dealers.—On May 9 the Worcester district of the Massachusetts State Association of Electrical Contractors and Dealers transferred its meeting place from Worcester to Fitchburg. Representatives of the Westinghouse Electric & Manufacturing Company and the Worcester Electric Light Company were present and addressed the meeting.

Electrical League of Cleveland.—The Electrical League of Cleveland participated in the big Red Cross parade held on May 18. On May 20 mobilization was completed for organization of the league in the competition for the "victory chest" to be donated to the organization securing the largest amount of subscriptions for the Red Cross in Cleveland. Lieut. John H. Clark spoke to the league on navy expansion on May 9.

New York Electrical Society.—The three hundred and sixty-fifth meeting of the New York Electrical Society was held on May 23. V. T. Goggin gave an illustrated lecture on how Camp Devens was constructed.

N. E. L. A., Brooklyn Company Section.—On May 7 A. E. Muenich presented a paper entitled "Street-Lighting Engineering and Construction" before the Brooklyn Company Section of the National Electric Light Association.

Jovian Electric League, Los Angeles.—At the May 15 meeting of this league H. Hinkovic, a former member of the Croatian Parliament and member of the Yugoslav committee of London, spoke on the subject of European politics and racial differences.

I. E. S., New England Section.—At the last meeting of the season of the New England Section of the Illuminating Engineering Society Edmund Leigh, chief of plant protection, Military Intelligence Bureau, Washington, D. C., delivered a talk on "Plant Protection," and M. Luckiesh of Nela Park, Cleveland, Ohio, talked on "Timely Aspects of Lighting." This meeting was held on May 21.

The Engineering Foundation.—A special meeting of the Engineering Foundation will be held on May 28 at 8.30 p. m., in the auditorium of the Engineering Societies Building in New York. Dr. George E. Hale will address the meeting on the "National Research Council." The foundation is composed of representatives of the national societies of Civil, Mining, Mechanical and Electrical Engineers.

Association of Iron and Steel Electrical Engineers.—Two hundred and nineteen members of the Cleveland, Youngstown and Pittsburgh sections of the Association of Iron and Steel Electrical Engineers inspected the Ohio and McDonald plants of the Carnegie Steel Company on May 18. The two bar mills of the latter plant recently put into operation were viewed. B. W. Gilson, chief electrical engineer of the Carnegie Steel Company and vice-president of the association, was host to the big delegation of visitors. The meeting concluded with a dinner at the Ohio Hotel in the evening and a discussion of the day's trip through the local mills.

Western Society of Engineers of Chicago.—Preparation by American engineers for leadership in the coming industrial development of Russia is urged by the Russian Society of Engineers of Chicago. A series of lectures by Russian and American engineers on the industrial needs of Russia and the mutual benefits to be derived by commercial intercourse is being arranged for all Chicago engineers by the Western Society of Engineers. The first meeting was scheduled to be held at the rooms of the Western Society of Engineers, Chicago, on May 22, with addresses by William J. H. Strong, consulting engineer, on the industrial development of America and similar possibilities in Russia, and by W. W. De Berard, Western editor *Engineering News-Record*, on publicity.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Sale of Municipal Plant Administrative Action.—Mandamus will not lie to compel the mayor of a city to file referendum petitions and call an election thereon for the purpose of referring to the people of said city the action of the city council in ordering a sale of its electric light plant pursuant to the Revised Laws 1910, 541, giving the city the right to dispose of its real property, as such action involves administrative discretion and is not within the referendum powers reserved to the people of municipalities, the Supreme Court of Oklahoma held (170 P. 1165).

Utility Cannot Contract to Release Itself Arbitrarily from Contracts.—A corporation assuming the performance of a public duty to domestic consumers, as the furnishing of electricity for light, may make and enforce reasonable rules and regulations for the conduct of its business, but it cannot compel its patrons to enter into contracts releasing it from its obligations when and as it may arbitrarily elect, but must to extent of their needs and within the limits of facilities serve alike those accessible thereto who apply therefor and submit to such rules and regulations, according to the Supreme Court of Appeals of West Virginia in *Chambers vs. Spruce Lighting Company* (95 S.E. 192).

Injunction to Step Further Progress of Municipal Project Diverting Water.—The riparian rights of a power company, consisting of a small parcel of land extending to high-water mark below a dam and reservoir constructed by a city for water-supply purposes, a contract with a riparian owner below the dam for a portion of the riverbed with a right to regulate flowage, and options for other lands and rights, all of which were apparently acquired after the city's water development was practically completed, did not entitle such company to relief by injunction against the further construction of the dam and reservoir and the diversion of water, the United States Supreme Court held (38 S.C.R. 245). If a city's development of the water of a river for a water supply was unauthorized, its act in damming the river and diverting the water was that of an ordinary wrongdoer, and a power company owning riparian lands and rights and which had adopted a plan of development had only the usual remedy for a tort by an action at law for damages unless exceptional circumstances rendered resort to a court of equity appropriate, which was not the case where the company could not for the present be injured and might never be substantially affected by the diversion of the water.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Saving Energy at Cleveland.—On the new bridge across the Cuyahoga River at Superior Avenue, Cleveland, 100 of the 1500-cp. lamps are to be replaced by 1000-cp. lamps in order to conserve energy.

First Coal Over Government Railroad in Alaska.—The first commercial shipment of coal from the mine operated by the Alaskan Engineering Commission was made in the last week of April. A consignment of 100 tons from the Chickaloon field went to Seattle, Wash., on the steamship Alameda. The coal was shipped in sacks under a freight rate of \$5 per ton for shipments of 100 tons or more and \$7.50 per ton on shipments less than 100 tons.

Power Survey at Denver.—The electrical bureau of the Civic and Commercial Association of Denver is making a complete survey of all the power plants in the city with the idea of effecting fuel economy. A dozen enumerators employed by the bureau are engaged in obtaining data concerning all plants rated at more than 5 hp. The next step planned by the bureau is to offer free engineering advice to the proprietor of each power plant, in the interest of saving power or fuel.

Daylight Saving Reduces Revenue.—The San Joaquin Light & Power Company has applied to the California Railroad Commission for an increase in rates, testifying in support of the claim that the daylight-saving law will reduce its revenue \$50,993 for the year. The company asks a rate increase so that it may earn 8 per cent on its investment. Owing to water shortage and fuel prices the company claims that its fuel cost this year will be far in excess of last year's costs.

Training School for Replacement Troops of Engineer Corps.—The government is to establish immediately at Camp Humphreys, Va., a training school for replacement troops of the Engineer Corps. These men will have intensive training to fit them for special service in connection with the engineer units in the service. There will be a complete school, in which all the trades identified with the engineer units of the army will be taught by means of short intensive courses. As this school will have room ultimately for approximately 30,000 men, many instructors will be required, and an appeal is made to qualified men beyond the draft age to enlist in the Engineer Corps as instructors. A thorough knowledge of the trades followed by machinists, blacksmiths, wheelwrights, carpenters, concrete foremen, electricians, dynamo experts, miners, painters, riggers, sheet-metal workers,

foundrymen, automobile and motor truck makers, gas-engine men, draftsmen, photographers and foremen of construction is required, and the applicant must furnish credentials showing knowledge of one of these lines. Full particulars and application blanks will be furnished by Captain Louis T. Grant, E. R. C., secretary Engineer Training Schools, Camp Humphreys, Va.

Study of Bituminous Coal Storage.—The engineering experiment station of the University of Illinois has just completed a study of the problems involved in coal storage and has published the results in a 200-page illustrated book designated as Circular No. 6, "Storage of Bituminous Coal." The study was made under the direction of H. H. Stoeck, professor of mining engineering. The reasons and advantages of storing coal are given, the kinds and sizes of coal which may be safely stored are described, and the many factors entering into successful storage are discussed. Copies of Circular No. 6 may be had by addressing the engineering experiment station at Urbana, Ill. The price is 40 cents per copy.

Thrift and Economy a Duty.—The Council of National Defense and the advisory commission to the council believe that a concerted effort for economy by the people of the nation will not only go far toward paying America's expenses in the war, but will also reduce consumption of raw and manufactured materials essential to the conduct of the war. The council urges all to refrain from unnecessary expenditure of every kind and to bear constantly in mind that only one thing is now of real importance, and that is the winning of the war. This war is more than a conflict between armies; it is a contest in which every man, woman and child can and should render assistance. Thrift and economy are not only a patriotic privilege but also a duty, the council adds.

Rate Case in Columbus, Ohio.—To decide a dispute between the city of Columbus and the Columbus Railway, Power & Light Company as to the justice of a rate for domestic lighting fixed by the City Council, Ohio Public Utilities Commission engineers have made an appraisal of the property used for light and power service. It was figured that the reproductive value is \$6,240,046, as compared with \$7,105,808, the valuation found by company appraisers. Present value is given as \$5,725,963. It is said that the city will endeavor to secure a reduction in the valuation. The ordinance rate was placed at 5 cents on Dec. 27, 1915. The company contended that this was too low and appealed to the commission. The city then asked appraisal. A hearing will be held by the commission later. For some time the company has been endeavoring to secure an amendment to its franchise which would allow an increase in the street-railway fare. The council refused the request for this change, and since then the company has been employing publicity to urge the necessity for proper compensation as a relief from war conditions.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Free Service.—In deciding a complaint of the town of Sigel against the Central Illinois Public Service Company, the Illinois Public Utilities Commission says that where the terms of a franchise ordinance granted subsequent to the enactment of the utilities act provided in good faith that the town should receive the same free service as surrounding communities the commission, expressly denying establishment of a precedent, authorized the utility to continue rendering free service in compliance with the terms of such ordinance.

Direct-Current Service.—Acting on a petition of the Monmouth Public Service Company, the Illinois Public Utilities Commission has decided to approve rates for direct-current electric power service approximately 10 per cent higher than charges for alternating-current power service. The commission would not consider the question of discontinuance of service on a petition to increase rates for such service. A rate schedule for direct-current power service will not be approved, the commission held, where it appears that the schedule is intended to make the rates intolerably high for the purpose of forcing its discontinuance.

Bond Sale Authorized in California.—The California Railroad Commission has issued an order authorizing the Sierra & San Francisco Power Company to issue \$1,000,000 of its first mortgage 5 per cent forty-year gold bonds, payable Aug. 1, 1949. The order of the commission permits the company to sell the bonds at not less than 80 per cent of their face value plus accrued interest, and provides that the bonds shall be used by the company to reimburse its treasury in part for capital moneys expended for improvements prior to Feb. 8, 1918. After such reimbursement, all funds obtained through the issue of the bonds shall be expended only for such purposes as the commission may authorize in a supplemental order or orders. In its decision the commission suggests that the company proceed with the construction of substations, distribution lines and other improvements estimated by the company to cost \$197,344.31. The commission further recommends that the company expend approximately \$150,000 for the construction of a third penstock to its existing Stanislaus plant and \$450,000 for the installation of a 5000-kw. unit at its so-called Upper Stanislaus plant. It is estimated that the installation of the third penstock will increase the company's generating capacity by 3200 kw., while the expenditure of \$450,000 on the upper Stanislaus plant will add 5000 kw.

Henry L. Doherty was recently given the degree of doctor of laws at the commencement of Lincoln Memorial University at Cumberland Gap, Tenn.

E. L. Munger, who has been superintendent of the Gloucester (Mass.) Electric Company for the last twenty-three years, has been promoted to the position of general manager of the company.

George E. Haggas has been appointed assistant to the general manager of the Cumberland County Power & Light Company, Portland, Me. Mr. Haggas has been connected with the company since 1915, when he was engaged to do valuation work in the engineering department. He is a graduate of the University of Michigan.

J. I. Banash, for eleven years actively engaged as engineer at the Underwriters' Laboratories, Inc., in the examination and testing of hazardous appliances, has been appointed engineer-in-charge of the casualty department. He succeeds S. V. James, who is now mechanical engineer on special research work at the laboratories.

John D. Ball, professor of electrical engineering at the School of Engineering of Milwaukee, has been appointed dean of the school to succeed Prof. William Baum, resigned. Professor Ball was a graduate of the University of Illinois and went to the School of Engineering about a year ago from the General Electric Company, with which he had been connected for about ten years.

W. Irving Mellen, commercial manager of the New England Telephone & Telegraph Company, Pittsfield, Mass., has resigned to become sales manager of the Pittsfield Electric Company June 1, succeeding H. W. Derry. Mr. Mellen has been in the employ of the New England company for about eighteen years, seven of which were spent at Springfield, Mass., and eleven at Pittsfield.

William Baum, who has been dean of the School of Engineering of Milwaukee for the last two years, has resigned to become research engineer for the Milwaukee Electric Railway & Light Company, which office has been newly created. Prior to his educational work, Professor Baum was connected with the General Electric Company for fourteen years, during three years of which he was the company's foreign representative.

Robert L. Brunet, for the last five years public service engineer of the city of Providence, R. I., has resigned to become industrial and efficiency engineer of the Jenckes Spinning Company, Pawtucket, R. I. He expects to leave his present post June 15. Mr. Brunet was formerly power engineer of the Essex Division, Public Service Corporation of New Jersey, and earlier was in the employ of the General Electric Company at Schenectady, N. Y. In his work at Providence Mr. Brunet has ably represented the city in connection with public utility rate changes, service standards and various franchise and operating matters.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Obituary

Prof. F. R. Hutton, past-president of the American Society of Mechanical Engineers, died on May 14 at the age of sixty-five years. Professor Hutton was graduated from the School of Mines, Columbia University, 1876. A year later he was appointed instructor in mechanical engineering as an associate of the late Prof. W. P. Trowbridge. He entered the faculty as adjunct professor in 1881 and became professor in 1890. Upon the death of Professor Trowbridge in 1892 the chair of engineering which he occupied was divided, and professorships in civil engineering and electrical engineering were added to

F. R. HUTTON

the already existing professorships of mining and mechanical engineering. Professor Hutton was made head of the mechanical department. He continued to direct this department until his resignation, July 1, 1907. At this time he resigned and was elected professor emeritus. For six years during his professorship he was dean of the faculty of applied science. Columbia conferred upon Professor Hutton in 1882 the degree of Ph.D. and in 1904 the degree of Sc.D. He became secretary of the American Society of Mechanical Engineers in 1883, three years after its organization. Professor Hutton was the member appointed by the society to the conference and building committee of the United Engineering Society. This committee was organized to plan the new Engineering Societies Building at 29 West Thirty-ninth Street. Professor Hutton was also one of the board of trustees which is the holding corporation for the United Engineering Society. He declined re-election to the

office of secretary in January, 1906, and at the annual meeting in the following December was unanimously elected president. In addition to these activities he was a contributor to scientific literature. His most important books, which have received considerable acceptance in the educational field in the United States and in England, are "The Mechanical Engineering of Power Plants" (in later editions, "The Mechanical Engineering of Steam Power Plants"), "Heat and Heat Engines" and "The Gas Engine." He did considerable editorial work as associate editor of Johnson's Encyclopedia, as one of the editors of scientific and engineering titles for the Century Dictionary, as departmental editor of the *Engineering Magazine*, and as a contributor to technical journals and a lecturer to scientific and popular audiences in New York and elsewhere. At the close of Professor Hutton's administration as president he was appointed by the council to the office of honorary secretary.

Samuel D. Binkowitz, Chicago manager of the Illinois Wire & Cable Company, died at his home on April 25.

F. E. Getts, manager of the Electrical Engineers' Equipment Company, Chicago, died recently at Los Angeles, Cal.

Duncan H. Graff of the sales department of the American Carbon & Battery Works, East St. Louis, Ill., died on May 7.

Charles S. Powell, an electrical engineer, died at his home, Cleveland, Ohio, on May 11. Mr. Powell was for some years Cleveland representative of the Westinghouse Electric & Manufacturing Company. In 1902 he was sent to London, where he assisted in establishing a branch office of the company. A few years ago he returned to Cleveland and engaged in the electrical engineering profession.

Winfield Scott Chaplin, a noted teacher of technology, died recently at the age of nearly seventy years. Mr. Chaplin was a graduate of West Point, but he served in the army only a short time. In 1873 he was appointed professor of mechanical engineering in Maine State College and four years later became professor of engineering in the Imperial University of Japan, where he remained until 1882. On his return to America in 1883 he took a chair at Union College, and in 1886 he went to Harvard University, where for five years he served in the double capacity of professor of engineering and dean of the Lawrence Scientific School. In 1891 he became chancellor of Washington University, where he remained until 1907, when he retired from active work. Professor Chaplin won a wide recognition for his educational work, and among the distinctions which he received was the degree of doctor of laws, conferred on him by Harvard University, that of doctor of technology, by the University of Japan, and the Order of the Rising Sun, by the Emperor of Japan. He had a wide affiliation with technical societies.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

PORTABLE ELECTRIC TOOLS OFFER JOBBERS MORE PROFIT

Grinders, Drills and Similar Articles Can Be Sold by
Present Force to Trade Already Called On, with
Resulting Profit to Jobber and Manufacturer

In an analysis of their relations with their distributors, manufacturers of portable electric tools may be divided into two classes, namely, those who have their own complete sales force and those who sell through agents. Generally speaking, those who have their own sales force are concerns whose primary business is pneumatic rather than electric tools. The development of electric tools followed pneumatic tools, and the new line was simply dumped on the old sales force with orders to "go to it." Those who do distribute through their own sales force claim to do so for the advantage it gives them of keeping the entire business in their own hands. This group in the industry, however, is not strongly sold on its own plan. Were it not for the fact that they are loaded up for months ahead with war business, they would listen now to a plan for changing and broadening their lines of distribution. Some of them are thinking very strongly about it even now.

Of the group which is selling through agents not many are taking advantage of the established lines of distribution within the electric trade. They are not using the electrical jobber with his large sales forces in daily touch with the important industrial plants of the nation. One reason for this is that there was an easily reachable and perfectly legitimate channel through which a certain volume of business could be built in the existing machine-tool sales field. Machine-tool dealers in this field were prepared to handle portable electric tools and to sell some of them. The manufacturers have therefore gone after business through these dealers with some success. On the other hand, the electrical jobber was not found to be in a particularly receptive mood by the manufacturer of portable electric tools, because to induce him to take up a new line he must be imbued with the idea that his men could handle it at a profit. None the less, the jobber can be reached, in some instances has been reached, by certain manufacturers, as is indicated by the following testimony from a manufacturer of portable grinders. He said: "Electrical jobbers should be selling our grinders for several reasons:

- "1. There is a good big percentage of profit in each sale made.
- "2. There is a good demand for these tools among industrial plants, navy yards, arsenals, etc.
- "3. The grinders are absolutely reliable and when sold stay sold.
- "4. The tools are light and portable, and jobbers' salesmen calling on industrial plants can very readily carry the grinders with them, demonstrating them to the prospective buyer right in his own plant. The salesmen already have entree to these plants.
- "5. The product gives jobbers' salesmen an opportunity to call on purchasing agents, master mechanics, etc., presenting something new to them and also putting before these men equipment that will mean more efficient production in their various departments.

"Where jobbers have really become interested in the sale of our grinders they have been able to do a very satisfactory business with them.

"After seeing how readily the grinders could be sold, a Hartford jobber instructed his men to push them, with the result that in three months following they had sold 109 grinders. What they have been able to do other electrical jobbers should be able to do."

That many incidents like this one in the grinder field have not been reported from the portable-drill and other small tool fields is probably due to a lack of appreciation of the mutual advantage these two groups could be to each other. The great advantage to the manufacturer would be better distribution. Broader distribution would mean to him not only more stable business but greater volume and a faster turnover. For the jobber the advantage would be more profit. His sales forces are calling on industrial plants to sell supplies as it is, and might just as well introduce a few portable tools. These carry an increased margin of profit that will act to raise the total gross profit on industrial business without increasing the sales expense. With a profit of from \$20 to \$50 per tool for the jobber, every sale is worth while. It seems probable that the enterprising jobbers looking for lines to sustain the business already impaired by lack of domestic building activities will investigate this line more closely in the near future.

INCANDESCENT-LAMP FACTORIES ARE ACCUMULATING STOCK

Buyers Are Being Urged to Estimate Fall and
Winter Needs—Shortage in Supply
Is Not Unlikely

Just how much the observance of the so-called daylight saving law is affecting the sale of incandescent lamps has not been determined. Experts are making estimates and, roughly speaking, it is believed that from 5,000,000 to 10,000,000 fewer lamps a year will be sold. With an annual production of about 210,000,000 lamps, these figures, in comparison, may not look formidable; but, nevertheless, they constitute quite an item. The demand for lamps has fallen off, as it always does, with the lengthening days and approach of summer.

Manufacturers now say they are accumulating a good stock in all their plants in nearly every size. The production of miniature lamps, which ran behind alarmingly during last fall and winter, while still not normal, is being much increased. The floodlamp situation, at one time acute, is improving. The stock of standard sizes for electric railway cars is in good shape. Some factories admit that on account of extra buying pressure locally certain sizes are still short, but they say that conditions are bettering.

The government's initial orders for cantonments, hospital and naval bases, war ships and munition plants, particularly in the East, have been about filled. This drain has caused a shortage everywhere. Heavy renewal requisitions, however, are expected, and for these the producers are to a great extent well prepared.

What the manufacturers, some of whom are launching an educational campaign on the subject, desire the trade to understand is that within the next few weeks—no later than June, they say—buyers should give earnest attention to placing orders for their fall and winter requirements. This is because war conditions are radically different in every aspect from normal times. The traffic situation will be more congested, and another shortage similar to that of last fall may occur. The productive capacity of the plants has not been lessened, and the output is directed to strengthening district stocks. Deliveries are interfered with by embargoes, but are improving. Labor is also uncertain, which has a tendency to lessen production. Orders for lamps of unusual design or construction are given short shrift. This policy is followed to prevent any curtailment in the output of regular lines.

JOBBER STOCK PROBLEM OF THE COMING MONTHS

More Frequent Ordering than in the Past May
Become the Rule Owing to the General
Delivery Situation

In the coming months more judgment will be needed by jobbers in placing stock orders than ever before. While there are price increases every now and then, generally speaking they are not large. In fact, for some months the price of electrical staples on the whole has been remarkably steady for these times. There is every indication, therefore, that so far as electrical supplies are concerned the peak has virtually been reached.

While there is no immediate prospect of a decline, the natural sequence to a prolonged advance in price is lower prices. There is no such thing as missing that phase. The far-sighted men are, however, making careful effort to minimize its effect.

Certainly this is not the time to speculate. There are too many elements in favor of more conservative action. On the other hand, this is no time for a jobber to let his stock run low. The government and other buyers need the jobber and his stock. Therefore stock must be kept full regardless of the prevailing price. Over-stocks must be avoided not only because of the speculative troubles but because too much stock should not be tied up indefinitely in an inactive condition when others are clamoring for these goods.

While, of course, the value of purchasing in large quantities must not be lost sight of or underrated, nevertheless it must also be borne in mind that the most important factor at present is not price but delivery. Consequently it is not improbable that the policy of more frequent ordering to replenish stock will become more general. A string of orders would seem to present a greater chance of delivery of some material, an order here and there, than a smaller number of orders each of larger size.

METAL MARKET SITUATION

Government's Attitude Toward Increase in Price of
Copper Not Disclosed—Tin Short

Whether the copper producers and refiners have abandoned their attitude toward an increase in the government price of the metal has not been disclosed. On June 1 the present figure of 23.50 cents a pound expires by limitation. The so-called "insiders" are not talking for publication, and covered wire and cable manufacturers no longer speak of an increase in the price of their products.

No arrangements have been effected for the equitable distribution of tin as between war material demands and commercial uses. The metal is decidedly short and prices nominal, but ruling high. The War Industries Board has commandeered all stocks of platinum, allowing \$105 per Troy ounce on purchases. Fluctuations in the quotations on old metals are negligible.

THE WEEK IN TRADE

GOVERNMENTAL orders for electrical equipment, accessories and supplies of every description are making the highest sales records in the history of the trade. Manufacturers, jobbers and dealers are participating in current prosperous conditions, according to their capacity and facilities.

An increased demand is reported for small and medium-size motors, with stocks lower. Storage batteries are selling rapidly, with the supply diminishing. Domestic appliances are having a sale far above that of last year. Conduit of all sizes is scarce in the East and South but in a better position in the Far West. A shortage of labor is said to be affecting many lines of electrical manufacturing. Deliveries have been more prompt in some sections, especially in the Middle West and Northwest. But along the Atlantic seaboard freight embargoes are yet restricting trade.

Collections are reported better—fair to prompt. Credits are being limited on outstanding accounts for special reasons.

NEW YORK

Outside of government orders trade with jobbers, distributors, producers and dealers is referred to as quite satisfactory. The sale of electrical goods and equipment is on a much larger scale than a year ago; in fact, some jobbers state that their business has more than doubled. One well-known manufacturing jobber, in a formal financial statement, reports sales for the four months ended April 30 of nearly \$1,750,000. The concern's gross business in 1917 was \$5,234,323.

As yet no concern is expressed relative to the future supply of staples. A curtailment in production is guardedly mentioned, but no predictions are being made or speculations advanced. Further developments are awaited.

Financially the trade position is sound, conservative methods and tactics being the rule. Collections have strengthened.

CROSS-ARMS.—Stocks in the East are the lowest on record. In certain sizes none are to be had, and substitutes are being considered.

PORCELAIN INSULATORS.—On low-tension insulators, from 5000 volts to 6600 volts, deliveries are better. On high-tension insulators, from 32,000 volts to 33,000 volts, shipments are running behind. Prices are unchanged.

POLES.—The government is taking over chestnut-pole stocks. Cedar is commanding a better price. For poles on stump an advance of from 5 to 10 per cent was made during the past six weeks.

HOUSEHOLD SPECIALTIES.—In heating appliances, especially tableware, the supply is fair. Shipments are coming through subject to embargoes, with deliveries back two months on several Western lines. There is a possibility of the price of washing machines being revised on account of the recent advance of 10 per cent on galvanized material.

COLLECTIONS AND CREDITS.—Generally collections have improved, and in many instances they are prompt.

POLE MATERIAL.—With the government's extraordinary steel requirements the supply and price of pole hardware is sure to be affected, to express the views of one large distributor. The lack of necessary priority orders is interfering with shipments.

SCHEDULE MATERIAL.—A leading manufacturer on Saturday last announced a lowering of jobbers' discount from 40 to 35 per cent on his entire line.

RUBBER SPECIALTIES.—Producers of rubber electrical specialties have made no announcement as yet since the

government took control of crude-rubber prices, fixing them at from 62 cents to 68 cents a lb.

CONDUIT.—No improvement is reported concerning conduit. The supply continues far from satisfactory, orders of importance being filled on the allotment basis. A couple of cars came in this week because of the temporary lifting of embargoes.

CHICAGO

Electrical contracting activities continue to show a satisfactory increase over the previous week. During the week ended May 8 there were issued 752 electrical permits, aggregating 10,667 incandescent lamps and 1621 hp. Compared with the previous week's figures this shows an increase of 14 per cent in the number of jobs—44 per cent in light capacity contracted for and 23 per cent in power capacity. During the same week a year ago there were issued 836 permits, showing a decrease for this year of only 10 per cent. Building operations have fallen off again. For the week ended May 8 there were issued seventy-three building permits, involving construction work to the amount of \$752,900. This is considerably less than the business done the previous week. Comparisons with the previous week's figures show a decrease of 31 per cent in the number of jobs and 16 per cent in the volume of business. For the same period last year there were issued 122 permits, involving \$1,405,200, showing a decrease for this year of 40 per cent and 46 per cent respectively.

RECTIFIERS.—There is quite a demand for small rectifiers for charging batteries at present. One local company finds it difficult to fill its orders, not because of lack of material but from shortage of labor.

LAMPS.—The demand for portable lamps, especially of the reedware type, is very good at present, and deliveries are fair.

CONTROLLING DEVICES.—Several manufacturers in this territory are behind in their orders, owing to the filling of government work. They state that they could fill these orders in better shape if it were not for the difficulty in getting labor for their plants.

INSTRUMENTS.—A large instrument maker in this locality reports large orders for instruments with deliveries fair. The labor situation in this work is bad.

CABLE.—The Kansas City Light & Power Company has just purchased a large order of underground cable.

LARGE TURBINES.—An Iona company is soon to place an order for a 20,000-kw. unit.

FANS.—Electric fans are beginning to move in the states of Oklahoma, Arkansas and Missouri. A short and severe hot spell caused all dealers through this territory to put in fan windows.

MOTORS.—Flour mills are reported to be heavy purchasers of motors at this season.

INCANDESCENT LAMPS.—Stocks are reported to be getting in somewhat better shape in this territory.

BOSTON

The electrical trade in New England now reflects little but war conditions, and every week it seems that ordinary industrial activities grow less important. Business is running at a very high tide, and the extent to which government requirements influence commerce is beyond any previous experience. Despite the heavy calls upon the jobbers and manufacturers entailed by war production plants, stocks are still in pretty fair shape, though railroad congestion hampers refilling in many lines. Collections rule somewhat better than during the late winter, but in order to maintain them satisfactorily the credit departments are obliged to work harder than normally is the case.

Prices are firm this week, with little prospect of softening for the present. Deliveries do not show the desired improvement, although previous shortages are being made up in lamps. The coal situation is very disquieting, and conservation is being urged against the apprehended repetition

of last winter's famine conditions. Labor is restive in the electric railway field and central-station linemen show some dissatisfaction with wages and working conditions. The outlook is excellent for legislation looking toward the financial betterment of electric railways and their re-entrance into the electrical supply market on a broad scale.

INDUSTRIAL ELECTRIC TRUCKS.—The demand for war service plant applications is remarkably active, and the difficulties of making prompt deliveries are the chief obstacle to a record-breaking business. Prices remain fairly steady.

MOTORS.—A recent increased demand for motors of ½-hp. and 1-hp. rating is noted, especially for pumping service on large private estates. The shortage of steel for tanks hampers this business somewhat. Motor stocks, especially in smaller sizes, are temporarily lower and the larger sizes are still obtainable only upon relatively long shipments. The opinion is heard that present prices will stand for some time.

FARM LIGHTING SETS.—These are in good demand, with improved road conditions and liberal advertising. The practice of selling some of the best outfits with the batteries initially charged and the wiring ready for immediate service with minor adjustments is proving a help in increasing sales.

STORAGE BATTERIES.—Government demands are so great that the ordinary user is having some difficulty in securing this class of equipment promptly. Stocks are getting low, and plenty of batteries already sold are now on the railroads en route to distributing points.

AUTOMOBILE ACCESSORIES.—The demand is substantial, especially for cars undergoing rebuilding. The trade in charging sets is below normal just now.

FLOODLAMPS.—A fair volume of business is being handled in New England, but manufacturers report a larger amount of business in other parts of the country.

REFLECTORS.—Business is quiet in street-lighting equipment, but very active in products suited to cantonment, navy yard and shipyard service. No recent or prospective price changes are in evidence.

MOTOR CONTROLLERS.—Equipments to fit the requirements of small-motor duty are in demand, especially in shoe factory and pumping service. Stocks are in reasonably good condition, and shipments and deliveries are understood to be well ahead of the game in comparison with motors.

FANS.—Jobbers and dealers are ready for the advance of General Humidity. It is known that some buyers have shaded their 1918 orders as compared with last year. In some quarters a disposition is noted to gamble a bit on a cooler summer.

ATLANTA

There is very little change in general conditions to record for this week. Official announcement has been made that Atlanta and New Orleans have been selected as distributing centers for the Quartermaster's Department. This will call for the erection of new warehouses at New Orleans and extensions to the present Southeastern warehouse facilities in Atlanta.

Coastal cities report a great influx of skilled labor for shipbuilding work. Although extensive housing plans are contemplated, and more or less work has already been done along this line, facilities are far from being adequate. It is expected that construction of this type will expand the present market for staple lines, which, manufacturers and jobbers state, shows exceptional possibilities for 1918. The Foundation Company of New York will invest \$1,250,000 at New Orleans for the establishment of a plant to construct a new unsinkable type of steel steamship.

LAMP CORDS.—Stocks are in good shape and ample to take care of the present requirements. Buying continues steady. Prices remain firm.

PANELBOARDS.—There is considerable activity here. Deliveries are being made in two weeks on the panelboards and in ten days on the cabinets.

CONDUIT.—Large orders are being placed, but shipments are very discouraging. The long-expected government requirement for steel has tended to stiffen prices on lots sold from local stocks. While it is conceded that conduit is going to be very scarce during the next few months, no material increase in price is anticipated locally.

SECOND-HAND APPARATUS.—Better promise of shipment on standard motors and transformers has had some effect on the market. Some pieces are not moving so rapidly as they did several months ago. There is a good demand, however, for small direct-current motors, generators, rheostats and miscellaneous material.

WIRING DEVICES.—The volume of business continues large. Prices have advanced this week. Shipments are coming in fairly well.

BOXES AND FITTINGS.—Prices are firm and shipments good. This line has been quite active during the first quarter, and one manufacturer states that sales are well over the same period last year. Jobbers have ample stocks.

ELECTRIC HOISTS.—Shipyards and government warehouses have opened up an extensive field for these, and substantial sales are reported. Although a large quantity of this equipment is being purchased in the East, South-eastern representatives are handling numerous inquiries. The government and industries securing preferential shipments can get the small outfits in two or three weeks. The delivery promise on monorail apparatus, however, has been advanced to eight to twelve months.

SEATTLE

General business continues on the high levels established months ago, with noticeable increases in sales along several lines, including power apparatus for shipyards, which will shortly be in complete operation. A feature of the week's business was a large order placed by a Seattle manufacturing concern for measuring instruments, ammeters, voltmeters, etc. The order is one of the largest ever placed in the Northwest. A pole order of considerable magnitude for electric transmission-line construction was also placed. The contract is for new work, which is gratifying, as other orders placed since the first of the year have been for maintenance only. Trying labor conditions are affecting the electrical trade seriously, and measures of relief afforded are exceedingly small. Conduit shipments have loosened up considerably and power apparatus, including motors, is coming through better.

The feature of the week's industrial activity was the taking over of the shipyard of the Seattle Construction & Dry Dock Company by the United States Shipping Board, which in turn leased the plant to the Skinner & Eddy Corporation for an indefinite period. Subsequent to the transaction the Shipping Board awarded a contract to Skinner & Eddy for additional steel ships, to cost \$100,000,000. This order smashes all Pacific Coast records, bringing the grand total of shipbuilding contracts to approximately \$250,000,000.

Several industrial plants of considerable size and importance allied to shipbuilding are making arrangements to begin early operations in the Puget Sound district. Work on a two-hundred-thousand-dollar factory for manufacturing machinery for steamships was started in Aberdeen. Orders for considerable electrical equipment for this particular plant were placed during the week. Another large wooden shipbuilding plant is projected in Everett. A four-story concrete hotel one block long and 260 ft. deep, for navy yard workers, is announced for Bremerton, and twelve apartment houses, containing sixteen apartments, for Vancouver, Wash. Approximately \$170,000 will be spent at Camp Lewis in constructing additional barracks for 6000 more troops. Base hospital improvements costing \$100,000 are also planned.

The market for building materials is increasing steadily, now that the government has authorized wood construction for industrial housing. Further increases in demand will result in orders for 50,000,000 ft. of Douglas fir. The production of spruce for aircraft purposes will be tripled.

The domestic appliances movement continues gratifying.

Washing and sewing machines, perhaps, are the best sellers, though vacuum cleaners, flatirons and smaller household utensils are moving briskly. The volume of sales, according to a majority of the jobbers, is far ahead of the same time last year. Dealers report that benefits are still resulting from the pre-Christmas sales campaign. Central stations in this territory are energetically pushing sales with pleasing results. Fixture sales are considerably heavier than anticipated or reported heretofore. This is due to an increase in residence building, apartments and summer homes. Prices show but slight changes and stocks are ample and varied. Jobbers are carrying light stocks of fans, as are the dealers. The season here is short.

SAN FRANCISCO

Reports for the past week show that the dealers' counter business has been poor and that the contracting business has been fair. The members of the recent N. E. L. A. conference at Del Monte returned to their tasks greatly heartened and stimulated. The value of building construction under way in the three cities of San Francisco, Los Angeles and Oakland respectively, for the month of April, was \$910,000, \$776,000 and \$593,000, government work being censored and not included. Deliveries are much better, it being possible to procure large sizes of conduit, large sizes of rubber-covered wire and other staples.

Oriental shippers are hampered by a lack of available shipping space, and it is reported that a big Honolulu warehouse and dock deal has been held up indefinitely on account of this lack of space for material. The United States government reports considerable work to be done to the Fort Mason quartermaster's depot and the Benicia arsenal. New packing plants are being erected at Livingston, Palo Alto and Wheatland. The Union Oil Company is constructing new tanks, office buildings and housing at San Jacinto. The shipbuilding yards of Moore & Scott and the Bethlehem Steel Works have arranged to construct new machine shops and certain office buildings. Word has been received from Washington, D. C., that the first place to receive government aid in the housing of shipbuilding yards will be Mare Island, the government navy yard, where work is to be done under the direction of the Navy Department.

CREDITS AND COLLECTIONS.—Credits and collections are reported fair, with a tendency on the part of credit men to limit outstanding accounts but to assist dealers by the extension of longer terms when the dealers have sold the more expensive devices on time payments.

FIXTURES.—Sales are good but considerably hampered by a strike in one of the large Eastern factories. There is very little call for fixtures that are manufactured along the Coast in various shops, because of lack of building demanding their use. Sales are being confined to glassware with a few brass fittings or rods for supports.

STORAGE BATTERIES.—Manufacturers report a call that is greatly increased over last year, this being due to the greater number of cars used and the heavy service demands that are being made on them.

SEWING MACHINES.—The demand for electrically driven machines and for separate motors continues practically unabated, and will without doubt be increased by the present Red Cross drive.

MOTORS.—The call this year has exceeded all expectations, even after allowing for increased sales for pumping plants due to the lack of rainfall. Strangely enough, this call is for larger sizes, ranging from 15 hp. to 30 hp., showing that large estates, which formerly depended upon natural methods of irrigation or regular systems, have been forced to call for electrical aid.

ELECTRICAL PUMPS.—Recently there has appeared a demand for a small electrical pump driven by 1 1/2-hp. to 1/2-hp. motors, and used to average the pressure in large apartment houses or residences.

MOVING PICTURE DEVICES.—A new adapting device is being shown by dealers, operators and theaters, which is designed to do away with the old carbon arc and its requirement of direct current. This adapter utilizes the 600-watt, 30-volt Mazda C lamps.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Buffing and Grinding Motors

Double-spindle and single-spindle motors for grinding and buffing are being marketed by the Bodine Electric Company, 2254 West Ohio Street, Chicago. These machines are made both in alternating-current and direct-current types. The motors all develop 1/6 hp. and carry wheels of 5-in. (12.7

COMBINATION OUTFIT OPERATED FROM A LAMP SOCKET

cm.) diameter. Direct-current motors have a speed of 3000 r.p.m. and alternating-current motors a speed of 3400 r.p.m. The grinders are designed to operate from a lamp socket.

Automatic Motor Starter

Single-phase, polyphase and direct-current motors are automatically accelerated by means of the Johns type motor starter being marketed by the Machine Products Company, 2018 Locust Street, St. Louis, Mo. This device, according to the claims made by the manufacturer, attaches to the end of the motor bearing and effects a saving in wall and floor space over other types of starting equipment. It consists of

MOTOR STARTER SMALL IN SIZE AND SELF-COOLING

a plate mounted upon the motor shaft and revolving within the housing. Upon this plate are carried a set of slip rings, a set of laminated contacts, a centrifugally operated mechanism and a ventilated-type resistance. The resistance element is always in series with the motor circuit, the current being car-

ried to the starter through the medium of the brushes and slip rings. Upon closing the motor switch the plate revolves with the motor armature and the weights are thrown outward by centrifugal force. The distance the weights are moved outward depends directly on the speed of the motor. These weights actuate the contact arm and thereby cut out resistance from the motor circuit as the armature attains full speed. A device is provided which prevents the return of the contact arm should the motor speed decrease because of load or decreased voltage, but allows its return when the motor has come to a standstill.

Sphere-Gap Lightning Arrester

A sphere-gap lightning arrester now being manufactured by the Electrical Engineers' Equipment Company of Chicago consists essentially of a sphere gap and a horn gap in series with re-

HORN GAP AND SPHERE GAP IN SERIES

sistance to ground. This construction has been adopted by the company since it has been shown that a sphere gap will handle high-frequency surges more rapidly than a horn gap. A sphere gap will charge and discharge with great rapidity owing to its great surface and capacity. The horn gap is used to dissipate the arc which results from the surge, as this arc will follow up the horns and extinguish itself. The resistance tube is placed in series with the horn gap and affords an extremely straight path to ground.

Motor-Driven Hammer

A minimum number of parts is used in a motor-driven hammer that is being manufactured by the United Hammer Company, Oliver Building, Boston, Mass. These "Fairbanks" power hammers are operated by an adjustable crank allowing the operator to lengthen or shorten the strokes at will. Motion is applied to the hammer head by means of a connecting rod which carries a cross-head connected to the head by means of links. A heavy spiral spring is used to obtain an elastic blow which removes danger of breakage and also

prevents undue shock to the machine. With this arrangement a short quick blow is secured which is most effective and desirable in hammer work. The shaft journals are cast integral with the frame. The hammer is driven by a motor mounted on the machine and connected to the hammer pulley by means of a belt. The motor is left continually in operation during working hours, the belt slipping around the motor pulley when the hammer is not in operation. To start the hammer, pressure is applied to the foot treadle, which through an idler pulley engages the belt and starts the hammer, and as the pressure is increased the speed of the hammer and the force of the blow are increased accordingly. These machines are made in ram weights from 25 lb. to 300 lb. (11.3 kg. to 136 kg.) and require, respectively, motors from 2 hp. to 7.5 hp.

Motor-Driven Broomless Floor Sweeper

Waste that is liable to fall on the floor in cotton mills can be efficiently swept up and recovered by means of the Firth broomless floor sweeper that is shown in the accompanying illustration. It is equipped with an Edison B-4 storage battery and a 0.10-hp., 12-volt motor directly connected to a special fan which creates a suction that picks up the sweepings and delivers them to a waste receiver. This suction

WASTE PICKED UP AND DELIVERED DIRECTLY TO RECEIVER

air is passed and screened through the receiver, and the discharging current is regulated to force the lint and waste automatically from the spinning frames and other machinery into opposite

alleys and spare floors, to be picked up later by the machine. The motor is started and stopped by means of a key switch. The battery will drive the motor under ordinary conditions at normal constant speed for four hours and can be recharged by means of a General Electric Company Tungar rectifier that is furnished with the machine if desired. The apparatus is manufactured by William Firth, 200 Devonshire Street, Boston, Mass.

Automatic Electric Toaster

Toast can be automatically turned off by an electric toaster being manufactured by the Rutenber Electric Company of Marion, Ind. When the toast is done on one side a touch of the hand on the metal frame automatically turns the toast so that the other side faces the heat. The device also has extra heating surfaces for warming pieces of toast already done.

Locking Socket for Lamp

Maxolite lighting units are now being provided with locking sockets to prevent the removal of incandescent lamps by unauthorized persons. If an attempt is made to remove the lamp, it will rotate without backing out, and the manufacturers claim that this feature is superior to a device which locks the lamp rigidly in place, because any one trying to remove a rigidly locked lamp by force would be likely to break the bulb. This device is being marketed by the Central Electric Company of Chicago.

Three-Phase Wiring Supports

A device that permits an equilateral triangular arrangement of low-tension high-capacity conductors is being manufactured by the Delta-Star Electric Company, 2433 Fulton Street, Chicago.

NEAT AND COMPACT ARRANGEMENT OF THREE-PHASE CONDUCTORS

The manufacturers claim that this support gives a balanced circuit and reduces impedance to a minimum. It makes a compact and neat wiring arrangement for several distribution sys-

tems and allows a good space factor for the conductors. The support is especially desirable in mills, mines, railroad shops and on consumer premises.

Speed-Reduction Gears That Require Small Space

The description of the mechanical drive for steam-plant auxiliaries and electrically driven units manufactured by the Poole Engineering & Machine Company of Baltimore, Md., that appeared in the May 11 issue of the *ELECTRICAL WORLD* was misleading. The planet gears are not held stationary but rotate on their own axes and also revolve about the center of the pinion shaft as a center. The internal gear is held stationary and does not rotate as stated in the article.

Double Electric Range

A double electric range that has two ovens and four or six heating units has been placed upon the market by the Simplex Electric Heating Company, Cambridge, Mass. Each unit has a

RANGE MARKETING EITHER WITH OR WITHOUT A CANOPY

separate switch and is fused in a cut-out box placed at the end of the range. A small signal lamp indicates whether the current in each unit is turned on or off. The ovens have double walls filled with heat-insulating material. Each oven has a top and bottom heater. They are wired for a three-wire, 120-220-volt service and are furnished either with or without a canopy.

Motor-Driven Air Station

An isolated prepayment air station for supplying air to automobiles is being marketed by the Electric Appliance Company, 701 West Jackson Boulevard, Chicago. Air is furnished by a Brunner air compressor operated by an Emerson motor, both of which are contained in the pedestal base of the station. The station is equipped with 32 ft. (9.7 m.) of 0.3 in. (0.8 cm.) six-ply hose which is wound on a drum placed inside the base. This holder is

released by the deposit of a coin which at the same time starts the compressor. The compressor continues in operation until the holder is released and drawn back into the station.

Safety Switches

Externally operated inclosed switches are being manufactured by the Meyers Electric Safety Switch Company, 1236 Mission Street, San Francisco, Cal. The switches are being made in two types,

KNIFE BLADES ATTACHED TO FLANGED DOOR INSURE SAFETY

namely, type A and type B. Type A is a fused knife switch inclosed in a sheet-metal box. The knife blades are attached to the deeply flanged door of the box, so that opening the boxes operates the switch. This switch may be located in the open position. It is made in sizes suitable for 30 amp. to 100 amp. Type B is of the same general construction as type A, but is used only for such service as requires a service or entrance switch. It is made in sizes ranging from 30 amp. to 200 amp.

Electric Sign

The Flashtrac Sign Works, 210 North Clinton Street, Chicago, Ill., are manufacturing an art-glass electric sign constructed so that the sign sockets are flush with the art glass, permitting the sign lamps to project beyond the art glass. The sign is constructed in such a way that each letter is supported individually and is a separate unit. The entire frame is constructed of 1/8-in. (0.3-cm.) angle iron heavily coated with zinc to make it rust-proof.

Automobile X-Ray Station

For operating between the field hospitals and firing line a complete X-ray equipment mounted upon an automobile and deriving its power from a 2-kw. direct-current generator driven by the gasoline engine has been developed by the Bleaden-Dun Company, 11 South Desplaines Street, Chicago. The transformer and synchronous motor mounted in the cabinet of the cab operate the X-ray machine, which is of the interruptless type. The radiographic table can be tilted 90 per cent and is equipped with one X-ray tube under the table for fluoroscopic work and one tube above for radiographic work.

Combined Wire Holder and Insulator

No tie wires are necessary in the insulator recently brought out by Hubbard & Company, Pittsburgh, Pa., that may be attached to any type of support. The insulator has an arc-over

OPEN-END WALL PLATE PREVENTS ICE FORMING UNDER WIRE HOLDER

voltage of 1900 volts and provides a good safety factor for voltage up to 500 volts. An open-end wall plate is said to prevent ice forming under the plate in winter and forcing the holder from the wall.

Humidity Controlled by Electric Regulator

In order to regulate and maintain constant humidity of the box drying room, a Western manufacturer has installed automatic electrically controlled heaters. The humidity often varies in this plant from 40 to 100 per cent in twenty-four hours. In fact, with a change of wind the humidity at times varies 30 per cent in one hour. An instrument was designed in which a small rope of human hair is so connected to the mechanism that the change of linear dimension is multiplied sixteen times by a contact beam, which in turn closes a relay circuit and actuates the potential circuit contactor governing electric heaters. Before being used in the instrument the hair was treated so as to remove any oil present. The requirement was that the humidity in this room be held at 55 per cent, and in order to do this under the most adverse weather conditions it was calculated that a heater capacity of 33 kw. would be required.

The electrical distribution system at the plant is three-phase, 440 volts. When the humidity control apparatus was installed the only transformers conveniently available were 2200 to 110-120 volts. These were used as auto-transformers by making star connections on the lower side and taking taps out of the center. Then by connecting to the center taps on the low side of the respective transformers three-phase current at 125 volts was available. The high side of the transformer was connected delta. With this arrangement under the maximum unbalance imposed on the system, the voltage has been found to vary to an amount not in excess of 3 volts. Three very sensitive thermostats were located along the center line of the room at the quarter, half and three-quarter points respectively. These thermostats actuated two electrical contacts, which energized a relay on the control board. The re-

lay in turn energized one of the double-pole magnetic contactors, so that each contact controlled a section of the heaters totaling 2.5 kw. in rating. Twenty-two 1500-watt electric heaters were used, these being specially designed for three-phase, 125-volt operation.

Vacuum Cleaner for Factories

Dust and lint can be efficiently removed from machines in textile mills and similar plants by a vacuum cleaner that is now being marketed by the Kent Vacuum Cleaning Company of Rome, N. Y., and is known as the "Vacuna Jumbo." The cleaner works on the same principle as the one described in the March 23 issue of the ELECTRICAL WORLD, the only difference being that it is of a larger size. It has but one moving unit—the single motor shaft on

REMOVING LINT AND DUST FROM TEXTILE MACHINES

which are mounted two metal turbines for producing the vacuum. The ends of these shafts are housed in ball bearings contained in grease chambers.

The motor used is of the universal type and is made by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. Besides removing dust and lint from the intricate parts of the mechanism, this machine prevents the particles from escaping into the air, from which they will again settle on the machines and works. Fire hazard is also reduced in textile mills because the lint does not collect and become soaked with oil.

Motor-Generator Set for Automobile Batteries

The St. Louis Electrical Works, 4060 Forest Park Boulevard, St. Louis, Mo., are manufacturing a line of motor-generator sets especially designed for charging automobile starting and lighting batteries. The motor-generator sets are designed for simplicity and high efficiency. Three sizes of machines are made. One size will deliver 40 amp. at 60 volts and weighs 520 lb. (236 kg.).

A second size will deliver 25 amp. at 40 volts and weighs 274 lb. (124 kg.). The third size will deliver 12 amp. at from 24 volts to 30 volts and weighs 143 lb. (65 kg.). The largest size will charge as many as sixty-four batteries at one time.

The generator in these sets is of the straight-shunt type. The shunt winding is made of enameled wire. The poles are built of laminations, and the armature is constructed of electrical sheet steel with a comparatively large number of slots. Both the motor and generator are equipped with ball bearings.

Feeder Wire Splicer

A light feeder wire splicer that is easily installed and so designed as to permit removal and reuse is being manufactured by the Ohio Brass Company, Mansfield, Ohio. This device is non-fouling, and can be pulled over cross-arms with foreign wires without catching and thereby causing damage to the wires.

Cut-Out for Farm-Lighting Systems

Farm-lighting systems can be automatically controlled by the reverse current cut-out, as shown in the accompanying illustration. This device will close the circuit when the generator voltage is about 40 volts, and will automatically open it when the charging current is reduced to zero and the battery voltage is higher than the generator. It is especially adapted for use with a gas-engine-driven dynamo set of 1200 watts or less, and is made in standard sizes for 40 volts and 30 amp. Combining reverse cut-out with the start-stop and ignition switch, protec-

COMBINED CURRENT CUT-OUT AND START-STOP AND IGNITION SWITCH

tion is obtained against the damage usually caused when switches are closed at the wrong time. The engine is started by pushing a handle of the switch. This device is manufactured by the Ward Leonard Electric Company, Mount Vernon, N. Y.

Trade Publications

BLOWERS.—The Coppus Engineering & Equipment Company, Worcester, Mass., has issued a bulletin describing its turbo-blowers for undergrate draft.

MOTOR PROTECTION DEVICE.—"The Proper Care of Electric Motors" is the title of a booklet issued by the Motor Protection Company, Pawtucket, R. I.

PIPES.—The A. M. Byers Company, Pittsburgh, Pa., has issued a circular showing a micro-study of Byers wrought-iron pipe and how a cross-section of Byers 1½-in. pipe appears magnified sixty diameters.

ELECTRIC LIGHTING SYSTEM.—"Electrically Lighted Country Places" is the title of a circular issued by the Brackett, Shaw & Lunt Company, Somersworth, N. H., describing its "Quality" electric lighting system.

WATER SYSTEMS.—The Brackett, Shaw & Lunt Company, Somersworth, N. H., has issued a circular describing the Reliance hydro-pneumatic water system. This system gives water under pressure for country places and has all the conveniences of city water systems.

MOTOR GENERATORS.—The St. Louis Electrical Works, 4060 Forest Park Boulevard, St. Louis, Mo., has issued a booklet describing and illustrating its motor-generators and charging panels, which are designed especially for charging automobile starting and lighting batteries.

ELECTRICAL LABORATORY APPARATUS.—The General Electric Company has issued bulletin No. 40,406, describing a complete line of small electrical laboratory apparatus for educational institutions. These units have been designed and built to incorporate the general characteristic features of large commercial electrical types, but of dimensions, capacities and interchangeability of parts adapted to experimental and instruction purposes. This bulletin is well illustrated and gives a list of nearly 120 institutions where G-E electrical laboratory apparatus have been installed.

RECEPTACLES AND APPLIANCES.—"Diamond H" switches are illustrated and described in a bulletin being distributed by the Hart Manufacturing Company of Hartford, Conn. The devices included in the booklet are push-button switches, rotary push and rotary surface switches and flush receptacles. Remote-control and automatic door switches are also described in full, with details of construction. The "Diamond H" relay-control system, with double-throw combinations, is illustrated by wiring diagrams. No-voltage-release remote-control switches are discussed and wiring diagrams printed.

LIGHT FOR THE CLOTHING INDUSTRY.—The Edison Lamp Works of the General Electric Company have prepared bulletin No. 43,410, containing the latest information as to the correct methods of lighting industrial plants, especially those devoted to the manufacture of clothing for our fighting forces at home and abroad. The bulletin is well illustrated, showing various lighting schemes most suitable for industrial purposes, and the facts are brought out that to conserve the employees' health, to save coal, to increase the output and to keep the workers contented, it is necessary that a shop be well illuminated according to modern methods.

INSULATING MATERIALS.—One of the most comprehensive catalogs issued on this line is that recently distributed by the Mitchell-Rand Manufacturing Company of New York City, entitled "Everything in Insulation." Not only are the many forms of insulating illustrated, but a detailed description is given of the treatment of the raw material through the various process stages until the finished article is reached. Various tables of values to those interested in the meaning, purpose and application of these specialties are furnished, with carefully prepared chapters by an expert on insulating paints and varnishes, waxes and compounds. The cross-index gives additional value to this very complete publication, copies of which may be obtained free on application to the company.

ELECTRIC INDUSTRIAL STOVES.—A new folder of publication No. 223 has recently been issued by the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., which illustrates and describes the C-H electrical industrial stoves for laboratories, printing and publishing plants, celluloid, hat and shoe factories, test rooms and industrial service in general. The stoves are made in two types, one with a rectangular heating surface

and the other with a disk or circular surface. The heating units are electrically welded to the working surface. The folder describes other details of construction and gives sizes, wattage and other data.

Trade Notes

G. V. P. LANSING, 508 West 112th Street, New York City, has been made local representative for the F. S. Payne Company, manufacturer of electric elevators, Cambridge, Mass.

THE M. B. AUSTIN COMPANY, manufacturer of the Austin line of conduit fittings and wiring devices, Chicago, is the new name of what was formerly M. B. Austin & Company.

THE INTERNATIONAL INSULATING CORPORATION of New York City has taken over the Dickinson Manufacturing Company of Springfield, Mass. The new company's facilities will be materially enlarged.

McMEEN & MILLER, engineers, Chicago, are being dissolved on account of war conditions. It is probable that Kempster B. Miller will continue in practice at the old address. Announcement will be made as soon as plans are more definitely formulated.

THE MAIN ELECTRIC MANUFACTURING COMPANY of Pittsburgh, Pa., is exporting lighting plants of several sizes to South America and India. The United States government has also recently ordered lighting plants in the larger unit size from the company.

THE EASTERN TUBE & TOOL COMPANY is now the name of what was formerly the Eastern Flexible Conduit Company. The company has added to its former line the manufacture of drill chucks and small tools. The factory is at 41 Gardiner Avenue, and the general office address is 594 Johnson Avenue, Brooklyn, N. Y.

THE CHAMBER OF COMMERCE OF PARIS, France, announces that the Paris Sample Fair, which was to be held from May 15 to 30, has been postponed to the first weeks of September. The chamber has received a certain number of pamphlets giving details relative to this national fair, and members may obtain copies of these at its offices.

THE CRANE PACKING COMPANY of New York City has moved to larger quarters in the Park Row Building. Julian N. Walton has been appointed manager. A. W. Payne, connected for some time as manager of the New York district, has been made sales manager of the United States and Canada with headquarters at the home office in Chicago.

F. E. LAUDERBACH has been appointed district manager for the Bussmann Manufacturing Company, St. Louis, Mo. He will have charge of the company's sales in Ohio, western Pennsylvania, West Virginia, Virginia, North and South Carolina, Georgia, Florida, Tennessee, Kentucky and Indiana. Mr. Lauderbach was formerly supervising engineer and manager of the St. Louis office of the National X-Ray Reflector Company.

THE ENAMELING & STAMPING CORPORATION OF NEW YORK, Long Island City, N. Y., has purchased the plant of the Fickling Enameling Corporation of that place. W. I. Fickling is president of the new company, and H. F. Holbrook, formerly president of the Holbrook company, secretary and treasurer. Its capacity has been greatly enlarged, and still further additions are being made to ovens and equipment.

D. C. & W. M. B. JACKSON, engineers, Boston and Chicago, on account of two members of the firm having gone into the national service and the third member expecting to do so as soon as practicable, announce that they will close their offices and suspend business for the duration of the war as soon as the work with which they are now occupied can be completed. The firm expects to resume business on the conclusion of the war.

THE DRIVER-HARRIS COMPANY of Harrison, N. J., announces the election of the following officers: Frank I. Driver, president; Arlington Benschel vice-president; Leon O. Hart, second vice-president; Frank L. Driver, Jr., third vice-president; Percival E. Reeves, treasurer; Stanley M. Tracy, assistant treasurer, and M. C. Harris, secretary. Wilbur B. Driver, formerly vice-president, general manager of manufacturing, has retired from active participation in the business. Mr. Driver says that probably he will engage in a similar line.

New Incorporations

THE GRAZIER ELECTRICAL PRODUCTS COMPANY of Johnstown, Pa., has been chartered with a capital stock of \$10,000 by J. S. Grazier and others.

THE LILLOCK ELECTRICAL COMPANY of Iowa City, Iowa, has been incorporated with a capital stock of \$5,000 by C. H. Myers, C. W. Lillock and others.

SPIERRY & BITTNER of Pittsburgh, Pa., has been granted a charter with a capital stock of \$10,000 to deal in electrical machinery. William A. Bittner is treasurer.

THE RAILWAY & POWER EQUIPMENT COMPANY of New York, N. Y., has been organized with a capital stock of \$100,000. The directors are: A. G. Logan and Ernest Stuart of Brooklyn.

THE KAY BEE MANUFACTURING COMPANY of Los Angeles, Cal., has been chartered with a capital stock of \$25,000 by Kirk White, B. A. Weyl and Charles E. Fleming. The company proposes to manufacture lighting fixtures, etc.

THE GUIDE & SIGNAL LIGHT COMPANY of Shelbyville, Ind., has been organized to manufacture an oscillating device for fans and searchlights, invented by L. Greenberg of Indianapolis. C. S. Camplin of Detroit, Mich., will be manager.

THE ELECTRICAL SERVICE & SUPPLY COMPANY of Sharon, Pa., has been incorporated with a capital stock of \$5,000. The incorporators are: Charles R. Nelson of Sharpsville; George R. Davis, Frank L. Kreider, Karl Kohn and C. L. Kemery of Sharon.

THE B. F. S. MANUFACTURING COMPANY of Worcester, Mass., has been incorporated by B. F. Stenman, Carl W. Fors, Charles E. Mattson and Henry Lindberg. The company proposes to manufacture electric valve grinders and special machinery.

THE LIBERT LIGHTING SUPPLY COMPANY of New York, N. Y., has been incorporated by Henry Hoffman, Maurice P. Hartman of New York City and Aaron Weiss of Brooklyn. The company is capitalized at \$5,000 and proposes to deal in electric and gas supplies, etc.

THE BEACH ELECTRIC COMPANY of San Francisco, Cal., has been incorporated by Harry Beach, Theodore O. Pass, A. P. Burr, all of San Francisco, Cal. The company is capitalized at \$10,000 and proposes to do a general electrical and mechanical electrical engineering business.

A. A. SHEA, INC., of Springfield, Mass., has been incorporated with a capital stock of \$12,000 to manufacture and deal in electrical machinery and equipment. The directors are: Augustus Shea, 91 Pearl Street, Springfield president and treasurer; L. R. Schechterle and E. J. Roberts.

THE VENTILATOR FAN COMPANY of New York, N. Y., has been incorporated with a capital stock of \$5,000 to do a general electrical and mechanical engineering business. The incorporators are: J. Gember, 10 Prospect Park S. W., Brooklyn; M. A. Connelly and Paul G. Burroughs of Brooklyn.

THE WILSON ELECTRIC COMPANY of Jacksonville, Fla., has been incorporated with a capital stock of \$5,000 to manufacture and deal in and repair electrical supplies and machinery, etc. The officers are: Jesse L. Wilson, president; M. W. Wilson, vice-president, and W. J. Wilson, secretary and treasurer.

THE INTERNATIONAL INSULATING CORPORATION of New York, N. Y., has been incorporated with a capital stock of \$60,000 by O. and A. Heinemann 25 West Forty-fifth Street, and J. Schechter, 10 Wall Street, New York City. The company proposes to deal in insulating materials, phonographs and talking-machine records.

CONNETT, BURTON & COMPANY of New York, N. Y., has been incorporated by W. S. Lare, H. Rogers and H. McAndrew, 30 Broad Street, New York City. The company is capitalized at \$300,000 and proposes to act as agents contractors and engineers, in connection with electrical work, ice manufacturing, textile plants, etc.

THE ABELSON-LATLEY LIGHT CORPORATION of New York, N. Y., has been incorporated by S. Andrews, 12 Locust Street, Flushing; L. Fischel, 242 West Seventy-second Street, and H. H. Seabrook, 510 Audubon Avenue, New York City. The company is capitalized at \$50,000 and proposes to manufacture individual electric-light and power plants.

New England States

BANGOR, ME.—A 500 kw. generator is being installed in the Veazie power plant the Bangor Railway & Electric Company, a cost of about \$50,000. The company is now erecting transmission lines to Passadumkeag to supply electricity to the mill of the American Realty Company. This 33,000-volt line runs from Ellsworth to Brewer, Mead, through Castigan, Passadumkeag, and then to Lincoln. A power installation now being placed in the shipbuilding plant the Bangor Shipbuilding Company at South Brewer.

BIDDEFORD, ME.—The Public Utilities Commission has granted the petitions of the York County Power Company of Biddeford for approval of contracts with the Gunquit Village Corporation for lighting the streets of the village for a period of five years from June 1, 1918. Also for municipal lighting in the town of Wells for five years from July 15, 1917.

DERRY, N. H.—The Derry Electric Light Company is contemplating extending its electric transmission line from East Derry over the Hampstead Road to furnish electricity to residents in that section.

MANCHESTER, N. H.—Bids, it is reported, have been taken by the Manchester Electric Light & Power Company for the construction of an addition, 25 ft. by 45 ft., to its local power house. F. W. Gray, 131 Elm Street, Manchester, is architect.

PORTSMOUTH, N. H.—Plans are being prepared for 200 houses which are soon to be erected by the Emergency Fleet Corporation, to be located at Portland, for the employees of the Atlantic Corporation shippers.

ENOSBURG FALLS, VT.—The Water and Light Commissioners have been instructed to purchase a suitable hoist for operating the four headgates at the municipal electric-light plant, and also to purchase a Tirrill voltage regulator, the cost not to exceed \$400, the old dynamo to be exchanged in part payment of same.

CLINTON, MASS.—Work has been started on the construction of a power house and a 100-ft. smokestack at the Ubahia Mills. Two new boilers will be installed.

NORTH BILLERICA, MASS.—The Board of Selectmen has approved the application of the Lowell Electric Light Corporation for extensions of its electric lines in Pine, Orange and Chadwick Streets.

STERLING, MASS.—At a special town meeting held recently it was decided to appropriate \$7,000 for the purpose of extending the electric lighting system to supply electricity to residents in Washacum Park.

STOCKBRIDGE, MASS.—The State Board of Electric Light and Gas Commissioners has approved the merger of the Stockbridge Lighting Company, the Lenox Electric Company and the Great Barrington Light Company, to be operated under the name of the Stockbridge Lighting Company.

WORCESTER, MASS.—The New England Power Company is planning to erect a new office building at 36-37 Harvard Building, to replace the one damaged by fire on March 9.

LONSDALE, R. I.—Work is under way at the installation of a new power system in the Lonsdale and Ashton mills of the Lonsdale Company. The mills, operated by water and steam power, are now being equipped for electrical operation. Energy for operating the mills will be furnished by the Rhode Island Power Transmission Company, a subsidiary of the Connecticut River Transmission Company of Brattleboro.

BRIDGEPORT, CONN.—Extensions are contemplated to the plant of the Remington Arms-Union Metallic Cartridge Company in Bridgeport, including the erection of an addition, 112 ft. by 256 ft.; one two-story building, 50 ft. by 220 ft.; two one-story buildings, 60 ft. by 120 ft., and several other one-story structures.

NEW HAVEN, CONN.—Work has begun by the United Illuminating Company for laying the cables for the ornamental lighting system in Grand Avenue from Olive Street to Mill River.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way.

John H. Deeves & Brother, 103 Park Avenue, New York City, for the construction of an addition, 30 ft. by 40 ft., to its boiler plant.

BROOKLYN, N. Y.—Plans have been prepared by the Bush Terminal Company, 100 Broadway, New York, for the construction of an addition to its local transformer station. Improvements are also contemplated to the present building.

BROOKLYN, N. Y.—Contract has been awarded by the James A. McCafferty & Sons Manufacturing Company, 505 Driggs Avenue, Brooklyn, for the construction of an addition to its plant in Middle Village to W. Southall of Middle Village, to cost about \$50,000. The company manufactures dry batteries, etc.

BROOKLYN, N. Y.—Plans are being prepared by Helmle & Corbett, of Brooklyn, architects, for the building to be erected for the Williamsburg Hospital, at the corner of Driggs Avenue and South Ninth Street. The proposed building will be 126 ft. by 150 ft., seven stories high. The cost is estimated at \$350,000.

BUFFALO, N. Y.—The Demarest Heating Corporation is considering plans for extensions and improvements to its plant.

BUFFALO, N. Y.—Plans have been prepared for the erection of an addition, 35 ft. by 55 ft., to the engine plant at the works of the Fleischman Malting Company, at 2212 Niagara Street, to cost about \$12,000.

BUFFALO, N. Y.—Extensions are contemplated by the Foster Specialties Company, Eighteenth Street, including the erection of a three-story addition, 50 ft. by 250 ft., to its mold shop, a one-story foundry and a six-story general manufacturing building.

NEW YORK, N. Y.—The Interborough Rapid Transit Company is building a new transformer station at 150 East Fifty-seventh Street, to cost about \$45,000.

NEW YORK, N. Y.—Bids will be received by the Board of Health, Department of Health, Centre and Walker Streets, New York City, until June 3 for furnishing and installing lighting fixtures, etc., together with all necessary alterations, etc., as follows: (a) In the pavilion for venereal diseases; (b) in the dormitory for female help on the grounds of the Riverside Hospital at North Brother Island, borough of Bronx. Plans may be seen and blank forms, etc., obtained at the office of the purchasing agent of the Department of Health, Centre and Walker Streets, New York City.

NEW YORK, N. Y.—Bids will be received by W. W. Wotherspoon, superintendent of public works, Capitol, Albany, until June 18, under terminal contract No. 105, for installing the electric wiring, lighting, power, battery-charging equipment and auto scales for Pier 6, East River, New York City. Plans and specifications, proposal blanks, etc., may be obtained at the office of the superintendent of public works, Albany; office of the assistant superintendent of public works for the Middle Division of Syracuse, office of the assistant superintendent of public works for the Western Division at Rochester, and at the canal office, Spaulding's Exchange, Buffalo.

NIAGARA FALLS, N. Y.—Plans are being considered by the City Council for the installation of new electrically driven pumping machinery in the municipal water-works pumping station on Buffalo Avenue.

NIAGARA FALLS, N. Y.—Preliminary plans have been prepared by the Niagara Falls Gas & Electric Light Company for the construction of a new gas plant in Niagara Falls. Willis Adams, Loan Association Building, is engineer.

SCHENECTADY, N. Y.—Plans are being prepared for the erection of an addition, about 120 ft. by 175 ft., to the boiler house at the local plant of the American Locomotive Company.

WATERTOWN, N. Y.—The Brown bill reorganizing the Water Board of the city of Watertown under the name of the Water, Light and Power Board, giving it authority to generate electricity on power sites already owned by the city, to light the streets of the municipality, and to sell excess power within and without the city, has been signed by Governor Whitman.

WELLSVILLE, N. Y.—Notice has been filed by the Kerr Turbine Company of an increase in capital stock from \$500,000 to \$2,000,000, to provide for expansion. The company manufactures turbine engines.

DOVER, N. J.—The New Jersey Power & Light Company of Dover has secured a contract to furnish electricity to operate the plant of the Thomas Moore Trench Machine Company, recently established at Rockaway.

GLOUCESTER CITY, N. J.—Work has begun on the construction of the proposed new power plant to be located on the site of the old Gloucester baseball grounds by the Husey & Jones Company. The new plant will supply energy to the plants of the Pennsylvania and New Jersey Shipbuilding companies.

JERSEY CITY, N. J.—Plans have been prepared by the Central Railroad of New Jersey, Communipaw Avenue, for the erection of an addition to its local power house, to cost about \$50,000.

JERSEY CITY, N. J.—The Board of Freeholders has approved an appropriation of \$25,000 to provide for initial expenditures in connection with the construction of the proposed new central power plant for Hudson County.

NEWARK, N. J.—Bids will be received by the Board of Education, Newark, until June 3, for electric work, lighting fixtures and heating system for the new addition to the Hawkins Street School. R. D. Argue is secretary.

NEWARK, N. J.—Plans are being considered by the Heller & Merz Company, Hamburg Place, for the erection of a new power house, 33 ft. by 70 ft., at its plant. R. G. Corry, 30 Cortlandt Street, New York City, is architect.

NEWTON, N. J.—Plans are being considered for the erection of an addition about 50 ft. by 50 ft. to the power plant of the Sussex Print Works, to cost about \$10,000. Andrew Kidd, Jr., 95 Liberty Street, New York City, is architect and engineer.

VERONA, N. J.—Bids will be received by the Board of Education of Verona until June 4, for the electrical work in connection with the new school building to be erected on Laning Avenue, near Elmwood Road. Bids will also be received for the installation of a heating system. John Culvert is district clerk.

WOODBIDGE, N. J.—Bids will be received by the Township Committee of Woodbridge until June 3 for electrical work in connection with the new municipal building to be erected, and the installation of a new heating system. Andrew Keyes is township clerk.

BEAVER FALLS, PA.—Work has begun on the installation of the proposed new street-lighting system here. The contract calls for the erection of 100-cp. gas-filled electric lamps mounted on steel poles. Owing to the high price of steel and the government demand for it the Borough Council has granted the Duquesne Light Company permission to use wooden poles temporarily.

LEBANON, PA.—Contracts have been awarded by the Lebanon Steel Foundry Company for the erection of an annex, 100 ft. by 200 ft., to its plant. A second two-ton Heroult electric furnace is to be installed with sufficient number of annealing furnaces to handle the product.

NEW CASTLE, PA.—The New Castle Electric Company has filed notice with the Public Service Commission of an issue of \$11,000 in bonds, the proceeds to be used for improvements.

NEW CASTLE, PA.—Notice has been filed by the Shenango Valley Electric Company with the Public Service Commission of an issue of \$39,000 in bonds, the proceeds to be used for extensions and improvements to its system.

PHILADELPHIA, PA.—The Philadelphia Electric Company is contemplating the erection of an addition, about 20 ft. by 45 ft., to its building at Arch and Mascher Streets.

PHILADELPHIA, PA.—Plans have been prepared for an addition, 30 ft. by 52 ft., five stories and basement, to the plant of James F. Burns, 713 Cherry Street, Philadelphia, manufacturer of electrical supplies and devices.

PHILADELPHIA, PA.—Contract has been awarded by John Bromley & Sons to George W. Stewart & Company, 2123 Germantown Avenue, for extensions and improvements to its boiler plant at Front and Dauphin Streets.

PHILADELPHIA, PA.—Work has begun on the construction of a one-story addition, 280 ft. by 345 ft., at the woodworking plant of George W. Smith & Company, located

Middle Atlantic States

BROOKLYN, N. Y.—Plans have been prepared by the Long Island Railroad Company for the erection of a new engine house, 100 ft. by 100 ft., at Eighth Avenue and Sixth Street, to cost about \$15,000.

BROOKLYN, N. Y.—Contract has been awarded by the Brooklyn Gas Company to

on Forty-ninth Street, near Botanic Avenue, to cost about \$150,000. The office of the company is at 3907 Powelton Avenue.

PITTSBURGH, PA.—E. R. Crawford, president of the McKeesport Tinplate Company, has announced that work will begin on the erection of a new steam power plant at its local mills, to cost about \$1,200,000, as soon as possible. Negotiations are pending with the government for the right to erect a wall 400 ft. long and 15 ft. high along the bank of the Youghiogheny River, at the site, between the Thirtieth and Fifteenth Street bridges, Port-view Township.

WILMINGTON, DEL.—Application has been made to the City Council by the Tidewater Power Company for permission to extend its street railway on South Front Street to the city limits and to construct a connecting track on Third Street.

BALTIMORE, MD.—The United Railways & Electric Company has been granted permission to construct its proposed extension to Wagner, in Anne Arundel County, near Baltimore, to serve several industries.

CUMBERLAND, MD.—The City Commission has notified the Edison Electric Illuminating Company of its intention to renew the contract for street-lighting for an additional term of ten years. On July 1, 1917, the city entered into a contract with the company whereby the latter was to light the streets and city buildings for one year ending June 30, 1918. Under the terms of the contract the city has the option of extending the contract for 10 years at the expiration of the year.

HUNTINGTON, W. VA.—Bids will be received by the Board of Commissioners of the city of Huntington until June 10 for lighting the streets of the city. Further information may be obtained from the city clerk and the city engineer. K. L. Hamilton is city clerk.

NEWPORT NEWS, VA.—Application has been made to the City Council by J. N. Shanahan of Hampton, representing the Emergency Fleet Corporation, for permission to construct a street-car line on Fiftieth and Fifty-fifth Streets and Virginia Avenue to furnish transportation to the workmen at the shipbuilding town now being established north of the city limits.

North Central States

CINCINNATI, OHIO.—The Mayor has requested the Cincinnati Traction Company to begin work at once on the construction of an extension to its Warsaw Avenue line.

CINCINNATI, OHIO.—Application has been made to the Council Committee of Street Lighting by J. H. Wulfekoetter, representing the residents of Cottage Hill, asking for a better street-lighting service in that suburb. The present system he states is inadequate, and that many of the streets have no lamps.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, until May 31 for motor drives for two sluiceways for the Division Avenue pumping station. Blanks and specifications may be obtained on application to the commissioner of water.

CLEVELAND, OHIO.—An agreement has been reached between the Municipal Electric Light Department and the Cleveland Electric Illuminating Company through the National Council of Defense whereby an interchange of electric output will be made. The proposed connection will cost about \$90,000 and will include the erection of an overhead line between the East Fifty-third Street station of the municipal system and the power plant of the Cleveland Electric Illumination Company on East Seventy-second Street, to provide interchange of power in case of breakdown of either plant. It will be financed by the National Council of Defense.

GALION, OHIO.—The plant and holdings of the North Electric Company of Galion have been taken over by a new corporation to be known as the North Electric Manufacturing Company. The company is capitalized at \$3,000,000 and will carry on the business in this city on a much larger scale.

MASSILLON, OHIO.—Work has begun by the Massillon Electric & Gas Company on the construction of a new switchboard at its plant on South Erie Street, to replace the one destroyed by fire recently. J. F. O'Connor is superintendent.

POMEROY, OHIO.—Work has begun on the construction of the power house for the local lock and dam under the supervision of E. H. Groot, government super-

intendent of the lock and dam. The building is to be 40 ft. by 19 ft.

TOLEDO, OHIO.—The Liberty Equipment Company, recently incorporated with a capital stock of \$100,000, proposes to operate a tractor train service between Detroit, Mich., and Toledo, Ohio, at once. The company will begin with a high-power tractor and 16 trailers. Later on the Liberty Highway Company will operate tractor trains between Toledo and other cities. Frank C. Schmidt and Frank L. Baird are interested in both companies.

YOUNGSTOWN, OHIO.—The Hydraulic Gas & Power Company contemplates increasing its capital stock from \$200,000 to \$300,000, the proceeds to be used for extensions and improvements to its system.

INDIANA HARBOR, IND.—The Mark Manufacturing Company has awarded the contract for the construction of its proposed new steel plant at Indiana Harbor to the Powers-Thompson Company of Joliet, Ill. The original plans provided for an expenditure of \$2,000,000, but it is estimated that the plant complete will cost about \$5,000,000.

SHELBYVILLE, IND.—The Guide & Signal Light Company, recently organized, is planning to establish a plant for the manufacture of an oscillating device for fans and searchlights, invented by L. Greenburg, of Indianapolis. C. S. Camplin of Detroit, Mich., will be manager.

CARBONDALE, ILL.—The Illinois Central Railroad Company is planning to erect a 72-stall roundhouse and mechanical plant in Carbondale, to cost about \$200,000. Much of the heavy work will be transferred from the Burnside shops to this plant.

CHICAGO, ILL.—Contract has been awarded by the Electric Steel Company, Wood and Thirty-first Streets, to the E. W. Sproul Company, 1120 West Thirty-first Street, for the erection of a one-story extension, 130 ft. by 300 ft., to its foundry.

GALLESBURG, ILL.—The installation of the new ornamental lighting system in the business section of the city is nearly completed. The cost of system is estimated at about \$30,000.

MOLINE, ILL.—A new 22,500-kw. turbine is being installed at the power house of the Tri-City Railway, Light & Railways Company in Moline.

ROCKFORD, ILL.—A resolution has been adopted by the City Council providing that steps be taken to secure a bond issue of \$500,000 for establishing a municipal electric-light plant in Rockford.

MILWAUKEE, WIS.—Contract has been awarded by the Pawling & Harnischfeger Company of Milwaukee for the construction of a machine shop addition, 80 ft. by 175 ft., to its main plant at Thirty-eighth and National Avenues.

MILWAUKEE, WIS.—Plans are being prepared by the Allen-Bradley Company, 495 Clinton Street, for the erection of an addition, 50 ft. by 100 ft., to its shop. The company manufactures rheostats and other electric controlling devices, etc. A. C. Eschweiler, Goldsmith Building, is architect.

MILWAUKEE, WIS.—The Universal Machinery Company, 784 Thirtieth Street, Milwaukee, has engaged Frank E. Gay, architect, 86 Michigan Street, to prepare plans for its proposed new foundry and machine shops, to be located at the foot of Sixty-fourth Avenue. The foundry equipment will include one 10-ton crane and a number of smaller cranes and hoists. The cost of the work is estimated at \$250,000. E. C. Devlin is president.

CHASKA, MINN.—Bids will be received by the City Council of Chaska until June 3 for one 4-in., two-stage, high-lift centrifugal pump, directly connected to a 20-hp., 60-cycle, 220-volt General Electric squirrel-cage induction motor with hand compensator. The outfit to be designed to deliver 250 gal. per minute against a total head of 115 ft. J. M. Aretz is city clerk.

COLERAINE, MINN.—Bids will be received by the Board of Education of School District No. 2, Itasca County, Coleraine, until June 1 for electric wiring and fixtures for school buildings at Marble and La Prairie. Separate bids to be submitted for fixtures in each building. W. T. Bray, Fidelity Building, Duluth, is architect.

GLEN LAKE, MINN.—Bids will be received by Sund & Dunham, architects, 514 Essex Building, Minneapolis, until May 31 for a built-in refrigerator and refrigerating machinery at the tuberculosis sanatorium for Hennepin County. Rose & Harris of Minneapolis are engineers.

WILLMAR, MINN.—Bids will be received by the State Board of Control, State Capitol Building, St. Paul, until May 28,

for the erection of farm buildings, including general contract work, plumbing and electrical work, at the State Asylum at Willmar. Plans are on file at the office of the Board of Control St. Paul, office of the superintendent of the institution, Willmar, and at the Builders' Exchange in St. Paul, Duluth and Minneapolis. C. H. Johnston, 715 Capital Bank Building, St. Paul, is architect.

KANSAS CITY, MO.—Plans have been completed by the City Engineering Department for commercializing Blue River from its mouth to Fifteenth Street. Plans provide for a dam at Tenth Street, but for no lock, the boats and barges to be placed on a low car below the dam and pulled around it to a higher level on track by electric power. The cost of the entire project is estimated at about \$1,000,000.

CROSBY, N. D.—The building occupied by the Crosby Light & Power Company and the Crosby Auto Company was recently destroyed by fire. The damage to the electric plant is estimated at \$18,000 and to the auto company at \$10,000.

PEMBINA, N. D.—Bids will be received by the school board of Pembina at the office of the clerk until June 11 for the construction of grade and high school. Separate bids to be submitted on heating, plumbing, electric wiring, vacuum piping, etc. Copies of plans and specifications may be obtained at the office of W. D. Gillespie, architect, Fargo, upon deposit of \$5. Peter Lere is clerk.

SCHUYLER, NEB.—At an election held recently the proposal to issue \$10,000 in bonds for improvements to the municipal electric light plant was defeated.

PLAINVILLE, KAN.—The contract for erecting the proposed new electric transmission line from Plainville to Palco and also installing the distributing system in the latter place has been awarded to J. H. Lee. The Plainville Mill & Elevator Company, which is to furnish electricity in Palco, reserves the right to use the line and may install an electric system in Zurich.

QUINTER, KAN.—At an election held recently the proposal to issue \$5,000 in bonds for improvements to the municipal electric light plant was carried.

Southern States

GIBSONVILLE, N. C.—Plans are being considered by the Gibsonville Milling Company to erect an electric transmission line from Summers Mill to Gibsonville, a distance of 5½ miles.

ESTILL, S. C.—The Estill Enterprise & Fertilizer Company, recently organized, is contemplating the construction of a fertilizer plant. The proposed plans provide for the installation of a fertilizer mixer, cotton gin, ice factory and electric plant, to be driven by an oil engine. Part of the machinery, it is understood, has been purchased.

ACWORTH, GA.—Plans are being considered for equipping the Acworth Hosiery Mills with electrically operated knitting machines, to cost about \$16,000.

KEY WEST, FLA.—The Bell Telephone Company is planning to erect a new telephone exchange to cost about \$200,000.

DAYTON, TENN.—The Dayton Light & Power Company is erecting an electric transmission line from Spring City to Dayton with a view of abandoning its steam power plant at Dayton.

NIXON, TENN.—The Nixon Electric Light & Power Company, recently organized, has acquired the plant and holdings of the Nixon Electric Company. The new owners contemplate the installation of a new 17½-kw. alternator. W. L. Hoover is manager.

ROCKWOOD, TENN.—The Public Light & Power Company of Chattanooga is contemplating rebuilding its electric transmission line from Lenoir City to Rockwood in the near future, changing system from 19,000 to 66,000 volts.

ANNISTON, ALA.—A committee has been appointed by local business men to organize a company to build an electric or a gas-electric railway from Anniston to Camp McClellan. W. H. Weatherly, L. L. Crump and others are interested in the project.

DECATUR, ALA.—The construction of an electric railway from Decatur to Florence, Sheffield and Tusculumbia, a distance of about 45 miles, is under consideration. H. L. Morrill and D. S. Echols of Decatur, and C. E. Warwick of Vicksburg, Miss., are interested in the project.

DANVILLE, ARK.—The installation of an electric-lighting system in Danville is reported to be under consideration.

HELENA, ARK.—Bids, it is reported, are being received by the A. M. Richardson Lumber Company of Helena, recently incorporated, for equipment for power plant and mill. A. M. Richardson is one of the incorporators.

LITTLE ROCK, ARK.—The Arkansas Battery Company of Little Rock is planning to equip a plant and will purchase machinery to cost about \$16,000. W. P. Calloway is president.

PARAGOULD, ARK.—The plant of the Henry Wrepe Company, manufacturer of staves, etc., including machinery, boilers, engines and other equipment, was destroyed by fire, causing a loss of about \$75,000.

PINE BLUFF, ARK.—H. J. Burkhardt of Pine Bluff is reported to be contemplating equipping a woodworking plant, at a cost of about \$250,000.

PRAGUE, OKLA.—Arrangements are being made by the city of Prague for the erection of an electric transmission line south and west to connect with the transmission system of the Oklahoma Power Transmission Company. The work will include the erection of 22 miles of transmission line, an outdoor substation, equipped with three 75-kva., 33,000-2300-volt, single-phase transformers, two 500-gal. per minute motor-driven centrifugal pumps, directly connected, air compressor, etc. Bids, it is understood, have been received for the above equipment.

SHATTUCK, OKLA.—Bonds to the amount of \$75,000 have been voted for rebuilding the municipal electric-light plant and water-works system.

STILLWATER, OKLA.—Bids will be received by the State Board of Agriculture, Capitol Building, Oklahoma City, until June 4 (extension of date from May 2), for the erection of two buildings at the Agricultural and Mechanical College, including electrical work, etc. The cost of the building is estimated at \$200,000. F. M. Gault is president.

WALTER, OKLA.—The Blue Ribbon Oil & Refining Company, recently organized, is reported to be in the market for equipment for a 10,000-barrel pumping station and a refinery with a daily capacity of 5000 barrels. John Aldridge of Oklahoma City is president and general manager.

BANGS, TEX.—Martin & Davis are planning to rebuild their cotton gin, recently destroyed by fire. The cost is estimated at about \$200,000.

BRACKETTVILLE, TEX.—Extensive improvements and extensions, it is reported, are contemplated to the municipal electric-light plant.

McKINNEY, TEX.—The capital stock of the McKinney Telephone Company has been increased from \$45,000 to \$125,000, the proceeds to be used for extensions and improvements to its system.

Pacific and Mountain States

HANFORD, WASH.—Application has been filed at the land office by the Black-rock Power & Irrigation Company asking for an easement for the erection of a high-tension electric transmission line from Hanford to Priest Rapids, a distance of 35 miles. The company, it is assumed, contemplates irrigating a large tract of land lying above the proposed high line canal.

SEATTLE, WASH.—Plans are being prepared by Daniel Huntington, city architect for the addition of another floor to the municipal auxiliary steam-driven electric plant at Eastlake Avenue and Neilson Place. The additional space is to be utilized as an electrical testing laboratory.

SEATTLE, WASH.—Contract has been awarded by the Puget Sound Traction, Light & Power Company to the Stone & Webster Engineering Corporation of Boston, Mass., for the construction of a new coal-conveyor, concrete tunnels and hopper adjacent to its power house at 6600 Fourteenth Avenue, S.

SEATTLE, WASH.—Arrangements have been made by the City Lighting Department to purchase the surplus energy generated by the Stimson Mill Company at Ballard by using the waste material at the mill for fuel. The company agrees to deliver 1300 kw. for 12 hours and 300 kw. for the remaining 10 hours of the day at 0.4 cent per kilowatt-hour.

SEATTLE, WASH.—The Northwest Trading Company of Seattle is in the market for equipment for an electric-light and power plant of about 3000 kw. capacity. A turbine generating set is preferred, otherwise suitable generators directly connected to reciprocating engines, or an offer for

any plant from 1,000 up to 3,000 kw. The electrical system must be three-phase, 6600 volts, 60 cycles. Auxiliary apparatus including suitable boilers for coal, fuel and surface type condensing apparatus with cooling water figured at 75 deg. Fahr, is desired.

TACOMA, WASH.—Bids will be received by Hamilton E. Gronen, commissioner of light and water, Tacoma, until June 3 for furnishing the annual supply of incandescent lamps in accordance with specifications on file in the office of the commissioner.

WALLA WALLA, WASH.—As the first step toward the construction of a hydro-electric power plant to be run in connection with the municipal water-works system, the City Commissioners have ordered a survey of Mill Creek between the intake and Tiger Canyon. It is estimated that sufficient power can be obtained from Mill Creek to pump the water from the deep wells.

WATERVILLE, WASH.—Application has been made to the Douglas County Commissioners by the Chelan Falls Power Company for permission to construct and maintain an electric transmission line in Douglas County.

GOLD HILL, ORE.—The sale of the Rogue River Public Service Corporation's properties in Jackson and Josephine Counties to Newton W. Roundtree of Portland, for a sum just sufficient to cover the court charges, and subject to the bonded indebtedness, has been confirmed by the United States District Court. The holdings include a large acreage in the two counties and the power plants and franchises at Grants Pass and Gold Hill, with transmission lines and franchises in both cities.

PORTLAND, ORE.—Preparations, it is reported, are being made by the Pacific Power & Light Company for the erection of a 6600-volt, three-phase transmission line to supply service to two beet-sugar factories of the Utah-Idaho Sugar Company. The company is also planning to build a new outdoor substation near Kaholotus.

REEDSPORT, ORE.—Preliminary plans are being prepared by the Umpqua Light & Power Company for the construction of a new electric transmission line across the Umpqua River at Reedsport. The Umpqua company recently took over the property of the Gardiner (Ore.) Light & Power Company.

BERKELEY, CAL.—The contract awarded the Pacific Fire Extinguisher Company by the City Council for street lighting has been declared void by the District Court of Appeals in the district embraced by Derby, Warren and Garber Streets.

BISHOP, CAL.—Plans are being considered by the Nevada-California Power Company of Riverside for the erection of a high-tension transmission line to Ely, Nev., to cost about \$330,000.

BOLINAS, CAL.—The Chetco Mining Company is contemplating the installation of electrically driven pumping equipment at its local properties.

FRESNO, CAL.—Plans have been prepared for the installation of an electrolier-lighting system on South Van Ness Avenue.

LA MANDA PARK, CAL.—Tentative boundaries for a county lighting district have been located by the lighting committee. The proposed district extends from the Pasadena City limits to Oak Avenue and north from Colorado Street to White Street.

MARICOPA, CAL.—The Side Hill Oil Company has contracted with the San Joaquin Light & Power Corporation of Fresno to supply electricity for drilling and pumping of all wells on its property. Steam power will be used until the transmission line can be extended to the mine.

ONTARIO, CAL.—Plans have been approved for the erection of a new power house by the Ontario Power Company, to cost about \$60,000. It is proposed to build the new power plant just above Hog's Back, in San Antonio Canyon. It is expected to have the plant completed by Jan. 1, 1919.

REDDING, CAL.—Application has been filed by the city of Redding with the State Railroad Commission for an appraisal of the electrical distribution system of the Northern California Power Company in Redding. The city proposes to establish a municipal plant, for which \$40,000 in bonds have been voted.

RED BLUFF, CAL.—The installation of a municipal electric-lighting system in Red Bluff is under consideration.

SANTA ANA, CAL.—Plans have been filed by Kaufman & Sons of Santa Ana for the erection of a new factory at 1625 East First Street. The company manufactures spot lamps.

SANTA BARBARA, CAL.—A movement is under way for the installation of ornamental lamps on Anapamu Street from State Street to Anacapa. The proposed plans provide for removing overhead wires and placing them in conduits.

BONNERS FERRY, IDAHO.—The property of the Bonner Water & Light Company has been offered to the city for \$80,000. The first offer made through a bonding house several weeks ago was for \$125,000.

SANDPOINT, IDAHO.—The Falls Creek Mining Company is contemplating the installation of a power plant to furnish power for its proposed mill and compressor. The plans provide for the construction of a penstock 900 ft. long, providing for a fall of 260 ft.

OGDEN, UTAH.—The power station and car barns of the Bamberger Electric Railroad Company were recently destroyed by fire, causing a loss of about \$750,000.

BUTTE, MONT.—Improvements involving an expenditure of about \$70,000, are contemplated by the Butte Electric Railway Company in the near future. The proposed work will include double-tracking, new switches, etc.

HARLOWTON, MONT.—Work has begun on the installation of electrically driven machinery throughout the entire plant of the Montana Flour Mills Company, to replace steam power. Electricity to operate the mill will be furnished by the Montana Power Company.

COPPERFIELD, NEV.—The Washoe Copper Company of Copperfield is contemplating the erection of a new forge shop, engine plant and compressor works at its new plant near the Nixon-Nevada property. Copperfield has no post office.

Canada

GRANDE PRAIRIE, ALTA.—Plans are being prepared by the Town Council for the installation of an electric-lighting system, to cost about \$6,000.

CLOVERDALE, B. C.—The Whitlock Waterworks, Ltd., has contracted with the British Columbia Electric Railway Company for an extension of the electric transmission line to the waterworks pumping station. Preparations are being made to replace the gasoline engine with electric motors.

MISSION, B. C.—Extensions are contemplated to the plant of the King Beach Company of Mission, including the installation of additional boiler equipment.

NEW WESTMINSTER, B. C.—The Timberland Lumber Company is erecting a saw mill on the Fraser River, to cost about \$100,000.

REVELSTOKE, B. C.—Improvements are contemplated by the Lanark Mines Company, including the construction of a power plant and installing equipment. W. B. Dornberg of Spokane, is manager.

SYDNEY, N. S.—The Dominion Coal Company, it is reported, contemplates a power development at New Waterford, including the erection of a large power station.

COBALT, ONT.—The power house at the Penn Canadian Mine was recently damaged by fire, causing a loss of about \$5,000.

LEASIDE JUNCTION, ONT.—The Canadian Northern Railway Company is planning to build a roundhouse, coaling plant, ice house, etc., at Leaside Junction. George C. Briggs of Toronto is architect.

PERTH, ONT.—Plans are being considered for remodeling the street-lighting system this spring. It is proposed to change it from 132 to 60 cycles.

SAULT STE. MARIE, ONT.—The power plant of the Great Lakes Power Company was damaged by fire recently, causing a loss of about \$150,000. The plant will be rebuilt at once.

TORONTO, ONT.—Foundations are being laid for machine shop, blacksmith shops, pine and electric shops at the plant of the Dominion Shipbuilding Company, located at the foot of Bathurst Street. The main building will be 485 ft. by 220 ft. The company has contracts for the construction of 12 steel ships.

LEVIS, QUE.—The Levis County Railway Company, it is reported, contemplates improvements to its system involving an expenditure of about \$150,000.

REGINA, SASK.—Improvements are contemplated to the municipal electric-light plant, involving an expenditure of from \$175,000 to \$200,000, and will include the installation of a 5000-kw. electric generating unit.

Preparing for Conditions After the War

THE United States is to-day fulfilling her part in the great struggle for democracy, and yet if we would fulfill our own destiny in the years that lie ahead, it will be necessary for us to look beyond the contending armies, to look at the blue sky above the trenches, and ask ourselves, "After the war, what?" Having seen the vision of service, we must be careful not to let it fade. We must not feed on false optimism or false philosophy, or, ignoring stern facts, drop back into listlessness. The great problem of immediate importance is the winning of the war, and many trials and tribulations, much suffering and sacrifice must be endured before the war will be won. After that new conditions of life, society, trade and commerce will confront us. We must prepare now to meet them so as to be able to cope with them when they arise. Like the other nations in the combat, we shall be confronted with a colossal war debt, and if we are to face the future with equanimity, we must increase the national income by increasing the productivity of our industries. This will necessitate most cordial relations between capital and labor. Since the other nations will likewise endeavor to increase their productiveness and seek wider markets, our industries must be protected against dumping, and those which are unable to develop themselves by reason of undue foreign competition or other causes will need government assistance. Industries on which other and larger branches of national production depend must be promoted and safeguarded, and measures must be adopted to insure that the experience gained and the progress made by us during the war shall not be thrown away when new relations are established. The financial and economic strain will not be successfully met unless careful consideration is given to these matters in advance. One way of preparing for these after-the-war conditions is outlined in part in this issue.

Placing Emphasis on Home Financing

WHILE a great deal has been said and written about the advantages of selling securities of utilities to the people in the communities served, not nearly enough emphasis has been placed on this method of finding capital. Those who read figures giving the results of certain efforts along this line oftentimes fail to grasp the bigness of the thing. Many, for instance, have read that the Northern States Power Company raised more than \$1,000,000 in one year by this method;

but that sum by itself does not convey the real picture. When it is stated that \$1,000,000 was one-fourth the total capital requirements of the company for that year, we get the proper perspective on the success of the plan. This record was established in a territory composed of several hundred communities; but in the larger cities the method has been equally successful. St. Louis people recently bought \$1,500,000 of 7 per cent preferred stock of the Union Electric Light & Power Company in the short space of twenty days. The central station entered this campaign after the sale of the first Liberty loan and against the protest of brokers who said the thing could not be done. Nevertheless, the sales expense was less by far than it would have been if the capital had been secured through the regular channels.

The foregoing are merely typical instances of what has been done in two communities. Records of equal success have been made in California, in Maryland, in Oklahoma and in Ohio. In some cases the method was tried under the spur of necessity, in others it was a matter of choice. Successes are on record in many states; and they are successes in every sense of the word, for the effort succeeded not only in raising required capital but also in creating better public relations. It seems fitting, therefore, at this time, when capital is difficult to secure through regular channels, to place emphasis on these successes and to point out that there is an opportunity to do more home financing when Liberty loan and other governmental drives for money are not pressing.

Hydroelectric Heating Service

THE supply of heating service by hydroelectric systems is a possible field for preparedness work this year which should receive careful consideration. The shortage of coal which looms ahead in not a few sections of the country for the coming winter, far off as that season still appears, renders the extension of electric heating applications on systems where the supply of energy is derived from waterfalls a very important subject. Every pound of coal which can be saved by substitution means more fuel available for war and other vitally necessary service allied with military operations. It is not to be expected that the heating of buildings on a large scale by electricity will be carried out, but there is an immense field of service for anti-chill heating, so to speak, both in winter and in the fall and spring months.

If the fuel demand continues along the lines now apparent both in the anthracite and soft-coal fields,

many premises comfortably, even luxuriously heated last winter, will be subjected to a rigorous curtailment in the fall of this year. Householders will shut off certain rooms and live in more restricted quarters as regards warmth, and in a good many industrial and mercantile establishments closer control of heat will be insisted upon, accompanied often by actual stoppages of steam supply to departments not absolutely requiring such service.

Now there is an immense field in residential and commercial service where either high-intensity, short-hour or low-intensity, long-hour electric heating may prove of great value, and this is the time for companies prepared to supply energy for such service at low cost to get in touch with the manufacturers of electric radiators and other specialized heating devices for small spaces and make their plans for the extension of such service in time for the fall demand. The portability, cleanliness and simplicity of such equipment are strong points in its favor, and even if the energy is supplied at lighting rates there are many installations possible where short daily use would prove advantageous. For central stations supplying energy from coal-driven plants there are also many opportunities for usefulness in off-peak cooking and other special applications of an industrial character. A vigorous effort should be made this summer to capture a substantial amount of noon-hour electric cooking and heating business in down-town restaurants, hotels and clubs. The slump of the load curve between 12 m. and 2 p. m. in many cities where a big power load exists is literally a thorn in the flesh of efficiency, and every installation using electric heat during that valley helps to conserve coal at the point of use and also at the steam generating station. Hydroelectric plants are, of course, specially suited to the economic development of this kind of service.

Classifying Customers for Utility Convenience

THE work of progressive public service companies inclines one to the belief that it is virtually impossible to analyze too thoroughly their potential fields of service. Central stations may well take a leaf from the book of a large street-railway system which recently completed a card-index record of prominent individuals in its territory. The manager of this company believes that the people residing near his lines are the chief source of his revenue and hence are his most valuable asset. The company referred to can pick out within a few moments all the lawyers in the cities and towns in its territory, if it so desires. It can put in shape almost before one realizes it a complete list of school principals, municipal officials, members of committees in church and society organizations, leaders of women's clubs and persons falling under other classifications. Whenever something arises on the system which interests a particular class, or which interests the marked persons of a particular community, it is now a simple matter to draw out the names and addresses and circularize any group desired.

It costs a central station of good size a substantial sum to write a letter to all its customers, and often there is no need in a particular case to address 100 per cent of the list. Surely there would be something well

worth while in a classified and up-to-date analyzed list which could be segregated for the purposes of selling different classes of appliances or for recommending certain improvements in specialized illumination. Such lists, it is true, are often prepared as occasion demands; but it is safe to say that more work and more effective work can be done where a thoroughly representative permanent list of classified customers exists.

Many central stations know very little about their customers in detail, barring group exceptions, so that much of the effectiveness of distinctive publicity and service extension work along profitable lines is lost. Each manager must decide how far he wishes to analyze his patronage; but unless we are greatly mistaken he can hardly go too far in this direction in the interest of establishing a service of maximum value to the community in terms of the investment.

Electric Truck Service in War Time

IS IT not time to consider the electric truck seriously as a war measure of conservation? As things now look it is more than probable that there will be a considerable scarcity of gasoline during the next year. So much is needed for the truck service of the army and for auxiliary motor craft that the price is certain to rise notably even if there is not such an actual shortage as would justify the government in commandeering the major part of the supply. Steps have been taken to curtail the output of pleasure automobiles, but on the other hand the registrations show plainly that this year there will be more cars in operation than ever before. Under these circumstances it looks very much as if the electric truck would become desirable as an instrument of real conservation. It is quite certainly more economical than horse-drawn vehicles for a large part of our city service, and it is equally evident that under the fuel conditions of the next year or two it will be able to give the gasoline truck a very hard rub. To be sure, it calls on the central station for energy, but it calls for it normally at night, during the period of low load, where its added demand helps the load curve of the station and tends to economical production.

A clear line should here be drawn between electric vehicles as a whole and trucks. To make a thorough success of the electric pleasure care there needs to be an elaboration of charging stations covering the territory so as to make recharging convenient and easy. This would imply considerable investment which at present is perhaps not justified. On the other hand, a large increase in the electric truck service could be made without any considerable addition to the cost of charging stations and with very little increase in their number. The energy needed for driving the trucks constitutes a very desirable night load, taking coal, to be sure, but under circumstances which render its use economical. The work of central stations is now encompassed with government regulations. They are not at liberty to make extensions indefinitely with the hope of picking up business when so large an amount of their output is needed for work associated with the war. Their investment, however, would not have materially to be increased in order to handle the recharging of a considerable fleet of electric trucks belonging to various industries already customers of the central

station. It therefore would seem to be good policy to make an effort to encourage this kind of load, both to help out the load factor and to assist in the conservation of gasoline.

If the increase of trucks for city use in the next two or three years were chiefly in electric trucks, the gain all along the line would be very material. To the central station it would represent added business at a valuable point on the load line; to the user of the truck a convenient and economical method of distribution in city work, and to the government the release of a very large amount of petrol for military and naval uses. We are not advocating any sensational exploitation of electric trucks. They are quite able to take care of themselves at the figures for liquid fuel likely soon to be enforced. As a practical measure of economy in the distribution of goods the electric truck has already made an excellent reputation, and it will not take very much encouragement on the part of central-station operators to increase the use of these vehicles to a point where the saving will be very material. In theory the gasoline truck produces its power efficiently, in practice it is operated a large part of the time under very inefficient conditions; so that if one were looking merely for conservation of B.t.u., electric service would probably show on the right side of the balance sheet. In addition, there is the possibility of specially large and profitable uses of electric trucks in cities supplied from hydroelectric plants, in which there is generally a surplus of power at night that could be most efficiently used. Certainly the subject is one well worth looking into seriously and thoughtfully, with a view of seeing whether encouragement of this particular class of vehicles by the central stations will not have on the whole so good an economic effect as to warrant special effort.

The Summer Load of the Central Station

ONE of the things which worry the central-station manager who serves summer resorts is the problem of handling seasonal load with a fair prospect of remuneration. The exact character of the summer demand varies widely from place to place, ranging from the petty service of little cottages, peanut stands and frankfurter emporiums to the furnishing of complete electric service to half-million-dollar estates. The paper on the economic phases of summer load which is concluded in the current issue gives data from both these extremes and from intermediate points. That summer business adds materially and sometimes very largely to the earnings of the central stations admits of no dis-

pute. That it is as profitable as all-the-year-round load at the same price nobody is inclined to argue. It results very commonly in a maximum capacity demand during the summer months, much greater than in any part of the off-season period, thereby establishing readiness-to-serve at a cost which considered by itself would be somewhat staggering.

The economic nature of the situation hinges chiefly on the steadiness of the load and the length of the season. As respects the first, the diversity factor in the load of a summer colony may often be rather a favorable one, particularly when service is extended to all sorts of purposes, from lighting shacks to furnishing considerable blocks of power to a roller coaster. Summer customers as a rule, too, are not very fussy about extreme precision in regulation and are glad to get light on any reasonable terms to avoid the use and trouble of lamps and candles. A summer resort full of big estates is a very different matter, for it represents usually a load which is not only of considerable magnitude but which persists through a longer season and to a certain extent all through the year. The smaller and less pretentious resorts are likely to have but a short season, very variable from year to year, and never with any material amount of load after the heat of summer is over. The two extremes of summer service must therefore be treated on somewhat different principles. The big country place requires the best of service and may in the aggregate yield as good a return on the investment as the town establishment of the same owner, which is connected for a period not much longer and often not so well equipped with electric service.

It is the small resort, particularly the cheaper sort, which offers the most troublesome problem. Outside construction must be cheap, but inside construction cannot be shaved down on account of fire risk. The total amount of service, except for places of amusement, is small, and the latter furnish load only over a very brief season. The main point of the situation is that this kind of summer load can only be handled profitably at a higher rate than the regular one, on account of the large fixed charges and the small individual services, which involve many meters if energy is metered and many moral hazards if it is not. It is fortunate that the state commissions are taking a sensible and reasonable view of the situation and are making provision for remunerative summer rates. Granted these, such service can be made to pay a handsome addition to the yearly total. In certain territory a gain can be made by establishing interconnection with city plants and taking energy from the summer minimum of these to eke out the summer maximum at the resorts.

WHAT has the electrical industry done, particularly the central stations, toward winning the war? This is the theme that runs through the next issue—the N. E. L. A. "win-the-war" convention issue. The issue has been designed to be a supplement to the Atlantic City convention. None of the customary papers will be presented at the convention, but in the pages of the *ELECTRICAL WORLD* will be found a number of articles detailing the progress and developments of the past year in engineering and commercial activity. Due attention will be paid also to the problem of sub-

The Coming Issues

stituting female for male labor in the electrical manufacturing industry, and consideration will be given to the general background of central-station labor retention. Public relations broadly, with emphasis on the rate situation and the relation of utilities to the government's war program, will be other features of this issue. In addition, the problems affecting the present and future relations of manufacturer to central station will be touched upon. Economy in certain of its phases, as brought about by the war, will be the keynote of the engineering topics discussed.

Readjustment and Reconstruction Commission—I

A Suggestion to the President of the United States that He Appoint Qualified Men to Act Under His Authority and Direction in Preparing for After-War Problems

BY WINGROVE BATHON
Washington Representative ELECTRICAL WORLD

PEACE will come some day. In the meanwhile American industry is doing nothing whatever in an organized way to prepare for the necessary readjustment.

On the other hand, England and her colonies, France, Italy, the Teutonic empires, the far Eastern countries and the Latin-American countries have begun to prepare for readjustment and reconstruction.

What must we do?

This article, and articles to follow, are for the purpose of suggesting the immediate creation of an agency to deal with the situation which will confront American industry at the end of the war—to gather facts now, to make plans now, to educate now, and to lead the industries of the country in the victories of peace when the right time comes.

SCOPE OF THE PROPOSED COMMISSION

In detail, this is to suggest that a great service would be done the American people, and perhaps all of the free peoples of the world, in view of the resources of the United States, which must be drawn upon for a long period by the whole world after the war, if the President of the United States would appoint forthwith a commission, to be the President's own commission, to prepare for after-the-war problems—such a commission to be one not hampered by legislative enactments of Congress as to powers upon which it might be difficult for Congress to agree, not curbed and controlled by government appropriations or the fear of lack of them, but nevertheless certainly be established under the government sanction of an executive order and be assisted by the creation of an advisory council of government officials and possibly by the chairmen of some committees of Congress. Many executive officials and legislators are themselves too busy with the work of the war to lay aside their burdens of to-day to deal with after-the-war problems. Their assistants and associates should be used.

As to the main commission, it should include not only leaders in industry of all forms, taken from the ranks of private endeavor, but it should include leaders in labor, leaders in education and leaders in every other endeavor which enters into industrial effort. Such a commission should report only to the President and should take as much of its inspiration from his leadership as he may have time to spare from the conduct of the war with which he is charged by the Constitution. Such a commission might very well include in its appointees the following:

E. H. Gary, president of the American Iron and Steel Institute.

Samuel Gompers, president of the American Federation of Labor.

Arthur N. Talbot, president of the American Society of Civil Engineers.

C. P. Main, president of the American Society of Mechanical Engineers.

E. W. Rice, Jr., president of the American Institute of Electrical Engineers.

Sidney J. Jennings, president of the American Institute of Mining Engineers.

William H. Nichols, president of the American Chemical Society.

F. J. Tone, president of the American Electrochemical Society.

J. B. Doan, president of the American Machine Tool Builders' Association.

H. A. Wheeler, president of the Chamber of Commerce of the United States.

P. H. Gadsden, secretary of the American Electric Railway Association and resident Washington member of the Electric Railway War Board.

S. G. Williams, president of the Highway Industries Association.

In addition to these, the commission might also include the presidents of some of the various national organizations occupied with production and manufacture in the lumber, leather, rubber, textile, glass and other great industries of the country; also perhaps the president of the Farmers' Grange, the president of a great railroad, the president of a great shipping company, the president of a great educational institution, the president of a great insurance institution, and perhaps the president of the American Bar Association and the president of the American Medical Association, but, in any case, even if only to assure reports from abroad, the following representatives of American business in other countries:

A. V. Edwards, secretary of the American Commercial Club of Argentina, Buenos Aires.

Charles Lydecker, secretary of the American Chamber of Commerce for Brazil, Rio de Janeiro.

James R. Morse, secretary of the American Chamber of Commerce in China, Shanghai.

George M. Cassatt, secretary of the American Chamber of Commerce in England, London.

Charles H. Sherrill, secretary of the American Chamber of Commerce in Paris, France.

J. B. Stetson, Jr., secretary of the American Chamber of Commerce for Italy, Milan.

C. B. Parker, secretary of the American Chamber of Commerce for Mexico, Mexico City.

Preston M. Smith, secretary of the American Chamber of Commerce for Spain, Barcelona.

Theodore R. Yanco, secretary of the Chamber of Commerce of the Philippine Islands, Manila.

CHANGING FROM WAR TO PEACE BASIS

In Washington the peace-time industries of the country are now being placed upon a war basis in a gradual manner. There has been time for a gradual "turning over" in the further organization of the war, which has been proceeding steadily month by month. But when the industries of the country have been fully placed upon a war-time basis, when supplies of labor, sources of material, reserves of capital and the markets for production have all been altered to meet war needs, it will be impossible to place industry back upon a peace basis gradually without danger of disaster second only in importance perhaps to actual loss of the war.

To meet that danger there must be organized preparation, such as is now proceeding in all of the countries at war except the United States, and these suggestions are being made to set forth a working plan as a nucleus for discussion and action.

The facts and the prospects for the future are being discussed and acted upon in almost every country of the world except this. Literally thousands of books, pamphlets and other writings have been produced in foreign countries to educate the people along these lines. More than two years ago there was created in Great Britain a reconstruction committee, which has since become an agency of the British government, the work now being in charge of Dr. Christopher Addison, a Minister in the British Cabinet without portfolio, and more than two hundred sub-committees plentifully supplied with experts are now engaged in solving British after-the-war problems.

The details of what has been done in Great Britain and the other countries previously mentioned, some suggestions as to what should be done toward readjustment in this country, and suggestions for the personnel of an advisory council, also to be created by executive order, under the chairmanship, perhaps, of Frank Lyon Polk, counselor for the Department of State and second in command of that department, will be offered in following articles. The personnel of a suggested advisory council will be dealt with in the next article as of prime importance because this personnel will include many of the detailed legislative and executive war organization contacts of the United States, which must be continued at work long after the war in all likelihood, in order—to use a homely phrase—to assist in “unscrambling the eggs.”

There is need at once for a responsible high officer of the government, occupying a position such as that of the counselor of the State Department—and for him to have important associates—on such an advisory council, to answer fully, freely and day by day, now, the questions that a President's commission on readjustment and reconstruction might put to the government and to help solve the commission's problems.

After the war, because of accelerated thinking, we can secure the adoption of ideas that otherwise would not be acceptable or would be acceptable only after a very lengthy educational process. Therefore we have an opportunity now; for, in addition to such obvious readjustment and reconstruction work as the orderly reintroduction to industry of returned soldiers, the development of export trade and the use of our productive capacity for our industries expanded by war needs, we can use, now, the opportunity to secure the adoption by the people generally of economic theories for the husbanding of our exhaustible natural resources, such as coal and other fuels, iron, timber, etc., and we can also bring about now the adoption of policies which will insure the perpetual renewal of even some of the so-called inexhaustible natural resources, such as the soil and its products.

The tendency in any civilization after the struggle to subdue new lands is passed and life becomes less harsh is to seek ease and pleasure and not to put forth such great energy in production. The result is that the demand tends to become greater than the supply; that is, we consume more than we produce. This leads to social dissatisfaction and the moral influences which lead to decay.

INTERCONNECTION PLAN PROPOSED FOR RICHMOND

Fuel Administration Recommends that Virginia Railway & Power Company Buy Surplus of the Municipal Plant

Harry Flood Byrd, Virginia State Fuel Administrator, urges interconnection of the generating stations of the Virginia Railway & Power Company and the city of Richmond. His letter, addressed to the company and the administrative board of Richmond, says:

An investigation by electrical experts discloses that 4,000,000 kw.-hr. of power generated by water without cost by the electric plant owned by the city of Richmond is not being utilized and is being permitted to go to waste. The commercial sale of this power is prohibited under an existing city ordinance. The sale of this surplus power to the Virginia Railway & Power Company will enable the release of an estimated quantity of from 5000 to 6000 tons of coal annually. The city of Richmond will benefit by receiving the fair market prices of the power for which it is not now receiving any return.

The successful prosecution of the war will be advanced by the conservation of the coal saved—no small item—when even now vital war industries are being embarrassed by shortage of coal.

By an intercommunication of this character the city of Richmond will have a surplus of power which may perhaps be the deciding factor in the determination of the government to locate here war industries of an important nature. The shortage of power and coal in the New England States is now so acute that the government recognizes that the future war industries must be established where conditions are more favorable. As a war measure the connection as proposed is of such obvious advantage in making available surplus power now going to waste that the administration confidently expects the cordial co-operation of all parties affected.

The proposed arrangement will only last during the duration of the war. The individuality of each plant will not be disturbed. In view of the conditions as stated above, and following a conference with C. E. Stuart, chief of power and light division, United States Fuel Administration, Mr. Dickerson of the State Corporation Commission and representatives of the administrative board and the Virginia Railway & Power Company, I feel warranted in requesting that the interconnection be established at the earliest possible time.

To settle the financial details involved as between the city of Richmond and the Virginia Railway & Power Company, I suggest a board of arbitration, one member to be appointed by the city of Richmond, one by the Virginia Railway & Power Company, and these two to select the third. If desired, the administration will furnish an expert adviser. In this way, a fair price for the power sold by the city of Richmond to the Virginia Railway & Power Company could be arrived at.

The Fuel Administration will undertake to secure priority orders for the prompt shipment of the transformers and other equipment necessary to establish this connection.

The proposed interconnection in Richmond is earnestly desired by Dr. Garfield, who has been personally consulted and who is familiar with the situation.

Mr. Byrd has also made public a letter from Mr. Stuart pointing out the waste of city energy generated by water power, the seriousness of the fuel situation and the need for all the conservation possible. The government is attempting to centralize such plants, and Richmond is the first Southern city to be approached in the matter. Favorable action in Richmond would be extremely beneficial, Mr. Stuart believed, in having similar steps taken in other cities.

Company officials have indicated readiness to enter into negotiations for purchasing the surplus product of the municipal plant.

Sudden Short Circuits of Alternators—II

Thorough and Critical Exposition of Electromagnetic Phenomena Attending Sudden Short Circuits of Alternators in the Light of Recent Experimental Results—
Practical Methods of Calculating Characteristics

BY N. S. DIAMANT, RICE INSTITUTE, HOUSTON, TEX.

THE phenomena that take place when an alternator is short circuited are such governing factors in designing and operating alternating-current generators, in selecting oil switches and in laying out bus and switching arrangements that every engineer having to do with the generation of power or the apparatus used should have a practical working knowledge of the factors which affect the short-circuit characteristics. Now that larger units are being built and bigger networks are being served the dangers from short circuits are becoming more serious than they ever were.

In the May 18 issue of the ELECTRICAL WORLD a discussion of this subject was started by the author, in which he analyzed the electromagnetic phenomena which take place, considered three-phase sudden short circuits, made a critical analysis of short-circuit equations and gave physical interpretations of sudden short-circuit phenomena. In this issue he concludes the subject by discussing practical methods of determining the different short-circuit constants, single-phase sudden short circuits and the effect of load on sudden short-circuit armature currents.

PRACTICAL METHODS OF DETERMINING THE DIFFERENT SHORT-CIRCUIT CONSTANTS

The damping factors α_f and α_a can be determined experimentally by taking oscillograms of the rise of di-

and $C, C', C'',$ etc., of the armature current as indicated in Figs. 5 and 6. Then¹⁷

$$\frac{FC - I_{RR'}}{F'C' - I_{RR'}} = \epsilon^{\alpha_f \pi} \quad (4)$$

or, approximately,

$$\frac{FO + OC}{F'O' + O'C'} = \frac{FC}{F'C'} = \frac{F'C'}{F''C''} = \epsilon^{\alpha_f \pi} \quad (5)$$

Similarly,

$$\frac{FO - OC}{F''O'' - O''C''} = \epsilon^{2\alpha_a \pi} = \frac{OM}{O''M''} \quad (6)$$

or,

$$\frac{FO - OC}{F'O' - O'C'} = \frac{F'O' - O'C'}{F''O'' - O''C''} = \frac{OM}{O'M'} = \epsilon^{\alpha_a \pi} \quad (7)$$

where $M, M', M'',$ etc., bisect at every point the vertical lines $FC, F'C', F''C'',$ etc. (Figs. 5 and 6).

Applying this method of calculation to a 10,000-kva., 2400-volt, four-pole, 60-cycle alternator,¹⁸ Table III was obtained, in which columns 1 and 2 were measured off directly from the sudden short-circuit oscillogram. Taking the mean of column 5, $\alpha_f = 0.0155$, and from the mean of column 6, $\alpha_a = 0.0565$. α_f for the first cycle, however, is about 0.0244. From the armature current given in Fig. 6, the mean value of $\epsilon^{\alpha_f \pi} = 1.07$, whence $\alpha_f = 0.0215$, and $\epsilon^{\alpha_f \pi} = 1.19$ for the first cycle, whence $\alpha_f = 0.0357$.

The peculiar fact that the attenuation factors and

FIG. 5—SUDDEN SHORT-CIRCUIT FIELD AND ARMATURE CURRENTS OF A PARTICULAR MACHINE UNDER NORMAL EXCITATION

rect current in the field and armature respectively with the machine running at full speed and the secondary dead short-circuited. This method was developed by the author, and so far as tested by him it has given satisfactory results and affords a very convenient and probably a fairly accurate way of determining L and λ . The extent of reliability of this method must, of course, be determined by further practical experience.

If sudden-short-circuit oscillograms are available, the following methods may be used to determine α_f and α_a :

(1) Draw the exponential envelopes $F, F', F'',$ etc.,

especially α_f are larger for the first cycle or two of the sudden short circuit was mentioned before in the first

¹⁷This method was first described by C. M. Davis in the *General Electric Review* for August, 1914, p. 813. It was independently derived and used by the writer, who first gave its mathematical proof (*loc. cit.*, p. 2260). In a semi-graphical description of the method given recently by E. O. Shirley in the *General Electric Review* for February, 1917, p. 121, it is stated that this method of analysis is applicable only to a sudden short circuit at the terminals of the machine, in which case the resistance drop is negligible compared to the reactance drop. This statement is not correct in the opinion of the author. The methods described in the above section are general. The proof of (4) to (5) follows directly from (3) by writing expressions for $F, F', F'',$ etc., and C, C', C'' and adding and subtracting corresponding ordinates.

¹⁸See *Transactions A. I. E. E.*, Vol. 31, "Operating Characteristics of Large Turbo-Alternators," by A. B. Field (Fig. 2).

installment of this article. The explanation of this phenomenon seems to be that at the beginning of the transient period the rate of change of flux is so high and the flux distribution so non-uniform that the effective resistance is higher owing to the larger eddy current losses, while in all probability λ is smaller owing to the greater leakage and saturation and the larger

TABLE III—ATTENUATION FACTORS CALCULATED FROM TRANSIENT ARMATURE CURRENT (FIG. 6)

Ordinates $OF, OF',$ Etc.	Ordinates $OC, OC',$ Etc.	Sum, $OF+OC$ Etc.	Difference, $OF-OC$ Etc.	Ratios of Column 3, $\varepsilon^{a_f\pi}$	Ratios of Column 4, $\varepsilon^{a_a\pi}$
1	2	3	4	5	6
14.4	2	16.4	12.2	1.08	1.22
12.6	2.6	15.2	10	1.05	1.21
11.38	3.1	14.5	8.25	1.05	1.18
10.4	3.4	13.8	7	1.04	1.18
9.6	3.7	13.5	5.9		

induced currents. Thus the increase of r and the decrease of λ would make $\alpha = r/\lambda$ larger for the first few cycles of the short circuit than for the subsequent cycles. Considering the fact that neither r nor λ is absolutely constant, about the only thing that can be done is to employ average values which will give satisfactory results in ordinary practical work. Knowing of the existence of such peculiarities, however, it is possible to introduce them into the calculations as "refinements" whenever accuracy makes it desirable or necessary.

The armature and field attenuation factors can also be calculated from the transient field current by drawing the exponential envelopes $f, f', f'',$ etc., and $c, c', c'',$ etc., as indicated in Fig. 7. Then ¹⁰

$$\frac{fo + co}{f'o' + c'o'} = \frac{f'o' + c'o'}{f''o'' + c''o''} = \varepsilon^{a_f\pi} \quad (8)$$

and

$$\frac{fo - co}{f'o' - c'o'} = \frac{f'o' - c'o'}{f''o'' - c''o''} = \varepsilon^{a_a\pi} = \frac{mc}{m'e'}, \text{ etc.} \quad (9)$$

This method of calculation is illustrated in Table IV,

FIGS. 6 AND 7—SHORT-CIRCUIT ARMATURE AND FIELD CURRENTS WITH ENVELOPES AND COMPONENTS

in which columns 1 and 2 were measured off directly from curve i_f of Fig. 7 and columns 5 and 6 were calculated by means of (8) and (9).

Taking the mean of column 5, $\varepsilon^{a_f\pi} = 1.078$, whence $\alpha_f = 0.023$ and assuming $\varepsilon^{a_f\pi} = 1.125$, then $\alpha_f = 0.0374$. The mean of column 6 gives $\varepsilon^{a_a\pi} = 1.164$, whence $\alpha_a = 0.18$.

It may be noted that this method is independent of the time angle θ_i , at which the sudden short circuit may

occur, while the method involving equations (3) and (4), which gives α_a , fails when θ_i is nearly 90 deg., i. e., when the sudden short circuit occurs near the maximum point of the emf. wave, and the armature current is or becomes symmetrical so rapidly that $(oc - of)$, etc., = 0.

The determination of the attenuation factors is very

36	31	67	5		

important, as is beginning to be recognized, for the following reasons: (1) They permit the calculation, with fair approximation, of the maximum possible short-circuit current, which is important from the point of view of the stresses set up in the alternator; (2) they greatly affect the rate of decay of current and consequently the selection and rating of circuit breakers as was clearly brought out in a recent paper presented at the midwinter convention of the A. I. E. E.¹¹ In this connection it is of interest to consider Table V, which brings together some of the data given in the foregoing pages.

It may be observed from this table that the attenuation factors α_a and α_f are apparently limited to a fairly small range of values, for alternators ranging from 700 kva. to 15,000 kva. For example, α_a lies between 0.07 and 0.044, while α_f lies between 0.01 and about 0.03. The damping factor α_f of small salient pole alternators is, of course, about the same or smaller on account of the high inductance of the field spools, while α_a is larger than that of large turbo-alternators

owing to the comparatively high resistance of the armature.

From the foregoing it would appear that one may be justified in attempting to give representative average sudden-short-circuit characteristic curves of decaying armature currents to cover "modern alternators of normal design." This is done in the paper just referred to, in which it is proposed, quite rationally, to base the selection of oil circuit breakers upon such

¹⁰The proof of this follows directly from equation (2) by writing the equations of the envelopes and adding and subtracting corresponding ordinates.

¹¹"Rating and Selection of Oil Circuit Breakers," by Mahoney and Burnham, *Proceedings A. I. E. E.*, February, 1918. Also *ELECTRICAL WORLD*, February 23, 1918, p. 43.

average curves. However, considering the fact that Table IV is not so accurate and complete as might be desired, and further considering the large damping effect which will be caused by a comparatively small increase, up to a certain value, in α_a and α_f , it is well to exercise a little caution in the use of such average curves to apply to all modern alternators.

SINGLE-PHASE SUDDEN SHORT CIRCUITS

The principles involved in single-phase sudden short circuits are identical with those given for three-phase alternators, so that fundamental equations may be set up and expressions obtained for the field and armature currents in a similar manner. However, as the algebra involved in the solution of the equations is tedious and complicated, it will not be given here, but attention will be called to the following facts:

1. The double-frequency armature reaction superim-

FIG. 8—SINGLE-PHASE SUDDEN SHORT CIRCUIT OF A 37.5-KW., 240-VOLT, 60-CYCLE ALTERNATOR AT NORMAL VOLTAGE AND SPEED

First wave—field current; second wave—armature current (note peaked appearance of the individual half waves as compared with those of Fig. 7, which, though taken on a different machine, are very similar in wave shape and smoothness to the three-phase sudden short-circuit current waves obtained with this alternator); third wave—armature voltage; second straight line from bottom—calibration curve (113 amp. direct current).

poses a double-frequency alternating current on the field current, which is made up of three components just like the three-phase sudden short circuit. This fourth double-frequency component, of course, persists during the sustained short circuit (Fig. 8).

2. The decaying direct current, I_{adc} (Fig. 4a), due to the change of flux in the armature, produces an alternating current of fundamental frequency in the field. This added to the double-frequency pulsation mentioned under (1) makes the alternate crests of the double-frequency component unequal, as clearly illustrated in Fig. 8. However, if the sudden short circuit happens to occur at $\theta_1 = 90$ deg.—i. e., at the maximum point of the emf. wave—then, as already explained, i_{adc} will be zero and thus the crests of the pulsating double-frequency current will be equal.

3. The armature current is more peaked, or in general the individual half-waves appear to deviate more from a sine wave, in case of a single sudden short circuit than in case of a three-phase sudden short circuit. This seems to be true more of some machines than others, and in case of wave shapes of armature current like the one illustrated in Fig. 8 it is fairly clear that the peaked appearance of the half-waves is due to the presence of a third harmonic. This third harmonic is no doubt caused by the double-frequency pulsation in the field. Theoretically, as already explained, the second, fourth, sixth, etc., even harmonics should be present in the field and the third, fifth, etc., odd harmonics in the armature. However, experience shows that in

ordinary work the harmonics higher than the third are negligible.

4. According to the experience of the author and others, it appears that the methods of calculation outlined in the first part of this article are applicable to single-phase sudden short circuits despite the fact that the armature and field current equations are rather long and complex.²¹

EFFECT OF LOAD ON THE SUDDEN SHORT CIRCUIT ARMATURE CURRENT

According to the theory developed in the foregoing, it should be quite clear that the load carried by the machine before a sudden short circuit will affect the arma-

ture current only in so far as it affects the amount of flux existing in the armature and field before and after the sudden short circuit. Thus for a given terminal voltage the armature current will be larger for a heavy inductive load than for no load in the proportion in which the flux in the machine (not the field excitation) or the generated internal emf. is larger in one case than in the other. In short, the transient armature and field currents are affected only indirectly by the field excitation existing at the instant of the sudden short circuit and depend directly upon Q_{adc} and Q_{fdc} (Fig. 4), which in turn depend upon the difference of the flux before and after the sudden short circuit.

This theoretical conclusion has been corroborated experimentally by the writer and others, and it has furthermore been found that the increase of armature current due to load is relatively unimportant in small alternators having high resistance in the field and armature, but becomes more important in case of large turbo-alternators having comparatively low resistance in the field and armature. A little consideration will show that this is as might be expected, since, for a given change in flux, Q_{adc} and Q_{fdc} (Fig. 4) are inversely proportional to the resistances r_a and r_f respectively.

Wages in Shipyards

The Shipbuilding Labor Adjustment Board has announced a schedule of minimum wages for labor in steel shipyards in the Great Lakes region. Here follow the wages, in cents per hour, for the electrical department: Electricians, first class, 70; electricians, second class, 65; wiremen, 55; joiners, 70; machinists, first class, 72½; helpers, 46.

Present Status of Brass Melting—I

Fundamental Principles Upon Which Success of Electric Melting Depends—Relative Merits of the Different Types of Furnaces That Are Now Upon the Market—The Central-Station Viewpoint

BY H. M. ST. JOHN

Commonwealth Edison Company, Chicago

IF ALL of the brass and bronze produced in the United States were to be melted in electric furnaces, the annual consumption of electrical energy for this purpose would be in the neighborhood of 200,000,000 kw.-hr. and the generating capacity required to supply the necessary power would be about 75,000 kw. There is little reason to expect the complete electrification of this industry, either now or in the future, but the expansion in this field which may reasonably be predicted will be sufficiently large to be interesting to the central-station companies.

The central station not only has an object in promoting the satisfactory progress of this development, but it has at stake interests which can be protected only by a constant oversight of such features of the development as directly concern itself. For example, the success of the central-station company depends upon the proper selection and correct use of the customer's equipment, since the customer's use of the company's service cannot possibly be satisfactory if its method of application is faulty. This may be a matter of minor importance in so far as it concerns the use of motors and other well-standardized equipment, but it is a matter of great importance when it involves new electrical devices or new processes which are not well understood and are, perhaps, entering the industrial world in a somewhat crude and undeveloped form.

Certain fundamental principles, upon which the success of electric brass melting directly depends, have hardly received, at least in public, the consideration which they deserve, and they will be discussed in this paper. In discussing them particular attention will be called to the bearing which they have upon electric furnace design and development.

In 1914 it was estimated by Gillett¹ that there were in the United States at least 3600 plants engaged to some extent in melting brass and bronze. It was further estimated that the value of the metal annually melted by these plants was in the neighborhood of

\$120,000,000, and that of this total the value of the metal lost beyond recovery during the melting operation was not less than \$3,000,000. When one considers the extensive use of brass and bronze in warfare and the enormous industrial expansion along metallurgical lines which has taken place in this country since 1914, it should be evident that corresponding figures for the

present time are much larger. Even if the total amount of metal melted annually were no greater now than then, the increase in market value of the metals concerned would of itself nearly double the value of the metal produced. The avoidance of waste in melting, which was even then considered important, therefore becomes particularly so at this time.

As has long been known, it is theoretically possible to eliminate much of this loss by the use of electric melting, particularly in the case of yellow brass and other alloys high in zinc. Most of the electric furnace development in the copper-alloy field has been carried out with this end in

THE CENTRAL STATION'S OPPORTUNITY

The central-station industry has something to gain by the successful development and use of electric furnaces; it has something to lose by their failure. It is in a position to protect this interest if it cares to do so. The central-station company can, by virtue of a little effort, inform itself quite fully concerning the possibilities of electric furnace application within its territory. It can, in a similar way, make itself familiar with such requirements of its customers as have a bearing on electric furnace use. It will then have a wider knowledge than its customers of the electric furnace situation at large; it will have a more detailed knowledge of electric furnace possibilities and requirements within its territory than has the electric furnace salesman. By proper use of this knowledge and of such influence as it ought to possess in the industrial community which it serves the central-station company can promote well advised applications, prevent misapplications, point the way to correct use, discourage incorrect use, and insure profitable development, within its field of operations, of that newest of electric load builders, the electric furnace.

view. Metallurgically speaking, the problem is not a simple one and progress has been rather slow. Important advances have been made since 1914, however, and the present outlook is rather optimistic.

Two widely different types of electric furnace are now on the market and in commercial use for melting yellow brass. One is highly efficient but limited in its use to a portion of the field only; the other is less efficient but otherwise more widely applicable. At least one other type of furnace has been experimentally successful and is reported as about to enter the commercial field. Two or three additional types are being actively developed and give some promise of eventual success.

So far as yellow brass is concerned, it cannot be said that an entirely satisfactory furnace has yet been produced, but the field has been partly covered, and the prospects for further advancement in the art are good.

Previous to the war the use of electric furnaces for melting copper alloys did not seem feasible except in cases where a large metal saving helped to counterbalance the higher cost of electric heat. Under present

¹H. W. Gillett, "Brass-Furnace Practice in the United States," *Bureau of Mines Bulletin No. 73*, p. 9 (1914).

conditions the high cost and poor quality of crucibles, the high cost and shortage of important metals, the high cost and scarcity of labor and the insistent demand for a high rate of production at any cost are factors which combine to make electric melting profitable in many cases where it would previously have been unprofitable. Whether electric furnace installations which owe their existence to these peculiar conditions will continue to show a profit when normal conditions once more prevail is still an open question. No one can say when conditions will again become normal, or, for that matter, what sort of conditions will be considered normal in the future. Much will depend upon the progress made in furnace design and in operating methods during the continued existence of the economic conditions which at present make possible the electric melting of copper alloys containing little or no zinc. The necessary progress can only be made by the combined efforts of such individuals and companies as are now profiting, and expect to profit in the future, from the increased use of electric furnaces.

ADVANTAGES OF ELECTRIC MELTING

Electric heat is expensive at best, and although it can be applied much more efficiently than heat derived from fuel, especially at high temperatures, it cannot profitably be employed except in cases where its use makes possible substantial savings of one kind or another to offset its added cost. The advantages which may naturally be expected to accrue from electric melting, as compared with melting in fuel-fired furnaces, are roughly as follows:

Metal Saving.—The saving of metal otherwise unavoidably lost is the principal economic advantage which the electric furnace is required to show in the melting of copper alloys, particularly in melting yellow brass. It has been completely demonstrated that such a saving can be made in the electric furnace by virtue of the fact that the furnace chamber can be tightly closed during the melting period and a neutral or reducing atmosphere maintained. As will be shown later on, it does not follow that every electric furnace is capable of a favorable performance in this respect. Conditions resulting from the war have greatly accentuated certain other advantages of electric furnace operation, but in more normal times no electric furnace can be expected to succeed in this field unless its use results in a saving of metal as compared with fuel-fired practice.

Improved Quality.—It has been found in most cases that a more uniform quality of metal can be produced in the electric furnace than in fuel-fired furnaces operating under similar conditions and that it is easier to produce an alloy of closely specified composition. In general, these advantages can be accepted as inherent in properly conducted electric furnace operation, resulting from the greatly reduced loss of volatile metals and from the elimination of contaminating combustion gases. So far as copper alloys are concerned, it is still undecided whether or not a higher quality of metal can be produced in the electric furnace as compared with the best of fuel-fired practice. It is beyond question, however, that high quality can be achieved more easily and with greater certainty. The successful electric furnace must be at least as satisfactory in these respects as the best fuel-fired furnace.

Exact Temperature Control.—The production of per-

fect castings, with the least possible number of defective pieces, depends in large degree upon the use of metal at a temperature which conforms closely with that known to be most favorable for the work in hand. The electric furnace lends itself readily to exact temperature control, which is an important advantage.

Increased Production.—In general, the speed of melting is greater in electric furnaces than in fuel-fired furnaces, because of the higher operating temperature and greater efficiency obtained. Furthermore, larger units can usually be employed than when fuel-fired furnaces are used.

Elimination of Crucible Cost.—The cost of crucibles is an item of considerable magnitude even in normal times. Under present conditions this cost is very high. Electric furnaces, which require no crucibles, therefore eliminate this expense. Large fuel-fired furnaces effect the same saving, but from a metallurgical point of view are seldom as satisfactory as fuel-fired crucible furnaces. Electric crucible furnaces deserve little consideration at the present time.

Incidental Savings.—The operation of large units results in an economy of floor space and labor, and increased production is attended by decreased overhead and interest charges per ton of metal produced.

Better Working Conditions.—More favorable conditions for the workmen, tending to increase their efficiency as well as their comfort, result when excessive heat, noise and fumes are eliminated. Properly selected and correctly operated electric furnaces are almost ideal in this respect. In installations where the reverse is true the trouble is due to the use of an unsuitable furnace, or to careless operation, or to both of these as contributing causes.

It should not be understood that these advantages necessarily follow from the use of any electric furnace which may happen to be selected. The furnace must be of suitable type, properly designed and correctly used. A misapplied electric furnace may prove worse in almost every respect than the fuel-fired furnace which it replaces.

First consideration must always be given to metallurgical requirements. Steel may be heated as rapidly as desired during the melting operation, provided that it is not exposed to contaminating elements during the process, but with copper alloys the case is quite otherwise. Copper is somewhat volatile and oxidizes much more readily than steel when in the molten state. Lead is also quite volatile, more so than copper, and oxidizes very easily. Zinc is exceedingly volatile at molten brass temperatures. All copper alloys must be treated carefully during the melting process in order that losses of metal by oxidation and volatilization may be kept at a minimum.

REQUIREMENTS OF ELECTRIC MELTING

Yellow brass for thin castings must be poured at a temperature not far below its boiling point in order that the metal may be sufficiently fluid. At this temperature zinc, which comprises 30 to 35 per cent of the alloy, has a tendency to vaporize rapidly. So long as the metal is contained in a tightly closed furnace chamber, which can easily be done in the electric furnace, this tendency is counterbalanced by the vapor pressure of the metal which has already been vaporized and with which the furnace atmosphere is saturated. When the

furnace is opened for pouring the metal or for any other purpose the vapor pressure is released and additional zinc will escape from the metal without restraint. If the heating has been perfectly uniform and all portions of the melt are at approximately the same temperature, the loss of zinc which ensues will constitute an unavoidable minimum. If the heating has not been uniform, some portions of the melt will be at a temperature higher than the desired pouring temperature, and such portions will lose zinc at a higher rate. If the lack of temperature uniformity is very great, the loss which occurs after the furnace is opened and during pouring will be decidedly excessive. In fact, some portions of the metal may be so seriously overheated during melting that the high vapor pressure formed within the furnace will force considerable quantities of zinc vapor through crevices in the furnace structure. In some cases it may be practically impossible to keep the furnace chamber closed, even to a reasonable degree. Under such conditions the zinc losses are likely to be quite as serious as in fuel-fired crucible furnaces, or even more so.

What is true of yellow brass poured at a temperature near its boiling point is also true, although in less degree, of yellow brass poured at lower temperatures and of other copper alloys. The lower the percentage of volatile metal the more easily the alloy will withstand uneven heating, but it can be accepted as an axiom of copper alloy melting that heat must be applied to the metal as uniformly as possible, whether the alloy under treatment is brass, bronze or some one of the less common alloys. If the application of heat in the furnace lacks uniformity to a serious degree, an excessive loss can only be prevented by some method of stirring the metal, and this stirring must be effected within the furnace, but without opening the furnace doors.

The metal as poured from the furnace must be uniform in composition, with its various constituent metals thoroughly well mixed and alloyed. In some cases a rigidly specified composition must be closely met. The finished casting or ingot must be of a quality at least as good, with respect to strength, freedom from cracks, blow-holes, etc., as that obtainable from fuel-fired crucible furnaces.

Since electric heat is more costly than that derived directly from fuel, it is important that the thermal efficiency of the electric furnace should be as high as can be obtained consistently with other requirements. A high thermal efficiency in electric melting, unless heat is generated in the metal itself, requires a high temperature heat source, placed as close as may be to the metal, under conditions which offer the least possible opposition to the flow of heat from the source to the metal. At the same time the walls of the furnace must be sufficiently thick and of high-heat-insulating quality in order that heat may not be dissipated uselessly from the outer walls.

In some types of furnaces these requirements are directly opposed to the metallurgical requirements already considered. In such cases thermal efficiency must be sacrificed to as great a degree as may be necessary in order to satisfy the metallurgical requirements. The highest efficiency consistent with good metallurgical results should be maintained; any higher efficiency is false economy. Of course, other things being equal,

the more efficient type of furnace will meet with greater success.

The electric furnace, to reap the full benefit of its economic possibilities, must operate in large units and must not use crucibles. The higher its speed of melting the better, so long as speed is not detrimental to metallurgical results.

The electrical characteristics of the furnace must be such as to make it a desirable load for the central-station company or the factory power plant. Its power factor must not be abnormally low and its power fluctuations must not be so violent as to endanger transformers and other electrical equipment or to interfere with satisfactory service to other customers of the central-station company that may be connected with the same power line.

It hardly seems necessary to add that the successful electric furnace must be sturdy and reliable, quite as capable of performing its function, day in and day out, under regular operating conditions, as are the best types of fuel-fired furnaces. The furnace and its adjustments should be as simple as possible, although with a large electric furnace it is permissible, and nearly always desirable, to use a higher grade of operator than would be employed to tend fuel-fired crucible furnaces.

A great variety of electric furnace types have been proposed and tried out for melting brass. It is hardly an exaggeration to say that every known method of applying electric heat to a metal has been utilized by one or another of the various designs which have reached at least an advanced experimental stage. Some of these types have been eliminated as inherently unsuited for the purpose; some have been abandoned because of difficulties which may eventually be overcome by other investigators; others, partially successful, have apparently reached the height of their development; still others seem to possess greater possibilities of ultimate success than have yet been demonstrated.

This article will be concluded in a coming issue, where the different types of furnaces will be described.

ORGANIZING INSPECTION TO INSURE CLEAN COAL

Stringent Measures Are Taken by the Fuel Administration to Prevent the Shipment of Fuel Mixed with Dirt

To guard against the waste and serious loss resulting last winter from the shipments of dirty coal, which occupied car space and also seriously decreased industrial plant efficiencies, the Fuel Administration has organized a division of inspection, with C. M. Means as manager. A chief inspector has been appointed in each of twenty-one representative districts and where necessary assistant inspectors will be added. These inspectors will examine coal in the mines, also that dumped from mine to tipple, watch the picking tables, and again inspect the coal as it is loaded in cars for shipment.

Standards will be established for insuring proper preparation according to use, so that all coal shipped must be of the quality required for its particular purpose.

The New Westinghouse Research Building

Description of Laboratory Structure Specially Designed to Facilitate Working Out the Many Problems in Research That Constantly Arise—One of Seven Laboratories in the Company's Engineering Department

BY C. E. SKINNER AND R. W. E. MOORE

THE research work of the Westinghouse Electric & Manufacturing Company has always been carried on under the direction of the engineering department. In 1906 the research division was organized as one of the several divisions of the engineering department, and it now has under its control seven laboratories.

The work of the division includes activities which are not usually classed as research work in other organizations. For example, it has charge of the preparation of all specifications for the purchase of the materials used by the company, together with the experimental and development work leading up to the writing of these specifications. It includes a process section, which has technical control of all the various processes used by the company in the manufacture of its product. It has charge of the routine chemical and physical testing for all departments, including the inspection department. It has technical control of the various metallurgical processes, such as those involved in the brass foundry, copper mill, scrap-recovery plant, etc. Through the activity of its members on various standards and other committee work it comes into contact with numerous activities not strictly of research nature both within and without the organization.

SEVEN LABORATORIES NOW ORGANIZED

The laboratories under the control of the division are the chemical laboratory, the physical testing laboratory, the process laboratory, the electrical laboratory, the molded-materials laboratory, the ceramic laboratory and the research laboratory. The latter is housed in what is commonly known as the "new research building." In accordance with the general organization plan of the engineering department of the company, the research division is divided into sections, each with a section head, reporting directly to the division engineer. The growing demands for more fundamental work made it desirable to provide a special building where advanced and new research problems could be better separated from the more insistent works problems. A location about a mile distant from the works was selected, partly on account of the crowded condition in the vicinity of the works, but more especially to secure a site relatively free from vibration, dirt and noise and which would afford a certain amount of isolation.

Architecturally, the building is plain but substantial. It is of reinforced concrete and brick, trimmed with white terra cotta. In its design special attention was given to the means of running pipe and wire services in such a way as to enable these services to be brought into any laboratory when needed, without disturbing any other part of the building.

The power house contains motor-generator sets for supplying single-phase, two-phase and three-phase current at 220 volts, and direct current at 250 volts (three-wire circuit). A motor-driven air compressor supplies

compressed air at 125 lb. pressure (8.75 kg. per sq. cm.) and a large motor-driven vacuum pump supplies the necessary house vacuum. A liquid air machine capable of supplying 1½ l. to 2 l. of liquid air per hour is also installed in the main power house. The storage battery is in a separate room in the basement of the power house and consists of a total of 218 cells, so divided that various groupings and combinations may be obtained.

In one end of the basement is the furnace room with a battery of electric furnaces of various types, together with the necessary control for melting, annealing and various metallurgical processes. Stacks are provided at each end of the building, with openings in the basement, for experimental furnaces using fuel, usually natural gas. The woodworking and metal-working shop and storeroom are also in the basement. On the first and main floor are the main and private offices, the library and the conference room. The remainder of this floor is assigned to physical, electrical and magnetic research. The second floor, which is not entirely finished, will be given over to the same general class of work as the first floor. The third floor is devoted to chemical and electrochemical research, illumination laboratories and a glass-blowing room.

The manufacture of electrical machinery and apparatus as carried on by the Westinghouse Electric & Manufacturing Company is perhaps one of the most complicated of businesses, and consequently, research problems of a very large variety are constantly being brought to those in charge of its research work. Facilities for such research must, of necessity, include provision for many lines of work, such as magnetic insulation, metallographic metallurgy, chemistry, both organic and inorganic, together with combinations.

PRESENT AND FUTURE ACCOMPLISHMENTS

While this new laboratory has been occupied for only a comparatively short time, the work already accomplished gives much promise for the future. It is, of course, intended that the fundamental and advance work shall be carried out in this section of the research division and that the application work of the processes and products developed shall be carried out by the respective sections having more intimate contact with the works departments. Being under one management, men can be readily transferred from the more commercial sections to the research laboratory section or vice versa as the exigencies of the case demand. In this way, for example, a research man developing a new process for the control of some metallurgical operation can follow this up to the point of commercialization in the factory itself, still being a member of the research division. The scheme of organization above described insures the co-ordination of the various sections of the research division and the best possible co-operation of the research division with the other engineering divisions and the works departments.

Economic Aspects of Summer Load—II

Features of a Class of Service Which, When Properly Handled, Yields Profitable Revenue and Exerts Great Influence in the Popularization of Electricity—How Power Business Grows in the Hot-Weather Term

COMPARISONS of revenue earned by central stations from month to month with their changing peak loads and output variations throw considerable light upon the economic problem which companies face when supplying business of a higher seasonal character. Within a few months the Maine Public Utilities Commission had occasion to pass upon the equity of seasonal rates in the Old Orchard district, served by the York County Power Company, affiliated with the Cumberland County Power & Light Company of Portland.

At Old Orchard the York County company charged its year-round customers for energy, furnished under the same specifications as those governing its seasonal rate E, 9 $\frac{1}{4}$ cents per kilowatt-hour, with a minimum charge of \$12 per year. The seasonal rate itself, applying to customers taking service for four months or less per year, between June 1 and Oct. 1, was 20 cents per kilowatt-hour for the first 100 kw.-hr. per month, 10 cents per kilowatt-hour for all in excess, and a minimum charge of \$2 per month. The petitioners to the board claimed that the seasonal rate was too far in excess of the yearly rate to be equitable.

The accompanying diagram (Fig. 10) typifies the load conditions in the Old Orchard district. It is supplied from Biddeford over an 11,000-volt line, and were it not for the summer peak, the Old Orchard district load could be handled at 2300 volts. The variations of the input to the Old Orchard substation show that the peak load of the year came in August, the monthly input then being about 61,500 kw.-hr., compared with a December input of 10,200 kw.-hr. The total receipts from the Old Orchard district are about \$25,000 per year, of which the out-of-season business (October to May inclusive) represents about \$5,600. The number

in order to meet the winter demand was only 50 kw.

From the evidence it appears that the revenue from the seasonal business totaled \$19,400 for four months, or an average of \$4,850 per month; that 390 kw. more capacity had to be maintained to handle this business in summer, and that the summer business alone yielded \$12.43 per kilowatt of plant capacity per month, but prorated over the entire year the extra capacity required for the summer service yielded only \$4.15 per annum per kilowatt of plant capacity. The off-season revenue of \$5,600, on the other hand, was gained in eight months from an active capacity of 50 kw.; in other words, this capacity earned \$14 per kilowatt of capacity

FIG. 10—LOAD CONDITIONS FOR TWELVE-MONTH PERIOD AT OLD ORCHARD BEACH, ME.

per month of off-season service, and two-thirds of this, or \$9.34 per month, the year through. In this case, therefore, it would seem that the year-around business is easily more than twice as valuable from the plant investment standpoint as the summer business, or, put-

HOW POWER BUSINESS AT SHORE RESORT GROWS IN SUMMER SEASON

	Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.

6. Revenue, power	\$521	\$838	\$680	\$1,036	\$1,600	\$3,210	\$3,060	\$2,969	\$2,160	\$634	\$793	\$812
7. Revenue, lighting	\$16,582	\$13,416	\$12,283	\$13,466	\$12,934	\$15,045	\$15,831	\$16,012	\$16,641	\$13,937	\$15,095	\$16,904
8. Peak load, maximum kw.	950	910	1,300	1,350	1,700	1,750	1,800	1,900	1,850	1,150	1,070	1,375
9. Station rating, kw.	2,900	2,900	2,900	2,900	2,900	2,900	2,900	2,900	2,900	2,900	2,900	2,900
10. Average revenue per kw.-hr. sold, cents, approximate	7.9	8.2	7.9	6.3	8.3	7.6	7.7	7.5	7.8	7.9	8	7.8

of customers varied from 943 in August to 285 in January. The peak load in the Old Orchard district (not including the entire 11,000-volt feeder from Biddeford) required a capacity of 440 kw. to be maintained during the summer, whereas the approximate capacity required

ting it in another way, the summer business is probably less than half as desirable in relation to plant size as the year-around service. Nearly eight times the plant rating has to be carried through the year because of the summer business handled in four months or there-

abouts that would be needed without this relatively costly service. The August output was about six and two-thirds times the highest non-seasonal output. The connected load of the Old Orchard district varied from 322 kw. in January to 1071 kw. in August.

In considering this case the commission recognized that if the cost per unit of service, owing to the distribu-

the Old Orchard, Kennebunkport and York Harbor districts, or by \$1,677 in the Old Orchard district alone.

A comparison of the revenue from electricity sales by months in a New England central station serving a coastwise town which has a large year-round population and which contains one of the most popular shore resorts in that part of the country is shown in Fig. 11.

FIG. 11—COMPARISON OF CENTRAL-STATION MONTHLY REVENUE IN COASTWISE TOWN INCLUDING SHORE RESORT

tion of capacity and organization expenses over a shorter period, is substantially greater than the cost per unit to twelve-months-per-year customers, it must affect the whole cost of the company's operations too seriously for it fairly to be absorbed in the charges to the year-around customers. The commission found this to be "clearly a case where the summer customers ought

Curves are also plotted showing the variations in peak loads on this plant by months and the revenue per kilowatt of peak load. The base data from which these curves are plotted are given, with other information of a comparative nature, in the table. In Fig. 12 are plotted the daily peak loads of this plant for an entire year. On this system the peak load occurred in August, and

FIG. 12—ONE YEAR'S DAILY PEAK LOAD, IN KILOWATTS, OF PLANT REFERRED TO IN FIG. 11

to bear the extra cost of serving them." The commission came to the conclusion that 20 cents was too high a charge for the use of the lesser amounts of energy during the seasonal period, in comparison with the 9¼ cent rate furnished year-around customers. A maximum rate of 15 cents was established, and it was estimated that this would reduce the revenue by about \$6,073 in

reached 1900 kw., the maximum low-month peak being about 910 kw. and occurring in February. The capacity of the plant was 2900 kw. throughout the year. It will be noted that the revenue per kilowatt of peak load per month fell from \$18 in January to an average of about \$10 during the summer months. The revenue per kilowatt-hour was also somewhat less in the summer

season than at other times of the year. There is not so much difference in the case of this company as in some others between winter and summer rates, on account of the winter population, but the presence of a great amusement resort with a large amount of display lighting and power in the town increases the output materially in the summer. It will be noted that the kilowatt-hours sold from month to month varied in a general way in accord with curve of peak loads. The summer power business of concessionnaires at the shore resort is largely responsible for the great increase in power sales in the summer period, shown in the table, compared with the winter sales. The season is longer here than in many places at the shore, outline lighting of pavilions beginning even in April and extending well

TEN YEARS' RECORD OF PUBLIC UTILITY EARNINGS

Gratifying Increase in Gross Earnings, Say Harris, Forbes & Company, Is Incomplete Showing Unless Net Earnings Are Given

For some years past, Harris, Forbes & Company, New York, have prepared annually a tabulation of the earnings of the public utility companies whose bonds or notes they handle. They have received reports for 1917 from 100 companies covering in their operations territory in thirty-nine states of the United States and in two provinces of Canada. These show a total average increase for the 100 companies of 10.3 per cent in gross earnings. This is a larger percentage of increase than

FIG. 13—CURVES OF MONTHLY PEAKS AND REVENUE FOR ATLANTIC COAST CENTRAL STATION

into the fall. The revenue shows no serious falling off until October. On account of the substantial year-round residential population which commutes to adjacent industrial cities, the winter revenue is larger than in many central stations serving shore resorts. Even with the stabilizing influence of this permanent population as a market for energy, however, the summer business involves a plant capacity of about 1000 kw. in excess of that needed for winter use.

Fig. 13 shows the curves of monthly peaks and revenue for a central station serving a group of diversified communities along the Atlantic Coast. In this case the ratio of revenue to load changes very little from month to month. The yearly peak occurs in September. The summer user is charged a net rate of 16 cents per kilowatt-hour for the first 300 kw.-hr., and the all-year rate is 14 cents net. Seasonal customers pay a minimum charge of \$6 per meter for the season, and yearly customers pay a minimum charge of \$1 per month. In this case there is probably not great enough difference between the year-round and summer populations taking service to impose the marked difference in seasonal service cost which can be recognized in such a community as Old Orchard Beach, in Maine. The revenue per kilowatt peak was \$12.80 in January and \$11.40 in September.

Radio Inspectors Needed by Government

The United States Civil Service Commission announces an open competitive examination for radio inspectors at entrance salaries from \$1,200 to \$1,600. Applicants should apply for Form 1312 to the federal commission or to the local boards where such exist.

the average during the past ten years, as will be seen from the following summary of gross earnings:

	P. C. of Inc.
60 companies, 1908 over 1907.....	7.3
61 companies, 1909 over 1908.....	11.3
66 companies, 1910 over 1909.....	12
70 companies, 1911 over 1910.....	9.3
73 companies, 1912 over 1911.....	8.6
83 companies, 1913 over 1912.....	7.4
84 companies, 1914 over 1913.....	2.9
86 companies, 1915 over 1914.....	2.8
90 companies, 1916 over 1915.....	10.4
100 companies, 1917 over 1916.....	10.3

Commenting on these results, the bankers say:

"It will be observed that the foregoing record shows uninterrupted annual increases in the aggregate gross earnings of these companies during the past ten years, the average annual increase being over 8 per cent. In normal times this tabulation alone might serve as an illustration of the stability of earnings of the well established public utilities. Under present conditions, however, the statement is incomplete without the facts as to net earnings. These companies, in common with practically all others, have been confronted during the past year with the problems of increasing costs of labor and material and higher taxes. It is therefore most gratifying to us that the aggregate net earnings of the 100 companies from which we have received reports show a falling off during 1917 as compared with 1916 of less than 2.8 per cent. Furthermore, the aggregate 1917 net earnings amounted to over two and three-quarters times the aggregate annual bond interest charges of these companies. We feel sure that this showing of earnings under adverse conditions is one of the most dependable indications of the desirability of public utility bonds for investment when selected with care."

Protective Lighting for Industrial Plants

Discussion Regarding the Intensity and Distribution of Illumination Required, Avoidance of Glare, Available Units and Most Desirable Methods of Installation

BY DAVIS H. TUCK

Electrical Engineer, Holophane Glass Company

AT THE present time, when industrial plants are working night and day turning out the enormous quantities of material required by the government for the successful prosecution of the war, it is necessary not only to illuminate the interior of the plant to conform to recommended practice but it is often of

equipment which meet the requirements within varying degrees of practicability.

Fundamental Principles.—The fundamental principles of scientific illumination apply to exterior lighting as they do to interior lighting. They are these: (1) The intensity of illumination must be adequate; (2) the illumination must be uniform; (3) glare must be minimized. The details of design of lighting units and the

FIGS. 1 AND 2—COMPARATIVE AREAS ILLUMINATED EQUALLY BY FOUR TYPES OF EQUIPMENT USING THE SAME WATTAGE PER UNIT, AND THE RELATIVE ANNUAL COSTS* OF LIGHTING EQUAL AREAS EQUALLY USING THE FOUR TYPES OF EQUIPMENT

advantage to light the yards so that the workmen may see to pass from one building to another and to perform rough manufacturing work in the yards. With the large number of enemy fanatics at large, it is often

FIGS. 3A AND 3B—PRISMATIC-REFRACTOR UNIT WITH DISTRIBUTION CURVE IN VERTICAL PLANE

necessary to install a system of protective lighting that will enable the guards to apprehend the evildoers.

Although this field of lighting is relatively new in its demands, and although practice has not been standardized, there are fortunately several types of lighting

*Cost includes interest on investment, depreciation, maintenance and power cost.

poses, such as loading cars, shipbuilding, etc., an illumination intensity of 0.5 ft.-candle to 2 ft.-candles is advocated.

It is to be noted that at night the eye requires less illumination for equal discerning power than during the daytime. With the sky and surroundings comparatively dark the eye is adapted to a lower order of bright-

FIG. 4—RELATION BETWEEN MOUNTING HEIGHT AND LOSS OF LIGHT DUE TO GLARE

methods of installation are, however, somewhat different.

Adequate Intensity.—The intensity of illumination that is required is dependent upon the purpose for which the exterior illumination is intended. For ordinary yard lighting, where no work is performed and where the purpose of the lighting is only to enable workmen to pass from building to building, 0.025 ft.-candle to 0.05 ft.-candle is recommended. For an adequate system of protective lighting, from 0.05 ft.-candle to 0.2 ft.-candle is recommended. For yard lighting for working pur-

ness, and a relatively feeble stimulus will therefore produce effects equal to those produced by much greater stimuli during the day time.

Uniform Illumination.—It would seem that the fact that the illumination should be uniform would be self evident. Yet there are many yard-lighting installations

FIGS. 5A AND 5B—FLOODLIGHT PROJECTOR WITH DISTRIBUTION CURVE* IN VERTICAL PLANE

in use where the ratio of maximum to minimum is 300 to 1 or greater. It is evident that if the maximum illumination is adequate the minimum will be inadequate and vice versa. If both the maximum and minimum illumination are adequate, then there is a gross waste of energy and an unnecessarily large investment to carry. The maximum service for the minimum expenditure demands uniform illumination.

The silhouette method of yard lighting is of little avail for working or protective purposes. When an object is seen by silhouette effect only its outlines are visible and not its surface details or characteristics. These can be seen only by illumination effect. In the yard of an industrial plant there are usually many obstructions, such as cars, buildings, piles of material, etc., which offer vertical surfaces against which the contrast of a trespasser is indistinguishable. To provide for safety from attack it is highly important not only to see a person but to recognize the facial and other characteristics which suggest the evildoer. Unless a man has some well-known peculiarity of figure or gait, he cannot be recognized with silhouette lighting.

Glare.—Glare must be minimized. Glare is the result of a light source directly in the field of vision that is extremely bright when viewed in comparison with its surroundings.

It is very important that the yard-lighting system shall produce an effect which will surround those working in or patrolling the yards with conditions under which the eye is free to perform its functions properly.

FIGS. 6A AND 6B—PORCELAIN-ENAMELED REFLECTOR UNIT WITH DISTRIBUTION CURVE IN VERTICAL PLANE

Any system which fails in this respect is an extravagant system, no matter how efficient the lamps nor how efficiently the light may be directed upon the yard surfaces or objects. Glare serves seriously to reduce

the discerning power of the eye. Details and more distant objects can be equally well seen at much lower illumination intensities and hence at much lower costs when glare is avoided. Certain popular types of present day yard and protective lighting involve such a degree of glare that equally satisfactory vision would be possible with one-third of the light if the glare were eliminated. The one practicable method of minimizing glare is to mount the units high so as to be out of the ordinary range of vision.

Available Units.—For purposes of protective and yard lighting four general types of equipment are in use:

1. The refractor unit, which gives a very broad, symmetrical light distribution and will uniformly illuminate areas when the units are spaced from eight to twelve times the mounting height (Fig. 3 a and b). In this and the following figures the use of a 500-watt gas-filled lamp is assumed.

2. The flood-light projector, which gives a concentrated beam of about 10 deg. to 20 deg. in a single direction and is adapted for the illumination of relatively small areas in inaccessible places, such as bridge piers (Fig. 5 a and b).

3. The porcelain-enameled reflector, which gives a relatively extensive distribution but which has its maximum candlepower beam at angles near the vertical (Fig. 6 a and b).

4. The opal globe, which gives a distribution similar to the porcelain-enameled reflector (Fig. 7 a and b).

FIGS. 7A AND 7B—OPAL-GLOBE UNIT WITH DISTRIBUTION CURVE IN VERTICAL PLANE

Comparison of Available Units.—The most equitable basis for comparing exterior lighting equipment is that of maximum service at minimum cost. Fig. 1 shows diagrammatically the relative areas equally illuminated, using the four general types of equipment, the same lamp size being used for each. A similar diagram (Fig. 2) shows the relative cost of equal illumination of equal areas when using each of the four general types of equipment.

Method of Installation.—The details of installation depend on the local conditions such as the proximity of buildings, intensity desired, etc. The illumination for a large industrial plant grounds may be divided into two general parts—the protective lighting and the yard lighting. Units should be placed around the plant boundaries to give the illumination necessary to enable watchmen to apprehend trespassers. In close proximity to the buildings there should be other units for the purpose of yard work and for prevention of accidents. The state codes of New Jersey, Pennsylvania, Ohio and Wisconsin all specify that industrial roadways and yard thoroughfares shall be lighted.

*Note that the maximum spread of rays is only 20 deg., while with the units shown in Figs. 3, 6 and 7 the spread is 180 deg.

Central-Station March Operations

CENTRAL-STATION INCOME AND OUTPUT GAIN IN PER CENT BY MONTHS FOR NATION

MARCH business of the central stations, according to the returns made to the ELECTRICAL WORLD, shows a better improvement over March, 1917, than the two earlier months of the year showed over January and February, 1917, respectively. The percentages of gain in March, 11.1 per cent in revenue and 9.1 per cent in kilowatt-hour output, are reported by 51 per cent of the industry.

These gains are still below the large rates of increase reported during the very active months of 1917. Whether the industry is creeping slowly back to the greater scale of increase shown in, say, March, 1917, as compared with March, 1916—14.6 per cent in revenue, 23.6 per cent in output—only a prophet could say positively; but the tendency certainly appears to be toward gradual further improvement. Even if the industry holds a gain of around 10 per cent, that, of course, shows that business is reasonably sustained.

At the same time, it should be kept in mind that the statistics are subject to more acute and diverse influences than ever before, and hence that it is more difficult to draw accurate conclusions from them. In March there was the partial closing of industries as one factor, serious coal shortage as another, the further development of hesitation as to which classes of business are essential or “non-essential,” and, what is of

more importance with each month now, increased rates. Following the trend indicated in the earlier months of this year, the rate of increase in revenue was greater than the rate of increase in output.

TABLE I—CENTRAL-STATION RETURNS FOR TWELVE-MONTH PERIOD

Month	Percent- age of Industry Represent- ed	REVENUE FROM THE SALE OF ENERGY			KW.-HR. OUTPUT		
		1917	1916	Per Cent In- crease	1917	1916	Per Cent In- crease

Electric Buses for City Transportation

Description and Tests of New Equipment for Rio de Janeiro—Example of the Employment of the Electric Vehicle for Urban Use—It Is Giving Very Satisfactory and Economical Service To-day, Notably in England

BY GEORGE DRAKE SMITH

Manager Electric Vehicle Department, Edison Storage Battery Company

THE last two or three years have seen a remarkable increase in the use of electric vehicles as passenger buses, and the success of a number of installations has greatly encouraged their use in this particular field. In England, especially, we find the electric passenger bus in quite common use and giving very satisfactory and economical service.

Recently the Rio de Janeiro Tramway, Power & Light Company decided to put trackless buses in service in Rio de Janeiro. Through its consulting engineers and purchasing agents, the Pearson Engineering Corporation, the company investigated carefully the various types of equipment for a trackless bus line and decided upon electric vehicle equipment.

The specifications and tests of these cars are of interest and are given below. They combine the best practice of the car builder, the electric vehicle manufacturer and the storage-battery manufacturer.

SPECIFICATIONS

Chassis—Commercial Truck Company of America.

Capacity—Thirty-two passengers; 9000 lb., including body.

Tires—United States; 36 in. by 4 in. dual front, 36 in. by 4 in. dual rear.

Motors—Four General Electric 1032 E2W5; 60-volt, 32-amp.; 1200 r.p.m.

Drive—Four-wheel concentric gearing; ratio 12.14 to 1.

Bearings—Axle, Timken taper roller; motor, annular-type ball.

Springs—Silico-manganese, oil-treated steel.

Controller—Continuous-torque type, at base of steering column, four points forward, two reverse.

Brakes—Internal expanding, on all four wheels.

Battery Trays—Angle-iron framing for one battery as specified above, consisting of two trays provided with rollers.

Frame—Four-inch rolled-steel channel with angle-iron and gusset-plate tie members.

Axles—Steel forgings; deep I-beam construction, duplicate, interchangeable front and rear; rear-axle motor wheels arranged for anchoring in a fixed position to the axle.

Mileage—The chassis to develop a speed of 14 miles per hour, in accordance with the mileage rating of the Society of Automobile Engineers, with a load of 9000 lb., and to cover 35 miles with this load and 40 miles with a load of 6600 lb. (half passenger load) on 34 kw.-hr.

Battery—Edison storage battery; 72 cells G-14 type.

Rated capacity, ampere-hours.....	350
Capacity (normal charge), ampere-hours.....	399
Capacity (overcharge), ampere-hours.....	460
Discharge rate (five hours), amperes.....	70
Discharge rate (three and one-third hours), amperes.....	105
Average voltage (five-hour rate).....	1.23
Average voltage (three and one-third-hour rate).....	1.20
Normal charge rate (four and three-quarter hours).....	105
Weight complete battery, lb.....	2,660
Calculated consumption for the four-hour operating period (27.12 miles) on a normal charge, on the basis of 30 amp.-hr. per round trip of schedule, amp.-hr.....	360

The first two chassis to be completed were given trial runs to determine their operation. A course in Philadelphia was selected and the conditions of the tests were

conducted so as to approach as nearly as possible true operation of buses in service. The course was over a known distance of 3175 ft. (0.6 mile of city surveyors' maps) of hard asphalt of slight varying grades.

The maximum duty required of a battery on a single charge to maintain the schedule is a total of twelve round trips of 2.26 miles each; mileage, 27.12. The operating period of this part of the schedule is four hours;

running time, twenty minutes per round trip, which includes a total of twenty-four stops. The battery is then withdrawn from service for a time sufficient for a complete recharge. The distance from end of route to charging station is approximately $\frac{1}{2}$ mile.

TEST CONDITIONS

The battery was completely charged at the chassis manufacturer's service station, placed into the battery compartment of the chassis, and with the total load

driven to the test course, a distance of approximately $1\frac{1}{2}$ miles. In this condition the chassis was run over the test course for forty-eight trips, a total mileage of 28.8. On each trip the vehicle made six full stops. Periods of acceleration, coasting and braking were carried out as in actual bus service. At the completion of this run the vehicle was driven to the charging station

From these readings the ampere-hours per mile and the kilowatt-hours per mile are readily calculated. The tests were run over a staked part of the above course of a distance of 756 ft. The vehicle was under full power for the entire distance from a flying start. Table II gives the record.

It is a matter of record that vehicles of this con-

ELECTRIC BUSES OF THE TYPE SHOWN AT THE RIGHT HAVE BEEN PURCHASED FOR STREET TRANSPORTATION AT RIO DE JANEIRO BY THE PEARSON ENGINEERING CORPORATION FOR THE RIO DE JANEIRO TRAMWAY & LIGHT COMPANY. THEY WILL OPERATE UNDER ROADWAY AND TRAFFIC CONDITIONS SHOWN AT THE LEFT

and the battery recharged at 105 amp. for four hours and twenty minutes. At the completion of this charge the loaded chassis was again driven to the test course and another test of forty-eight trips made under the same conditions as the first. At the finish of this second test run the vehicle had been operated for such a period and under conditions so similar to actual service schedule as to enable the performance of chassis and battery to be determined.

struction with the controller arrangement and the four-wheel, four-motor driving and braking will not skid under the most severe conditions of operation. During the above tests this was demonstrated under conditions of heavy rain and where the pavements were covered with fallen leaves. The chassis with the entire test load was fully braked when running at full speed, and the vehicle was driven around corners of 90 deg. street intersection. Furthermore, the chassis was

THE BUSES WERE SHIPPED FROM PHILADELPHIA TO NEW YORK UNDER THEIR OWN POWER. SEVEN TRIPS WERE MADE FROM PHILADELPHIA. BRIDGES AND VIADUCTS WERE MEASURED IN ADVANCE. VESTIBULES ARE SHOWN PACKED FOR FOREIGN SHIPMENT ON THE FIRST CAR, AND THE MAIN BODIES ON THE SECOND CAR, IN CRATES 10 FT. BY 10 FT. BY 20 FT.

Several tests were made of the buses before their acceptance. Table I gives the result of one of these tests.

The vehicle was driven over the known distance, and readings of volts, amperes and time were recorded. Readings were taken for both directions of travel of the above distance, to take care of any variations due to grades, and an average of these readings was taken.

driven through such an angle at full speed, with power off and brakes on, and in no instance was there any tendency to skid.

The writer is indebted to the Pearson Engineering Corporation, 115 Broadway, New York City, for the specifications and figures which are contained in this article.

STATION & OPERATING PRACTICE

METER-TESTING PRACTICE OF SMALLER COMPANIES

How to Get Along Without a Precision Instrument
—Cause of Trouble in Rotating Standards
and the Remedy for It

A Minnesota company which feels that it cannot afford to purchase a precision meter by which to check its standard meter has developed a scheme for determining in a rough manner whether or not the accuracy of the standard is being maintained. Two good customer's type meters are mounted permanently at a carefully chosen location in the company's meter room and adjusted to run at as nearly 100 per cent accuracy, compared with the standard, as possible. The standard is checked against each of these meters at frequent intervals. So long as all three meters indicate no change the company considers it reasonable to assume that no inaccuracy exists in the standard meter. When there is disagreement, however, the standard is sent away to be checked.

The customer's type meters which are used to check the standard are kept running constantly on a very light load created by small lamps. This is done since it is thought that they will retain their accuracy better while running than if they are operated only occasionally. Experience has shown that very often the inaccuracies in the rotating standard meter can be traced to the cord which is attached thereto. Consequently this cord is renewed at frequent intervals.

HOME-MADE CONDUIT BENDER SAVES TIME AND MATERIAL

Bends 20,000 Ft. of Cold Conduit in Many Varieties of Shapes Without Spoiling a Foot of Material

A simple but effective device for bending cold conduit has been developed by E. A. Phipps of the Rockingham County Light & Power Company, Portsmouth, N. H., and has saved considerable time and labor in the reconstruction of this company's power plant. As illustrated here, the outfit consists of a frame upon which a jack can be placed to press against a shoe conforming to the general shape of the conduit. Other shoes are provided at the upper corners of the frame, where they are pivoted so that they will adjust themselves to the curvature of the conduit. The effectiveness of the equipment depends chiefly upon the drawing effect of the shoes.

The outfit will bend any iron-conduit pipe from 1.25 in. to 4 in. (3.2 cm. to 10 cm.) or larger in diameter, using any make of jack on the market. The device is light, portable, easily operated by one man, and can be used in straightening as well as in bending conduit. It will make a 90-deg. bend without flattening the pipe considerably because the recess in the shoe immediately over the jack is relatively deep. Only one piece—the

central block—has to be changed in adapting the bender to different-size pipe. The frame occupies a space of only about 3 ft. (0.9 m.) high by 3 ft. (0.9 m.) long by 18 in. (45 cm.) wide. A bender of this type has been used at Portsmouth, where more than 20,000 ft. (6096 m.) of conduit, requiring every variety of bend, was

CONDUIT BENDER CAN BE OPERATED BY ANY TYPE JACK

necessary, without destroying a single piece of stock. Furthermore, a great saving was effected by not using the usual heating method. It is estimated that the machine easily paid for itself in making the first fifty bends.

EFFICIENT USE OF GAS FOR FUEL IN COAL-FIRED BOILERS

Large Combustion Chamber Needed for Complete Combustion of Gas—Good Construction Allows Boilers to Be Run at 200 per Cent of Rating

The desirability of gas for fuel because of its cleanliness was emphasized by L. A. White, superintendent of the Muskogee Gas & Electric Company, before the annual convention of the Oklahoma Gas, Electric & Street Railway Association. No stoking or cleaning of fires is required, and a number of boilers may be attended and a constant load maintained independent of manual labor.

There are many difficulties, however, in using gas for fuel. Combustion must be completed before the gases come in contact with the comparatively cool boiler tubes because the ignition temperature of the Marsh gas is 1233 deg. Fahr. This can best be accomplished by high boiler settings and large furnaces. The furnaces must also be constructed to prevent the flame from impinging on the tubes, and if this is done, boilers may be utilized for more than 200 per cent of rating without difficulty.

Mr. White said that most of the boilers at Muskogee were originally coal-fired, but when gas burners were installed the grates were covered with firebrick and the

burners placed in the furnace door. The flame was then directed against a checkerwork about 30 in. (76 cm.) from the end of the burner. This arrangement proved to be satisfactory as long as the boilers were not driven hard, but where the demands on the boilers increased the grates were removed, the ash pit lined with firebrick and the majority of the burners placed in ashpit doors. This doubled the size of the combustion chamber and increased the rating of the boilers. Theoretically the reason for driving the flame against the checker wall was to assist combustion by presenting an incandescent surface to the gases, which thus insured ignition and directed the hot gases against the heating surface of the boiler at right angles to it. The effectiveness of a square foot of heating surface obtained by this method should be about eight times that of a similar area arranged parallel to the gas flow. The factor of time is not accounted for in the theory, and the course of the gases is actually diverted and directed against the tubes, where the gas is cooled below the temperature of ignition and combustion arrested.

In operating a group of boilers without steam-flow meters it is possible inadvertently to drive one or more of the boilers beyond safe limits, owing to the condition of the burners either in lagging or leading boilers. The orifice of the burner sometimes becomes obstructed, thereby diminishing the flow of gas in one boiler. If this condition is not general, the load will naturally shift to the other boilers and a high gas pressure will be carried to offset the delinquency. "Scale is not always the cause of tube burning," said Mr. White, "for in 1911 a 500-hp. boiler was installed at Muskogee with twenty-two gas burners. The other boilers were of the same size and type but were equipped with fifteen gas burners. On the first night's run with this boiler operating on the same line with three of the fifteen burner boilers and pulling a 2000-kw. load, twelve tubes in the first row were burned out." A gas fire should burn with a blue flame and white heat, and the presence of a white flame indicates carbon monoxide. The only sure method of judging the efficiency of a furnace is with the Orsat apparatus, but without a collector for obtaining continuous sample or an automatic CO₂ recorder maximum efficiency is likely to be obtained only during the test.

PREVENTING SPONTANEOUS COMBUSTION IN COAL PILE

Laying Screenings Evenly and Subjecting Them to Heavy Rollings Eliminates Possibility of the Fires Likely in Loosely Made Piles

An interesting experiment has been carried out at the University of Illinois in stocking No. 6 Illinois coal mined near Georgetown, Ill. For several years it has been customary for the university to stock 4000 tons to 5000 tons of coal on the ground in piles about 12 ft. (3.7 m.) high, the coal being thrown from railroad cars onto the piles and distributed by scrapers. At times fires occurred in these piles.

During the summer and fall of 1917 a pile of about 10,000 tons of coal was placed on an old tennis court which furnished a hard foundation. This coal was piled to a depth of 10 ft. (3 m.) or 12 ft. (3.7 m.) and surrounded on three sides by a light fence 7 ft. (2.1

m.) high. The coal was transported to the tennis court by means of a motor truck, and the entire surface of the ground was covered to a depth of from 2 ft. to 5 ft. (0.6 m. to 1.5 m.). This layer of coal was then rolled with a heavy roller to pack it down tightly and exclude the air as much as possible. The fence, of course, assisted in excluding the air around the edges of the pile. Plank roads were then laid over the top of the pile so that the motor truck could dump more coal on top of the layer which had been rolled. This process was repeated continuously until the pile was completed. According to H. H. Stoek, professor of mining engineering at the University of Illinois, this method of storing coal proved rather successful. While heating developed in a couple of places where other coal had been mixed with the screenings, the method otherwise proved entirely satisfactory. The cost of storing and reclaiming coal handled in this way averaged about 40 cents per ton.

TRANSFORMERS OF THE SAME BANK ON DIFFERENT POLES

Bank of Units Too Large for One Pole Placed on Adjacent Poles—Cut-outs on One Pole Connected to Other by Buses

Two or possibly three transformers of a bank can be placed on adjacent poles when the location of the transformers on the ground or on a two-pole platform is not feasible. The illustration shows connected in open delta two 2200-lb. (998-kg.), 50-kva. transformers that were too heavy for mounting on one pole. They are installed on a railway right-of-way where a

TWO-POLE PLATFORM ELIMINATED ON RAILWAY RIGHT-OF-WAY

two-pole platform was undesirable. All the cut-outs are on one pole with buses connected to the other transformer, as this is preferable to the installation of a pair of cut-outs on each pole. Line switches are shown in the photo, one placed on each side of the bank. As the bank is in a loop line it may be kept energized while work is done on the line on either side.

TABULATION OF THE COSTS OF USING ELECTRIC TRUCK

Expense of Electrical Energy per Car Mile for
750-Lb. Truck at 3 Cents per Kilowatt-hour
Amounts to 0.8 Cent

Following is a record of a 750-lb. electric truck used
in ordinary city deliveries for thirty working days, pre-
pared from data supplied by the Electric Vehicle Sec-
tion, N. E. L. A.:

Days operated	30
Miles traveled	1,140.5
Kilowatt-hours used	319.5
Number of miles per kilowatt-hour.....	3.57
Greatest energy consumption for one day, kw.-hr.....	13
Smallest energy consumption for one day, kw.-hr.....	10
Average energy consumption for one day, kw.-hr.....	10.65
Shortest run, miles.....	33.5
Longest run, miles.....	46.5
Average run, miles.....	38.01
Greatest merchandise load (overload of 750 lb.), lb.....	1,500
Smallest merchandise load, lb.....	500
Average merchandise load (overload of 250 lb.), lb.....	1,000
Energy cost per car mile at 3 cents per kw.-hr.....	\$0.008
Energy cost per car mile at 4 cents per kw.-hr.....	0.011
Energy cost per car mile at 5 cents per kw.-hr.....	0.014
Maintenance (maximum estimate) including repairs and renewal of all mechanical and electrical parts, including tires, battery and painting of wagon, should not exceed per car mile.....	0.04

APPLIANCES TO OFFSET DAYLIGHT-SAVING LOSS

New Orleans Company Redoubling Sales Efforts
with the Result of Considerable
Additional Profit

"Daylight saving" will result in considerable loss in
revenue unless a vigorous campaign for broadening the
use of electric labor-saving appliances in the home is
pushed through, according to W. E. Clement, contract
agent for the New Orleans (La.) Railway & Light Com-
pany.

Realizing the need for overcoming the loss in light-
ing revenue, the commercial department of the New
Orleans company is redoubling its efforts toward the
sale of appliances. This campaign, instead of proving
an expense from a promotion standpoint, is actually
turning out to be a big money maker.

Vacuum-cleaner sales, on which there is a large profit,
show an increase over last year, Mr. Clement states, of
several hundred per cent; sewing-machine motors, 50
per cent; vibrators, 40 per cent, and miscellaneous appli-
ances, 182 per cent.

Foreseeing the necessity for boosting the sale of ap-
pliances, the manufacturers were called upon to supply
about 30,000 pieces of advertising matter showing sum-
mer electric goods, all of which are now being distrib-
uted by means of boxes placed in street cars. In addi-
tion, the company is using bill stickers, car cards and

a small amount of newspaper space. Fans especially
are being featured at present, it being foreseen that on
account of the extra hour in which business men will
be at home during the heat of the afternoon a great
demand for fans will result.

Extra tables are being placed in the salesroom carry-
ing miscellaneous electric appliances, with such season-
able articles as wicker lamps in great abundance, a
large sale being anticipated on this class of goods.

On the floor a special sewing-machine demonstration
has been arranged, and visitors to the office cannot fail
to be attracted by the sight of a young woman rapidly
running off summer goods on a machine in full sight of
passers-by.

TAXES WHICH AFFECT THE PUBLIC UTILITIES

Injustice of Subjecting Properties to Large Addi-
tional Burden of Expense Which They Cannot
Pass on to the Consumer

At the present time, when utilities are finding it so
hard, in spite of large gross earnings, to make both ends
meet, additional expenditures make it all the harder to
show any profit. Among such expenditures which have
been greatly enhanced by the war are taxes. There have
been some new taxes and some taxes have been in-
creased. In addition, the expense attached to mak-
ing out a tax report sheet is a very considerable
item. The injustice of the increase of taxes to
which utilities must submit without recourse to higher
rates was outlined by H. Spoehrer, secretary and treas-
urer of the Union Electric Light & Power Company, St.
Louis, Mo., before the Missouri Association of Public
Utilities at the recent convention. Mr. Spoehrer said in
part:

Supplementing the normal taxes we have had enacted re-
cently by each of the divisions of the government addi-
tional taxes to meet extraordinary needs, the accumulation
of which is becoming rather burdensome, especially since the
utility has not been offered the means with which to meet
these demands. There would, of course, be no cause for
complaint as to such taxes as are levied against all indus-
tries indiscriminately, provided that the sale price of the
utility's commodity were advanced and any additional tax
thus borne by the consumers as is the case in other indus-
tries, instead of reducing the earnings of the stockholders,
which with the utility company are already limited.

One of the cardinal principles of a public utility is the
avoidance of the practice of discrimination, yet legislative
bodies have no hesitancy in levying discriminating taxes
against utility corporations, notwithstanding the fact that
earnings of these companies are already regulated and lim-
ited.

Special taxes should, therefore, be eliminated. Under
this class I include such items as franchise taxes and gross
income taxes, which are not exacted of other industries.

The array of general taxes, federal, state and municipal,
now in effect presents the following:

First—The general property tax under which all tangible

property owned by the taxpayer, real and personal, is taxed at the rate of \$2.35 per \$100.

Second—Merchants' and manufacturers' license tax of \$1 per \$1,000 of sales or gross receipts.

Third—The federal income tax. This tax, originally 1 per cent of the net income of the corporation, was later increased to 2 per cent. In October, 1917, it was again increased, now amounting to 6 per cent of the net income of the corporation. Under this title also we may mention the 2 per cent normal personal income tax which the corporation pays on behalf of the holders of any of its bonds which contain a tax-free covenant.

Fourth—Ten per cent federal tax on undistributed income. This is a new tax, effective Jan. 1, 1917, and applies on the amount of earnings remaining undistributed six months after the end of each calendar or fiscal year.

Fifth—Federal capital stock tax levied at the rate of 50 cents per \$1,000, or one-twentieth of 1 per cent on the fair value of the capital stock of the corporation in excess of \$99,000. This tax will cost our company \$6,200 in 1918.

Sixth—Federal war excess profits tax. This tax varies, depending on the amount of earnings and the invested capital of the corporation. Since it is impossible for a public utility to derive excess profits from its business, this tax concerns us chiefly by the annoyance and time consumed in making the formal returns.

Seventh—Federal freight tax, a tax of 3 per cent on the amount paid on freight bills. This is a new tax, which we estimate will affect our company this year to the amount of \$6,150.

Eighth—Express tax of 5 per cent on amounts paid for express charges will amount to \$230 for our company in 1918.

Ninth—Federal tax on telegrams and telephone calls, at the rate of 5 cents per message on all messages costing over 15 cents, will amount to a tax of \$220 on the business of our company this year.

Tenth—May be mentioned, not perhaps distinctly as a tax, but as increased cost of mail service; the increase in postal rates is 100 per cent on post cards and 50 per cent on all except local letters.

Eleventh—Documentary stamp taxes, including those on issues of capital stock, will cost our company more than \$10,000 during the year.

Twelfth—State franchise tax of 75 cents per \$1,000 of the outstanding capital stock and surplus of the corporation employed in this State. This will affect our company to the extent of \$17,500.

Thirteenth—State income tax, amounting to one-half of 1 per cent of the net income. This peculiar law is now under test by an action brought by the St. Louis Chamber of Commerce questioning its validity.

Fourteenth—State-secured debts tax, a new stamp tax imposed by laws of 1917 on obligations at the rate of 5 cents per \$100 per year to the maximum of 25 cents per \$100, will affect us to a slight degree in the issuance of securities.

Fifteenth—State motor-vehicle license tax, which by the 1917 session of the State Legislature was increased 100 per cent. The increased burden on our company by this tax amounted to more than \$600 this year.

Sixteenth—Fees on security approvals. Though not an ever-present item of taxation, a complete list should include the fee of \$1 per \$1,000 which these utilities must pay to the Public Service Commission upon the approval of issues of stocks or bonds. We are not objecting to this tax, since it is applied to the maintenance of the commission, and it is probably fair that we help support the boss; but it may be pointed out that no other lines of business are taxed in a similar manner to support a regulatory body having at its principal purpose the limiting of the earnings of such business.

Seventeenth—Annual registration fees. Though practically negligible in amount and concerning us chiefly on account of the time and expense consumed in compiling the report, the annual corporation registration fee of \$5 constitutes another tax to which we are subject.

Eighteenth—City and county secured debts tax, levied by the counties and by the city of St. Louis, both as a county and a city, thus making this tax in St. Louis amount to twice the state tax under the same law.

Nineteenth—City motor-vehicle license tax, in amount equal to one-half the state tax. The total state and municipal motor vehicle license taxes added to the chauffeurs' license taxes paid by our company will this year be approximately \$2,400.

These, together with the franchise tax of \$117,500 and the 5 per cent gross income tax of \$190,000, make a remarkable total of twenty-one different taxes paid by our company in St. Louis. The enormity of this burden is more clearly perceived when it is stated that the aggregate total of all this taxation exceeds \$539,000 per year, amounts to 12.8 per cent of the gross receipts from the distribution of electricity in the city of St. Louis, and exceeds the total net income of our company for the year by more than 30 per cent. Thus it is seen that the federal, state and municipal governments, without having a cent invested in the enterprise, receive a greater amount out of the earnings of the company than is received by the stockholders who have furnished the entire investment. It must be remembered also that this is taxation to which we are subject while earning an income of a very small percentage on the total investment, a percentage which has been reduced to an "irreducible minimum," and without the application of excess profits taxes, since the realm of such profits is wholly strange to public utilities.

Neither does the amount paid in these taxes represent their actual cost to the utilities. The cost in time and labor consumed in preparing the data for the returns and the making of the returns themselves, together with other returns occasioned by these and other taxes, such as information returns under the personal income tax laws, has increased until the amount so consumed represents a heavy expense.

A list of the returns and reports occasioned by these various tax laws includes the following:

(a) To the federal government: (1) Income tax returns; (2) capital-stock tax return; (3) war excess-profits tax return; (4) monthly income tax return of personal tax withheld at the source; (5) annual return of information under income tax law on payments of \$800 or more to all employees and a large class of recipients.

(b) To the state government: (6) Income tax return; (7) franchise tax return; (8) annual corporation registration.

(c) To the local or municipal government: (9) Personal property tax return; (10) 5 per cent gross receipts return, made twice yearly; (11) merchants' or manufacturers' license tax return.

It is clear that all these returns and reports require a vast amount of statistical work.

In this review of our tax problems and burdens we do not mean to criticize all the forms of taxes or object by wholesale. Some of these taxes are both necessary and correct in principle and are, therefore, above reproach. What we wish to emphasize are the staggering proportions to which taxation grows by its cumulative effect, and especially to point out that with the load of necessary general taxation it is high time that special taxation discriminating against public utilities should be objected to and abolished. As before stated, the worst of these are franchise taxes, and in St. Louis, the 5 per cent gross receipts tax. The particular vice of this tax is that it imposes on the utility, and through it upon its patrons or consumers, a tax to obtain revenue which is used for general purposes and to the benefit of the whole public, including those who are not users of the service and, therefore, bear no share whatever of the tax.

These special forms of taxation should be eliminated, and in view of the present period of exceptionally heavy general taxation, due recognition should be taken by the commission of the needs of the utilities to enable them to meet the situation by a proper increase in rates charged for utilities' service.

Every public utility in the State is subject to this great load of taxation, with the possible exception of franchise and gross receipts taxes, depending on local conditions. The suggestion of rate adjustments is pertinent, therefore, especially in view of the important function of the utilities in this time of national need. Adequate earnings are obviously necessary to enable the utilities to operate with efficiency.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Characteristics of the Induction-Type Generator.—The inductor-type generator has come to be universally recognized as the standard type of generator for the 500-cycle, single-phase power supply of the modern wireless-telegraph stations. The principles of operation and methods of testing and predetermining the operating characteristics are discussed.—*Electrical Review*, April 27, 1918.

Improvement of the Turbo-Alternator.—An editorial comment on S. F. Barclay's paper, presented before the Institution of Electrical Engineers, which gives the relative advantages of solid and built-up rotors for machines of large output. In large machines the solid rotor construction has inherent defects which have not yet been eliminated. The larger the diameter or the greater the volume of the rotor, the more likely are the defects to become pronounced. Ductility varies considerably through the mass, and the heat treatment does not penetrate to the center of a large forging, nor is it uniform in the case of a hollow forging having walls of considerable thickness. A large forging can neither be tested nor inspected with the same degree of thoroughness as by the test and inspection methods in every-day use in the machine shops. Forgings are very difficult to obtain in large sizes as there are very few who could undertake the work. On the other hand, the built-up rotor has none of these objections as the plates are thin and no part is more than an inch from the surface. The construction difficulties of the built-up rotor are much greater. Outputs of turbo-alternators become restricted owing to insufficient cooling surface or ineffective cooling surface, and since the area of the cooling surface cannot be greatly increased, a means of improving its efficiency will have to be found before there can be any radical increase in the specific output. Improvements in the design and construction of the end bells—or, preferably, improved design and arrangement of the rotor winding of such a kind as to eliminate the end bells—would simplify the design. Without epoch-making discoveries the designer will have to be content with copper and its troublesome losses and defective mechanical properties. The magnetic properties, however, as well as the reduction of the specific loss in commercial iron, can be greatly improved.—*London Electrician*, April 5, 1918.

Lamps and Lighting

Lumens Versus Candles.—H. ARMAGNAT.—The candle-power unit in general use in the commercial classification of incandescent lamps does not respond to modern needs, and its meaning has been so changed in current phraseology that it has become necessary to substitute for it the unit of flux, which defines better the quantity sought. The author thinks that this substitution has met with stronger resistance in France than in other countries and makes a mathematical and

diagrammatic argument in support of the contention that the lumen should be adopted for the classification of lamps and the candle restricted to its precise sense as a unit of intensity.—*Revue Générale de l'Electricité*, April 27, 1918.

Glasses for Protecting the Eyes from Injurious Radiations.—W. W. COBLENTZ and W. B. EMERSON.—General characteristics of certain newly developed glasses used for protecting the eyes from injurious forms of radiant energy, especially the infra-red or so-called heat rays, are given. Because of the difficulty in reproducing the same color in different melts, no attempt is made to give specific data on the transmission for a given thickness of glass. These glasses under consideration are known as euphos, fieuzal, akopos and novi-weld. An appendix indicates which part of the radiation from a gas-filled tungsten lamp, a magnetite arc and a quartz mercury-vapor lamp is transmitted through various substances, thus showing in a condensed table the protective properties afforded by these glasses.—*Technologic Papers of the Bureau of Standards*, April 4, 1918.

Generation, Transmission and Distribution

Radiant Heat and Fire-Box Design.—JAMES T. ANTHONY.—The amount of heat absorbed by boiler surfaces due to radiation depends upon two things—first, on the area of the radiating surfaces; second, upon the temperature. If the firebox heating surface is increased without increasing the area of the heat-radiating surfaces or their temperature, there will be practically no increase in the amount of heat radiated. With coke or a hard coal that burns without any flame, the total amount of radiating surface would be equal to the grate area, so that increasing the firebox heating surface would have only little effect on the firebox evaporation. When using a highly volatile coal, however, the heat radiated from the fuel bed can be disregarded, for in this case the temperature and extent of the flames become the controlling factor. The flames, being interposed between the heating surfaces and the fuel bed, absorb the heat radiated from the fuel bed in addition to the heat being generated within the flames by the burning combustibles and radiate this heat to the surrounding heating surfaces. It is then apparent that increasing the capacity of the firebox and filling the added volume with flame results in increasing the radiating surface and the amount of heat radiated. The amount of flame in a firebox depends primarily upon the amount of combustible gas being driven off, the air supply and the volume of the firebox. With a fair grade of bituminous coal and ordinary firing methods, fully 50 per cent of the heat generated in the firebox is due to the burning of combustible gases above the fuel bed. In order to burn these gases completely it is necessary to have an excess of oxygen above the fuel bed, to mix the oxygen intimately with

the combustible gases, and to provide sufficient flame-way or combustion chamber space. If the mixture is not thorough and the quantity of oxygen is not sufficient, the gases will burn more slowly, the flames will be longer, and combustion is apt to be incomplete.—Extracted from paper read before the Central Railway Club, May 10, 1918.

Current-Limiting Reactances.—The desirable features that reactors should possess and the details of construction to fulfill these requirements are discussed.—*London Engineer*, April 12, 1918.

Installations, Systems and Appliances

Low Temperature Industrial Heating.—DWIGHT D. MILLER.—The operation, control and advantages of this type of heating are considered in the conclusion of the paper. A short discussion is presented of how the heating load is acquired and the advantages of electric cooking. The author states that the most important advantages obtained by the use of the heat of electric energy are that it can be generated in any quantity regardless of temperature and that it may be absolutely and exactly controlled. Many commercial processes can be carried on with the same accuracy and duplication of results as can be obtained in the laboratory, and many uncontrollable variables are eliminated. With the ordinary combustion-heating process a slight change in the humidity of the air or velocity of the wind will have a pronounced effect on the results obtained, whereas if electric heating is employed no effect is noted.—*Ohio Electric Light Association Monthly*, April, 1918.

Design and Operation of a Small Kjellin Furnace.—GEORGE H. STANLEY and W. BUCHANAN.—The authors point out that an induction furnace is somewhat similar to a single-phase, core-type alternating-current transformer subject to the limitation of non-sandwiched windings and a horizontal position of the secondary. Data on the cost of operating such a furnace are given as follows:

Scrap, 70 tons at £1.....	£70	\$339.50
Pig iron, 1½ tons at £20.....	30	145.50
Aluminum, 30 lb. at 2 shillings.....	3	14.55
Magnesite (calcined), 2 tons at £18.....	36	174.60
Miscellaneous stores	15	72.75
Repairs and renewals.....	15	72.75
Tools, etc.	5	24.25
Electric power	200	970.00
Cartage	30	145.50
Miscellaneous sundries	20	97.00
Salaries, wages and supervision fees.....	400	1,940.00
	£824	\$3,996.40
Per ton, nearly.....	14	66.50

—*Journal of South African Institution of Electrical Engineers*, September, 1917.

Experiments in the Electrothermic Production of High Temperatures.—JEAN ESCARD.—The author describes the mode of employment and the principal object of the chief laboratory ovens employed in practice, including ovens with resistant metallic plates or wires surrounding refractory tubes, arc ovens, arc ovens with resistance, and resistance ovens simply.—*Revue Générale de l'Electricité*, April 13, 1918.

Steel Fusion Welds.—When steel is welded by the aid of the oxy-acetylene blowpipe or the electric arc, the heating is very local and the grains become coarser. This is particularly noticeable with arc-welding, in which heating and cooling are more rapid. On the grain boundaries cementite appears, sometimes pearl-

ite. A microphotographical study of the welds brings out other interesting peculiarities, said S. W. Miller, proprietor of the Rochester (N. Y.) Welding Works, before the American Institute of Mining Engineers. The paper he presented was illustrated by a large number of photographs. In addition to the cementite spots, there are generally fine specks of oxide. Welding also seems to introduce gases—nitrogen and probably hydrogen—into the steel unless the welding rod—generally a low-carbon wire of 0.1 per cent or 0.18 per cent of carbon—contain manganese or vanadium. These constituents have the disadvantage, however, that they cause a slag to form which does not easily float to the surface. The burning and agitation of the steel also leads to a change in the carbon content. Electric welds further show peculiar fine lines or cracks which seem to be the sides of diagonals of squares. Miller has found, the author said, that they darken when boiled in sodium picrate, are more numerous with high-carbon wire than with low-carbon wire, and disappear after heating the specimen above 750 deg. C. and then cooling at certain rates. On the other hand, the lines widen in steps on prolonged etching, which would be compatible with their being lines of incipient fracture along planes of cleavage.

Electrophysics and Magnetism

Radiation from Systems of Electrons.—SIR J. J. THOMSON.—The author deals particularly with the phenomena which are generally discussed under the heading of "Roentgen Rays and Crystal Structures," though he does not use that expression. He says that the center of the disturbance is generally supposed to be the atom, whereas one really has to deal with two sets of gratings, that due to the arrangement of the atoms in parallel planes and that due to the grouping of the electrons of the atom. Each set of gratings has its own system of spots.—*London Electrician*, April 5, 1918.

Precharged Condensers in Series and in Parallel.—V. KARAPETOFF.—By "precharged" the author means that a condenser is charged from a source of direct voltage and then is used as a booster in series with this source to charge another condenser. By repeating this process a large number of times the second condenser is finally subjected to twice the voltage of the source. This is considered in series, parallel and network of condensers.—*Proceedings A. I. E. E.*, May, 1918.

Miscellaneous

Central Heating as a Means of Conserving Fuel.—F. G. CLARK.—The ideal system would utilize low-pressure steam from a steam electric power plant, which could be taken from the low-pressure stage of steam turbines through suitable regulating valves and be superheated by a suitable heat exchanger before passing into the street mains. The conditions which best suit this method of supplying heat are a closely built-up section of a city and a central location for the supply plant, which usually provides for a fan-like distribution system. As an economic proposition the central heating plant can offer to customers in a limited district a supply of heat for approximately what their coal would cost them, leaving a fair return on the central heating system investment.—*Toronto Electrical News*, May 1, 1918.

TWELVE GOLF BALLS BRING IN THIRTY-FOUR HUNDRED DOLLARS

This Sum Realized for the Red Cross by Successive
Auctions of These Articles at Last Week's
Hot Springs (Va.) Convention

BY O. FRED. ROST

Member Electrical Supply Jobbers' Association

Boom! Boom! Boom!

While a number of murdering, brutalized sky pilots sent out by the "Beast of Berlin" were bombing hospitals back of the Allies' lines, were killing some of their own wounded along with those of the enemy and murdering nurses and Sisters of Mercy, a gathering of business men representing all sections of the United States quite unexpectedly made a demonstration which, when it finally ended, proved to have raised a substantial fund for repairing some of the damage caused by those murderers.

The members of the Electrical Supply Jobbers' Association had once more invaded the peaceful valley in the Virginia mountains where at Hot Springs the Homestead Hotel spreads itself along the mountain.

Although not many months previously it had donated a fully equipped ambulance to the American Red Cross, the association again voted a donation of several thousand dollars to this body. Just before adjournment a messenger brought to Franklin Overbagh a box containing twelve golf balls donated by the manufacturer as a prize in the golf tournament. No tournament having been scheduled on account of matters pertaining to the war requiring the greater part of the time, the golf balls were to be auctioned off for the benefit of the Red Cross.

Here was an opportunity to make good, and the suggestion that the golf balls be auctioned off separately, instead of as a lot of twelve, was readily carried out. Whoever made the suggestion surely did not know what was being started, for those balls, being round, kept right on rolling. From offers of \$25 for one golf ball the bids soared higher and higher until over \$100 was bid. Frank Price of Boston purchased the privilege of auctioning off the last ball and brought a record figure.

The twelve original purchasers of those most precious golf balls got together and as a body presented the twelve balls to Mr. Overbagh, and here Mr. Overbagh entered into his rôle as angel of the Red Cross, because hardly had the presentation been completed when up he jumped and asked, "Gentlemen, how much am I bid for these golf balls?" Friend Herstein lost no time in calling for eleven other members to form a syndicate of twelve to buy the balls at \$10 each. Three times the number responded to the call, and the balls went to the Herstein syndicate for \$120. Again they were presented to Mr. Overbagh, who immediately for the second time placed them on sale. Mr. Sackett duplicated Mr. Herstein's feat, and the Sackett syndicate bought in the balls. However, these wonderful balls

were not going to stop there, and with an ability for keeping on rolling never before displayed by any other balls on the links or off them they kept moving.

A meeting called right on the floor carried a resolution to offer \$150 for those golf balls in the name of the Dixie Club. Monopolies not being allowed under the Sherman law, the Erie Club rose to the occasion by also calling a meeting and raised the bid to \$175. Friend Bernardin, sole representative of the Missouri River Club, shouldered the responsibility of raising the bid to \$200 in the name of his club.

About this time the Dixie Club, having already splendidly supported its president in the Herstein syndicate, decided on a retirement for strategic reasons. President Bissell of the Lake Erie Club then took full possession of the balls through his club's bid of \$250.

As a reward for offering a motion which added several hundred dollars more to the already large fund, Mr. Garron was finally presented with the twelve golf balls, but though apparently stowed securely all in that little box, those balls really kept right on rolling.

The question came up as to who should make the presentation to the young lady of Red Cross fame, and in the bidding that followed Brother Bernardin of Kansas City secured the privilege with the highest bid.

The following morning \$1,510 was reported to have been collected. The news of the excellent collection had traveled quickly, and the proposed presentation of the money immediately took its place on the program for the day as being the most important event.

All the ladies wanted to be present and the manufacturers, though feeling rather slighted at not having been given a chance at the golf balls the night before, also condescended to be present. However, the fat bank rolls of some of the manufacturers had not been forgotten, and when the young lady was ready for the presentation, she also was ready with the golf balls, which had been once more donated for the Red Cross.

The first ball went at \$50, and with final bids constantly going higher, the last ball was knocked down to its fortunate purchaser for the small sum of \$202. In the brief auction the manufacturers had, through buying up the golf balls, raised \$1,527 for the Red Cross. However, the jobbers present were not going to be outdone by any means, and within a few minutes after the total derived from the manufacturers' auction had been announced the jobbers had got together and raised \$300 and some odd dollars more, making their total to the Red Cross fund upward of \$1,800. Total funds secured by the means of those twelve golf balls were nearly \$3,400, and if it had not been that other than golf balls are needed "over there" and electrical manufacturers and jobbers have an important mission in getting enough balls to the other side to bury the Kaiser, those golf balls would still be rolling and gathering in dollars for the greatest mother of us all—the American Red Cross.

GEORGE H. GUY'S SERVICE RECOGNIZED BY SOCIETY

New York Electrical Society Passes Resolutions in Recognition of the Thirty Years' Devoted Service of Mr. Guy

At the meeting of the New York Electrical Society on May 23 resolutions were passed as a recognition of the faithful and devoted service given by George H. Guy during his thirty years as secretary.

Engrossed resolutions passed by the nominating committee were presented by Edwin R. Katté, vice-president, to Mr. Guy. In these the committee sincerely and gratefully extended to Mr. Guy "our affectionate greetings and congratulations upon his long and faithful service, and our best wishes for the continuation of that service, and for his good health, his happiness and his prosperity."

A resolution proposed by T. C. Martin and seconded by Dr. C. O. Mailloux, senior past-presidents of the society, indorsing the sentiments expressed by the nominating committee, was passed.

The ticket for the coming year, nominated by the nominating committee, was announced as follows:

For president, A. L. Doremus.

For vice-presidents, Dr. E. G. Acheson, C. A. Benton, Philip Torchio.

For secretary, George H. Guy.

For treasurer, Thomas F. Honahan.

The following data are of interest as bearing on the fact that this is the banner year of the New York Electrical Society:

1. It has had during the year its largest membership increase, 519, bringing the aggregate membership up to 991.

2. The average attendance at its lectures has been 417, the highest but one of the twenty-two organizations in the Engineering Societies Building, and relatively to the membership the highest, and actually the highest of all electrical societies in the country. The whole of the eight meetings of the season have been devoted to war subjects.

3. The society has the largest bank balance it has ever had.

CONTROVERSY COVERING POWER DISTRIBUTION IN LOS ANGELES

Los Angeles Gas & Electric Corporation Seeks Injunction Against City to Prevent Construction of Paralleling Existing Lines

The Los Angeles Gas & Electric Corporation has filed injunction proceedings against the city of Los Angeles seeking to prevent the municipality from paralleling the company's power lines. The complaint states that the plaintiff is adequately serving the districts affected and that the city has entered competition to sell, "at a profit and for a price no less, electricity no better."

This is contrary to the existing laws, the application states, since no permit for competitive service has been secured from the State Railroad Commission. The court is asked to enjoin the city from further work on the paralleling system.

Birthday Tribute to Henry L. Doherty

The president of the Cities Service Company, a guest at a banquet in honor of his forty-eighth birthday, Grand Central Palace, New York, on May 15, made two announcements to the 300 present. One was that Mr. Doherty and his partner, Frank W. Frueauff, had decided to create a securities fund, the income from which will be applied to

scholarships for the sons of Doherty employees receiving salaries of \$200 a month or less. The intention, broadly, is to put these junior Doherty men through college, and then by placing them in the various Doherty training schools prepare them to carry on the organization work. The other was the launching of a proposed Doherty fraternity.

THE ASSEMBLED DELEGATES TO THE DEL MONTE (CAL.) CONVENTION OF

Public Policy on the Pacific Coast

Prompt and Efficient Action Necessary to Protect Utilities—Interconnection of Systems, Water-Power Legislation, Rates, Man-Power Reduction and Financial Help Are Immediate Problems

This gives some of the main points in the report of the public policy committee of the Pacific Coast Section of the National Electric Light Association. The report was presented by John A. Britton, chairman of the committee, at the meeting at Del Monte, Cal. on May 9 to 11. It is of timely and vital interest as a presentation of war problems.

TRUE to the traditions of old, the public utilities have, by their co-operative efforts with the government and its recognized agencies in all of the demands made upon them, given to the loyal people of the United States a different perspective in contemplating utilities as such, and it is strongly recommended by your committee that a bureau be established, to act in conjunction with national bodies organized for that purpose, looking to the distribution of a propaganda calling for a fair consideration of the rights of utilities, and that the old and time-worn spirit of antagonism be forever buried and forgotten, that the public may be brought to the realization that in these times of our troubles, common to all, the public utilities stand for all that the people stand for, and that under regulation the people are protected from profiteering by the utilities to a greater extent than the people are protected by the government regulation of all of the commercial industries and businesses; and we again pledge ourselves to that offer made at our last convention to the President of the United States.

Through the joint efforts of the Railroad Commission and the Fuel Administration there has been brought about in the State of California an interconnection of companies that it is safe to say could not have been accomplished otherwise than as a patriotic measure. It has thus afforded an appreciation of the economic advantages of centralization and unification and a great and potent saving of capital and of energy. The results of the bringing together of the companies

are to be found in the records of the Railroad Commission and display in a very forceful manner the sacrifices that were made of individuality to accomplish the greater good to the nation.

The Congress of the United States has now under consideration a bill for the leasing of public lands for power development. This bill, if enacted, will materially help to unlock the doors that for years have been locked and have kept away the maximum possible development.

Appeals to regulatory bodies were commenced during the year 1917 by companies which as long as it was possible forbore to apply for relief, anxious that their motives might not be misconstrued, and until it appeared that the capital invested in service to the public was facing absolute ruin if rates were not increased appeals for relief were not made. In most cases the increases granted on preliminary applications were largely temporary, as the rapid continued advances in price of labor and material could not be met by any action of rate-fixing authorities.

On the Pacific Coast the increased cost of oil has been the most potent factor in increasing the cost of service to public utilities. From October, 1916, to date, the base field price has risen from 35 cents per barrel to \$1.23 per barrel, and this has been all the more severe upon the electrical operating companies by reason of the greater demand made upon them for service and the lessened hydroelectric output.

Few stop to think that if the service of the public utilities throughout the country should stop the whole war program would instantly collapse. It follows that in so far as the efficiency of a public utility is impaired the war program is proportionately delayed and interfered with.

Congressional help, an attempt to give which is made in the recent act of Congress, while affording some relief in refunding obligations, does not, because of the

PACIFIC COAST SECTION OF THE NATIONAL ELECTRIC LIGHT ASSOCIATION

short term of loans by the government and the added fact that loans must be made only for enterprises directly connected with governmental war activities, afford relief for permanent extensions to plants which cannot come into full earning power for years and which cannot be directly allocated to war-time activities.

The utilities must themselves take care of the future, and in no more certain way can this be accomplished than by being permitted to earn such return upon capital as will encourage the investor. At best the ability of the utilities to enlarge their facilities will during the progress of the war be reduced to a minimum unless this aid shall be forthcoming, and it is certain that without some constructive help from the state commissions there will be a curtailment of demands deemed to be purely essential in the furtherance of our nation's work.

We must find ways, and means to meet these demands and prepare ourselves for the day that is to come when with the embargoes now existing removed there will be a forward movement toward the realization of the dream of a State busbar—yes, even a national one—as the most economical to serve the needs of the people.

Withdrawal of man power has proved to be the most serious handicap to the fullest economical administration and development of utilities, not only in the loss of such trained men but in the necessity for the substitution for them of men untrained and unfitted by contact and environment to take up the burden of those who have enlisted in the ranks.

This labor situation is one which we must face with the greatest concern, not only in the immediate present because of the withdrawal of the effective man power, but in the future, with the probability of never again approaching the degree of efficiency that heretofore has characterized organizations like ours.

Your committee fully believes that if the general public, always fair in its final conclusion, can be made to feel the true force and effect of the participation of utilities in the service of the government and their unquestioned patriotism, then when questions arise between the utility and public greater consideration will be shown than has heretofore been the case.

Aside from the giving of service by the depreciation

of man power, the utilities have been called upon constantly to render aid and assistance to the various branches of the federal government. At no time has there been found lacking the necessary sacrifice of time and labor to make all of these governmental agencies effective, and the men of the public utilities have deemed it an honor to be classed as dollar-a-year men.

Perhaps one of the blessings in disguise due to the war has been the necessity brought home to the public utilities for economizing in all of their departments by the elimination of unnecessary operation and by reducing so far as they can, through automatic devices and otherwise, the necessity for man power.

The efforts made by the manufacturer, jobber and dealer at the last annual convention to secure recognition by the companies have been productive of results, and the trial now being given will demonstrate the effect of such co-operative work.

RESOLUTION ON WATER POWER

The following is the resolution reported by the public policy committee of the association on the water-power situation and adopted by the convention:

Whereas the future welfare of the public-land states depends upon water-power development to increase the location therein of industries to which cheap and constant power is a necessity and further to develop their agricultural possibilities; and

Whereas true conservation consists in saving that which is destructible, such as our forests and oil and coal deposits, and using that which is indestructible, our falling water, and

Whereas the immediate development of a potential power by water of not less than 100,000 hp. per year would bring arid lands into bearing, provoke the development of industries utilizing the hidden wealth of the public land states, and build up an empire in the West, and

Whereas the existing laws have prohibited the full development of the water-power of these States;

Now, therefore, be it resolved, that the Pacific Coast Section of the National Electric Light Association in convention assembled urges upon the Congress of the United States to enact at once such remedial legislation as will encourage development of the millions of horsepower now wasting to the seas, that true and not false conservation may prevail, and that the waste of fuels in generation of electric energy may be minimized:

Resolved further, that a copy of this resolution be forwarded by the president of this association to the President of the United States, to the Secretaries of War, the Navy and the Interior, and to Representative T. W. Sims.

POSITION OF DIRECTORS OF WAR FINANCE CORPORATION

Applications Are Made by Public Service Companies
for Loans Amounting in the Aggregate to
a Large Sum

Directors of the War Finance Corporation have authorized the statement that they have under consideration applications from many public service corporations doing business in various sections of the country for loans aggregating a large amount.

The directors of the War Finance Corporation do not feel that they have any authority under the law to make loans except upon adequate security, as required by the act, and they are convinced that the inability of a utility company to earn a sum at least sufficient to pay its fixed charges, taxes, maintenance and repairs is conclusive evidence of the inadequacy of its own obligation as security.

The directors of the corporation feel that the localities served by these various public-utility enterprises should not expect the War Finance Corporation to make advances to any utility company whose statement shows that it is in actual need of increased revenue. It is a matter for the local authorities to determine whether or not an increase in rates sufficient to maintain the enterprise as a going concern should be granted.

It is urged, therefore, that the proper authorities give prompt consideration to applications made by public utilities for permission to increase rates in order that the directors of the War Finance Corporation may know when applications for loans are presented by public utility corporations whether or not they will be able to give adequate security.

A supplemental statement indicated that the reference to increased rates was not intended to stop all negotiations for financing by such corporations. It is understood that the Capital Issues Committee and the War Finance Corporation will entertain propositions from public utilities companies and treat each application on its individual merits.

On May 28 the directors announced:

From the applications received by the War Finance Corporation there seems to be an impression in certain quarters that the corporation was specially designed to provide funds for meeting maturing obligations, particularly those of public utility companies. The law expressly provides that the corporation shall not make direct advances to provide funds to meet such maturing obligations, except possibly in some rare case which could clearly be brought within the "exceptional cases clause." Of course, the corporation will stand ready to lend its assistance to banks and bankers in proper cases where they have themselves made advances to war industries, whether for the purpose of meeting maturing obligations or otherwise, and direct advances in deserving cases that come clearly within the provisions of the law.

Holders of maturing obligations, whether of public utilities or of other concerns which may find themselves unable, because of temporary conditions, to meet their commitments punctually should consider whether, in the public interest, as well as their own, they should not co-operate by consenting to reasonable renewals. Public utility companies particularly, in co-operation with the communities in which they operate, should adapt themselves to the changed conditions brought about by the war.

No machinery has been specially provided for direct purchases of obligations of the public utilities, whether to meet maturities or otherwise, either through the War Finance Corporation or through any other governmental agency.

The situation of these public utility companies is, therefore, quite different from that of the railroads, where Congress has made specific provision for the purchase of their securities by the government in certain exigencies, yet even the railroads are expected, wherever possible, to meet their own maturities and to pay what the money is worth to accomplish that end.

It must be remembered that the railroads are under federal operation, and that their rates are subject to federal control, and that the government therefore is in a position to see to it that their charges shall be sufficient to meet the cost of the service rendered. In the case of the public utilities, however, neither their operation nor their rates are subject to federal control. Wherever the charges do not amount to adequate compensation for the services rendered, relief can be had only through the appropriate local authorities, and time is essential to enable the companies and the communities in which they operate to reach a satisfactory solution of this important problem. It is not a problem which can be disposed of by having the federal government through the War Finance Corporation assume the burden of financing the operations of these local companies, except in exceptional circumstances which may make it a matter of national importance that advances should be made.

The local authorities will no doubt respond as promptly as possible in cases where relief is needed because of changed conditions, as it is clear that the soundness and efficiency of public utilities are intimately connected with a vigorous and successful prosecution of the war.

Directors of the War Finance Corporation on May 22 approved the first loan to be made under the authority conferred upon them by the act approved April 5, 1918. The loan, which was authorized after a hearing of representatives of those interested, is for \$1,000,000, and will run for two years.

It will be made under Section 7 of the act, through two large banking institutions on the Pacific Coast, to the Northwestern Electric Company, Portland, Ore. The loan will be made on the notes of the bank, secured by first mortgage bonds of the company, supported by other collateral in accordance with the requirements of the act.

The additional power to be generated through the extensions and enlarged operations of the electric company will be used in connection with shipbuilding.

This loan being made through banks, the rate was fixed at 6 per cent per annum.

Applications for the issue of securities aggregating \$478,458,386 were considered by the capital issues committee of the Federal Reserve Board. The committee's existence ceased upon the taking of office on May 17 of the Capital Issues Committee created by the War Finance Corporation act.

New issues approved reached an aggregate of \$154,102,224. New issues for the same period last year were \$504,211,624, so that a comparative saving has been effected of \$350,109,399. This saving by action of the committee does not include the saving of \$19,865,000 effected through informal postponement for the period of the war, secured through the efforts of the committee or its agencies. In addition, however, there is an immeasurable saving caused by the wide publicity given to the committee's aims and purposes, which has discouraged at the very source issues clearly incompatible with the national interest.

The committee attributes this success to the splendid co-operation and loyal support it has received from state and municipal authorities, departments of the federal government, the leading stock exchanges, the American Bankers' Association, and the Investment Bankers' Association of America.

Detailed report made by the committee is as follows:

	Municipal	Public Utility	Industrial
Number considered	192	62	107
Number approved	140	60	78
Number disapproved	34	2	24
Number curtailed	18		5
Amount considered	\$86,878,512	\$172,069,605	\$219,510,269
Amount disapproved	19,791,665	6,000,000	39,900,000
Aggregate approved	\$67,086,847	\$166,069,605	\$179,610,269
Less "refunding"	21,392,312	125,860,284	111,411,900
Aggregate new issues	\$45,694,534	\$40,209,321	\$68,198,369
New issues last year, same period	108,952,865	107,504,075	287,754,684
Analysis of new issues ap- proved:			
Amount original applica- tions	\$65,486,199	\$46,209,321	\$108,098,369
Amount approved	45,694,534	40,209,321	68,198,369
Curtailement effected	\$19,791,665	\$6,000,000	\$39,900,000
Analysis of applications in- formally discouraged:			
Number	8	3	6
Amount	\$8,915,000	\$7,360,000	\$3,590,000

OFFICIAL PRIORITY ORDER ON POWER IN ILLINOIS

Illinois Public Utilities Commission Takes Steps to Conserve Remaining Central-Station Power for Munition Manufacturing

In the case of the Central Illinois Light Company of Peoria before the Illinois Public Utilities Commission for temporary suspension of the rules governing free extension of electric service lines, the commission has taken rather interesting action. In the presentation of the testimony it appeared that the Central Illinois Light Company has ordered and expects to obtain additional equipment for its plant before the coming winter, but that such equipment if obtained will not provide sufficient reserve capacity to enable the company to meet adequately the demands which it anticipates for service.

Under these conditions the company appears to be faced by the necessity of either refusing to supply those industries, which in its opinion are essential for the prosecution of the war, or of refusing to serve lighting customers, and it appears possible that in either event a discontinuance of certain portions of its service during the temporary periods of heavy loads may prove necessary. While the load which might be occasioned by additional lighting customers may not be a large proportion of the company's entire capacity, it certainly represents a large proportion of the capacity which is at the present time available for meeting the situation.

The commission, recognizing this situation, saw itself confronted with the problem of whether under these circumstances the needs of the war should be given precedence over the needs of private consumers, to whom the service represents only physical comfort which in most cases may be provided very nearly as well by other means. The commission took the position that, under the conditions existing in this case, ordinary patriotism demanded that the reasonable requirements looking toward the successful prosecution of the war should receive first consideration and that, following these demands, service required for private consumers should receive attention.

The commission therefore ordered the Central Illinois Light Company "to refuse to render electric service

to additional consumers except as hereinafter provided without first securing the specific approval of the commission," and to "refuse additional service to existing consumers except in cases where the maximum demands of such additional service will be less than 10 per cent of the maximum demand at present being served," and ordered further that "such increases to the amount of 10 per cent to such consumers shall not be furnished at times more frequent than every six months. The Central Illinois Light Company may render power service, including incidental lighting, to new consumers, or increase without restriction the service rendered to existing customers (except residences, stores or offices) who are in classes exempted from the order of the United States Fuel Administration issued Jan. 17, 1918, and subsequent modifications and explanations thereof, and may render service to such other consumers as shall secure from the United States Fuel Administration, the United States Food Administration, the United States Department of War or the United States Department of the Navy a statement that the products which it purposes to manufacture are necessary for the successful prosecution of the war."

The commission also ordered the Central Illinois Light Company to get in touch with other nearby public utilities with a view to securing power for interconnection and to make a survey of isolated plants which might be tied in with the system. The company was also authorized to demand deposits from petitioners seeking extension of distribution circuits.

Winning the War

"Don't you like your bill?"

"It is not so large as it might have been. The government has prevented runaway prices."

"My friend, it is now your turn to do your part. Are you teaching your men to burn the coal efficiently?"

PLANS TO FURTHER THE CONSERVATION OF FUEL

Federal Fuel Administration Arrangements Include Moving-Picture Lessons, Official Bulletins and Constructive Engineering Assistance

In connection with its work in promoting fuel conservation the Federal Fuel Administration recommends that a board of competent engineers be attached to the conservation committee in each state; also a corps of lecturers to arouse public interest and disseminate engineering information.

The Fuel Administration has prepared a fifty-minute film of moving pictures showing good and bad operation in the steam-boiler plant, methods of testing boilers, fuels, etc. These pictures will be available for each state in connection with its educational propaganda.

The administration is also preparing a series of official bulletins on engineering phases of steam and fuel economies. Some of these are now ready for printing. They will include:

1. "Boiler and Furnace Testing."
2. "Flue-Gas Analysis."
3. "Saving Steam in Heating Systems."
4. "Boiler-Room Accounting Systems."
5. "Saving Steam and Fuel in Industrial Plants."
6. "Burning Fine Sizes of Anthracite."
7. "Boiler-Water Treatment."
8. "Oil Burning."
9. "Stoker Operation."

In addition to this service, a list of competent engineers has been prepared in Washington for each state and is available for use of each local administration. As the work develops, still further constructive assistance is contemplated for helping owners to bring their plants up to a high plane of operation with due attention to both economy and efficiency.

NATIONAL RESEARCH COUNCIL HAS PART IN WINNING WAR

At a Meeting of the Engineering Foundation Dr. George E. Hale Tells the Objects and Accomplishments of This Body of Scientists

That every feasible means of research will be used in all branches of industrial engineering and science in order that the war can be efficiently prosecuted was made clear by Dr. George E. Hale, chairman of the National Research Council, before the May 28 meeting of the Engineering Foundation in New York. The three primary objects of the council will be the advancement, promotion and utilization of industrial research. This work will be carried out by leading industrial, military and naval engineers.

The Research Information Committee has been established in Washington, London and Paris for securing, classifying and disseminating technical information. It will develop contact with research laboratories abroad and send in reports of advances in science and engineering.

The Research Council is made up of two main branches—one devoted to the physics and latent sciences and the other dealing with engineering problems. These branches are headed by very eminent men in the respective fields. The engineering division

is subdivided into a number of committees each having its own particular field to cover.

Dr. Hale told of a few of the things that the council has done and of the important part that its study in geology, psychology, chemistry, facilitation of Patent Office work and assisting educational institutions has played. He told of a development made in nitrogen fixation by a student of the Massachusetts Institute of Technology that would reduce the cost of production considerably.

Dr. Hale commended the work of the Engineering Foundation and of the national engineering societies in establishing the Research Council on a war basis. He also read a letter sent to the council by President Wilson with reference to its work and the importance of its objects.

A HEATING APPLIANCE SECTION IS FORMED

Preliminary Meeting Held at Office of the Associated Manufacturers of Electrical Supplies, New York—Temporary Organization Effectuated

At a meeting at the office of the Associated Manufacturers of Electrical Supplies, New York, on Tuesday of this week manufacturers of heating appliances decided to form a Heating Appliance Section. The meeting was a preliminary one, and it will be followed by another at an early date at which permanent officers and committees will be elected.

F. D. Goode, Cutler-Hammer Manufacturing Company, presided as temporary chairman. Harry S. Mirrieless of Manning, Bowman & Company was temporary secretary.

SECTION MEETINGS OF THE ASSOCIATED MANUFACTURERS

Seven Sections Are to Meet at New London, Conn., from June 26 to 29—Board of Governors May Also Meet

Seven sections of the Associated Manufacturers of Electrical Supplies will meet at the Griswold Hotel, Eastern Point, New London, Conn., from June 26 to 29. The plan of holding the meetings in this way will greatly facilitate the work. The seven sections are:

Attachment Plug Section; chairman, H. W. Bliven, Harvey Hubbell, Inc.

Fuse Section; chairman, H. R. Sargent, General Electric Company.

Knife Switch Section; chairman, J. H. Trumbull, Trumbull Electric Manufacturing Company.

Lamp Receptacle and Socket Section; chairman, W. D. Steele, Benjamin Electric Manufacturing Company.

Outlet Box Section; chairman, F. W. Hall, Sprague Electric Works.

Panelboard and Switchboard Section; chairman, C. L. Eidlitz, Metropolitan Electric Manufacturing Company.

Snap Switch Section; chairman, E. Whitmore, Manhattan Electrical Supply Company.

The governors are much interested in these meetings and contemplate holding their June meeting during the same week and at New London. A large attendance is expected.

ARKANSAS UTILITY MEN HAVE PATRIOTIC MEETING

Food, Fuel, Red Cross and Thrift Stamp Activities
Claim Precedence Over Papers on
Technical Topics

Patriotism was the underlying theme of the eleventh annual convention of the Arkansas Association of Public Utility Operators at Hot Springs, Ark., May 21, 22, and 23. Ringing addresses were delivered by Hamp Williams, State Food Administrator; by J. F. Cristy, of the Jonesboro Water & Light Company, for the Fuel Administration; by George R. Wyant, assistant in the State distribution of thrift stamps; by Mayor J. W. McClendon of Hot Springs, and by George R. Belding, secretary of the Hot Springs Business Men's League.

The convention was not particularly well attended by operating men on account of the fact that in several of the principal centers of the State station loads have doubled in the last six months so that the efforts of every available man are required to maintain service. The realization of this situation caused the association to decide to postpone the convention, and notice to this effect was sent out about ten days before the date of the meeting. This notice was later countermanded by telegraph, however, owing to the storm of protest it developed from those who believed a convention should be held for the discussion of timely topics.

Among the technical papers and discussions the question of rate increases evoked greatest interest. A. Patterson of the Southwestern Gas & Electric Company summarized in a broad and general paper the situation in which operating costs are rising and revenues are remaining stationary. His paper was enthusiastically received. Discussion of it brought out that in Arkansas the fact that there is no commission makes the matter of advancing rates a local question in which each company has to be guided by local considerations.

Where a company has local existing franchise agree-

ments which control rates it was thought best to give the rate increases which were being asked for as much as possible of frank and open publicity. Attention was also called to the advantage of asking for a surcharge on lighting schedules and straight increase on power schedules in cases where the proposed raise in rates is given great publicity in order to lessen curtailment of service.

The following methods of increasing revenue prior to asking for a general increase in rates were also brought out: (1) Elimination of special contracts made long ago at low rates; (2) checking meters; (3) rechecking maximum demands, and (4) adding a fuel clause to existing contracts. Those who took part in the discussion were E. T. Selig, Harrisburg, Pa.; L. C. Spake, Chicago; J. S. M. Wharton, Helena, Ark.; A. E. Murray, Malvern, and S. E. Dillon, Hot Springs. At a later discussion of the same topic C. J. Griffith, Little Rock, urged the operators not to be backward in putting before the local regulatory bodies or the public such demands for higher rates as are necessary to maintain the properties. He also summarized the recent financial troubles of the Little Rock company. It had \$400,000 of gold notes coming due on Dec. 1, 1917. The financial situation made renewal of notes or receivership the only alternatives. Some additions were made to the issue so that the new loan amounted to \$600,000. This cost the company \$60,000. This is one of the reasons, he said, why the company is asking rate increases.

PROJECTED STATE UTILITY COMMISSION

The probability of Arkansas having a public utilities commission was also discussed. D. C. Green of Fort Smith said that it might be expected that either through a provision in the State's new constitution or by a special bill the Legislature would make provision for a commission at the session of the coming winter. He urged the central-station men to co-operate to get a public service commission law adaptable to the conditions of Arkansas and containing provisions for the indeterminate franchise and the certificate of convenience and necessity. The general sentiment of the convention seemed to favor commission rule rather than local regulation.

Other papers presented were on "Uniflow Engines," by F. M. Beeson of the Merkle Machinery Company, and on "Courtesy to Traveling Salesmen," by W. R. Herstein of Memphis, read by W. A. Munding of Memphis. These were not discussed.

Election of officers for the ensuing year resulted as follows: President, D. C. Green, Fort Smith; first vice-president, B. C. McKinnon, Eldorado; second vice-president, E. T. Leverett, Conway; secretary-treasurer, W. J. Thorp, Little Rock. The Class B members, the salesmen, elected as their officers: President, G. M. Ellis, district manager of the supply department of the General Electric Company, St. Louis; first vice-president, W. P. Holcombe, Maloney Electric Company, St. Louis; second vice-president, E. C. Brown, Ohio Brass Company; secretary-treasurer, C. C. Lewis, Columbia Lamp Division of the General Electric Company, St. Louis. The next convention will be held at Fort Smith.

A shorter name, the Arkansas Public Utilities Association, was adopted.

Associations and Societies

The Directory of Electrical Associations, which is regularly printed in the first issue of each month, appears on page 1171 of this number.

Independent Electrical Contractors' Association of Greater New York.—On July 13 the Independent Electrical Contractors' Association of Greater New York will hold its annual meeting at Mitchell Park and Hotel, Grant City, Staten Island. Representatives from all branches of the electrical industry are expected to be present.

Electric Club-Jovian League of Chicago.—At the May 23 meeting of the Electric Club-Jovian League of Chicago Phil A. Grau, member of the Chicago Association of Commerce and the United States Chamber of Commerce, gave a very interesting address on "American Business and the War." W. T. White and C. M. Converse of White & Converse, electrical jobbers of Minneapolis and St. Paul, were present and spoke of conditions in that section.

Joint Meeting of Engineers in Chicago.—A joint meeting of the Chicago Sections of the American Institute of Electrical Engineers, the Illuminating Engineering Society and the Electrical Section of the Western Society of Engineers was held on May 27. F. A. Vaughn of the Vaughn & Meyer Company, consulting engineers of Milwaukee, who designed the new street-lighting system in that city, gave an interesting description of the novel methods of distributing energy to the street lamps that were used.

Inventors' League of the United States, Inc.—In a discussion at a recent meeting of the Inventors' League of the United States, Inc., at New York it was brought out that the function of the league is not to sell patents except those placed in its hands for exhibition to inquirers, but is rather to advise inventors how to protect their interests in various ways, as, for example, by having contracts with capitalists interested in their invention properly drawn. It was pointed out that the inventor is really the best one to approach manufacturers in behalf of his invention as he is more familiar with its merits than any one else.

A. S. M. E. Annual Spring Meeting.—As previously announced in the ELECTRICAL WORLD, the spring meeting of the American Society of Mechanical Engineers will be held in Worcester, Mass., on June 4, 5 and 6. Among the important papers to be presented will be "Converting a Factory for Munition Manufacture," "Fire Protection," "Training Labor for Shipbuilding," and "Oil Fuel in New England Power Plants." "Efficiency of Gear Drives" will be presented by C. M. Allen and F. W. Roys. "Electric Heating Molds" will be discussed by Harold E. White,

and A. A. Potter will deal with "Investigation of the Fuel Problem in the Middle West." The fuel conservation committee of the Engineering Council has arranged a practical discussion of fuel economy.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

War Conditions and Rate of Return.

—A decision of the Illinois Public Utilities Commission affecting gas rates of the Monmouth Public Service Company says in part: "The commission is of the opinion that in matters involving rate increases of a temporary nature due to abnormal conditions such as now prevail because of the present war the amount prudently invested in a public utility property should be given the most serious consideration when determining reasonable rates, for upon such investment common justice demands a fair return. It must not, however, be understood that the public should bear all the burden of the increased costs of labor and materials, but only its just proportion, for in times of stress such as those now confronting us each should make some sacrifices for the general good, and to this a public service corporation is no exception. . . . It may be conceded that petitioner is entitled to a reasonable return upon the fair value of the property devoted to the public service. What this fair return may be will vary under different circumstances and will depend upon local financial conditions, the hazards connected with the business, the nature of the service and other factors of more or less importance in specific cases. This commission has heretofore taken the position that financial rewards in public utility enterprises should be commensurate with the ability displayed in their management, and rates of return approximating 7 per cent have been frequently permitted in cases wherein the stewardship appeared competent. In the case at bar the record discloses that normal ability has not been displayed in the management of petitioner's gas property and the standards of service have not been complied with, and to assume that mediocre stewardship is entitled to the same rewards as capable conduct of affairs is to enunciate a doctrine at variance with the sum of human experience and with principles well recognized in the business world. Therefore, taking into consideration all the facts disclosed by the evidence in this case and for the purpose of arriving at increased rates, the commission is of the opinion a fair rate of return upon the value of petitioner's gas property may be considered as 6½ per cent."

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Assessment of Both Stock and Personal Property.—A municipality cannot, in the absence of express authority, assess personal property of telephone companies, it being the policy of the State not to assess both the stock and the property, the Court of Appeals of Maryland held (103 A. 133).

Contracts Without Time Limit.—Where contracts fixing a rate "unlimited" in time have been entered into by public service companies, the State has the right through the Public Service Commission, notwithstanding the contracts, to inquire into and adjust the rate to a reasonable basis, according to the Supreme Court of Pennsylvania (103 A. 287).

Condition of Premises.—Where unguarded wires carrying a high voltage of electricity were dangerous, it was negligent to leave them unguarded, if they were so placed that a reasonable man would anticipate that they would cause injury to one rightfully on the premises, according to the New York Supreme Court (169 N. Y. S. 984). In an action for injury to employee, invited to defendant's factory upon a business in which both defendant and employer were interested, because of a shock from wires, evidence held not to support a finding that defendant was negligent in not anticipating that injury might result from the condition of the wires, unguarded either by material construction or by providing sufficient warning.

Contract Rights Under Charter.—The law provides that any company organized to build dams or to construct and maintain canals, etc., to carry water to any plant or power house where electricity is generated or to erect and maintain lines to carry and transmit electricity, etc., may appropriate as much private land as is deemed necessary for its pipe, poles, tanks, reservoirs, etc., as well as land overflowed. It was held by the Supreme Court of the United States (38 S.C.R. 244) that a corporation organized under the general laws to construct and operate a power system acquired by its incorporation no contract right protected from impairment by Article I, Section 10, of the United States Constitution to have the quantity of water available for development by it undiminished. If a power company by eminent domain or otherwise acquires riparian lands or specific rights in the use and flow of water from riparian owners, these constitute property acquired under its charter, and not contract rights expressed or implied in the grant of the charter.

W. A. Layman, president of the Wagner Electric Manufacturing Company, has been chosen to serve on the board of directors of Washington University.

S. B. Matson, assistant sales manager for the Marron Electric Company, Rock Island, Ill., has resigned his position and has gone to New York to prepare for Y. M. C. A. service overseas.

J. H. Van Brunt, president-elect of the Missouri Association of Public Utilities, is vice-president and general

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

David W. Brunton of Colorado, who was chairman of the war committee of technical societies, the formation of which was initiated by the Engineering Council, has been elected a member of the Naval Consulting Board.

Prof. L. J. Corbett, head of the electrical engineering department of the University of Idaho, has been commissioned a captain in the Engineer Reserve Corps and is now stationed at Camp Lee, Va. Professor Corbett has been at the head of the electrical engineering department of the university for the past seven years.

R. M. Hodgson, formerly associated with the Philadelphia office of the General Electric Company, has been elected a director and the vice-president and general manager of the Binghamton (N. Y.) Light, Heat & Power Company, succeeding P. A. Staples, resigned. Mr. Hodgson has also been elected the second vice-president and general manager of the Sayre Electric Company and will be in full charge of the operation of both companies.

P. A. Staples, vice-president and general manager of the Binghamton (N. Y.) Light, Heat & Power Company and general manager of the Sayre Electric Company, has resigned to become associated with Lewis A. Riley, 2d, mechanical and gas engineer, 103 Park Avenue, New York City. Mr. Staples became manager of the Binghamton property late in 1916, having been a few months previously transferred from the Sandusky (Ohio) Gas & Electric Company, where he was a vice-president, to Dover, N. J., as vice-president and general manager of the New Jersey Power & Light Company.

M. C. Turpin, formerly assistant to the manager of the department of publicity, Westinghouse Electric & Manufacturing Company, has resigned to enter federal service as assistant to manager, Technical Publicity Bureau, Ordnance Department. Mr. Turpin's work will be on the dissemination of information from the War Department to manufacturers through the medium of the trade press. Mr. Turpin is a graduate of the Alabama Polytechnic Institute and of Cornell University. After several years' experience in the construction and operation of central-station plants he entered the Westinghouse department of publicity in 1909.

Samuel Kahn, president-elect of the Pacific Coast Section, N. E. L. A., is vice-president and general manager of the Western States Gas & Electric Company, Stockton, Cal. Mr. Kahn was born Oct. 18, 1882, at San Antonio, Tex. He received his early education

at the San Antonio Public School and in 1898 entered the University of Texas, where he remained for two years, when he entered Purdue University, from which he was graduated in 1903 with the degree of bachelor of science from the School of Electrical Engineering. During the next six years he was engineer for the San Antonio Gas & Electric Company and the San Antonio Traction Company. From January, 1909, to May, 1911, he was

J. H. VAN BRUNT

manager of the St. Joseph (Mo.) Railway, Light, Heat & Power Company. He is a native of New Jersey. Twenty-nine years ago he purchased the street railway utilities in St. Joseph. Since that time he has been continuously in charge of that company and its operation in the street railway, light and power field.

J. E. Torrence, who has been manager of the Green (S. C.) branch of the Southern Public Utilities Company for the last five years, has resigned to enter the army.

W. E. Hewitt, formerly connected with the municipal light and water works of Douglasville, Ga., has been appointed superintendent of the municipal water and light plant at Sandersville, Ga., succeeding L. J. Porter.

C. H. Davis, general superintendent of the Marlboro (Mass.) Electric Company and manager of the Westboro (Mass.) Gas & Electric Company, has been appointed manager of the Westfield municipal gas and electric light works.

George W. Schmidt has been appointed chief engineer of the Northern Ohio Traction & Light Company's power plant at Akron. Mr. Schmidt began his career in the electrical industry in the mechanical department of the Union Electric Light & Power Company, St. Louis, where he remained for eight years. He was then appointed chief engineer of the power station of the company and served in that capacity for five and one-half years. Mr. Schmidt resigned from the company in St. Louis on March 1 to become connected with the Northern Ohio Traction & Light Company.

SAMUEL KAHN

general manager of the Union Light, Heat & Power Company of Fargo, N. D. In 1911 he became connected with the Appalachian Power Company, Bluefield, W. Va., as general manager, remaining until January, 1912, when he became assistant to vice-president of H. M. Byllesby & Company, with headquarters in Chicago and Tacoma, Wash. He continued this work until May, 1913, when he became vice-president and general manager of the Western States Gas & Electric Company, which position he has held continuously ever since.

Obituary

David Rankin Craig, who for some time conducted an electric supply business on Summer Street, Boston, died recently in his sixty-fourth year. Mr. Craig retired from business about nine years ago.

Edward Clarence Meier, president of the Heine Safety Boiler Company, died on May 7 at the age of forty-eight years. Mr. Meier was engaged from boyhood in the manufacture and sale of boilers. Upon the death in 1916 of his father, Col. E. D. Meier, who founded the Heine Safety Boiler Company, he became president of the company.

W. H. Carnahan, assistant treasurer of the Illinois Traction System, died at Champaign, Ill., May 18, at the age of sixty-two. He had been associated with William B. McKinley, president of that company, for forty years in various undertakings, and had been assistant treasurer of the Illinois Traction System and its component lighting and power companies for fifteen years.

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

DETAILED FIGURES OF ELECTRICAL EXPORTS

Canada Takes Largest Amount, with United Kingdom Second, France Third, Italy Fourth and Brazil Fifth

Detailed figures on electrical exports for the fiscal year ended June 30, 1917, are published for the first time on the opposite page. These figures, which were compiled by the Bureau of Foreign and Domestic Commerce, show the exports of electrical goods by principal items classified according to the countries of import.

A study of the table shows that Canada stood first in consumption of American electrical goods with a total of \$9,926,311, United Kingdom (England, Ireland, Scotland) second with \$7,200,634, France third with \$4,244,252, Italy fourth with \$3,268,307, and Brazil fifth with \$2,351,210.

The total exports to South America were \$8,292,571.

Out of total exports of \$52,158,773, \$26,404,077 went to the allied countries of Great Britain (including Canada), France, Italy and Japan. Less than 50 per cent went to the remaining countries of the world.

LIMITATIONS PLACED ON EXPORTS TO ALLIES

Boilers and Tubes, Copper Wire and Cable and Carbon Electrodes Come Under Latest Ruling of War Trade Board

The War Trade Board announces that for the purpose of preventing the useless consumption of materials and labor in making articles for export which for the present may not be exported, and for the purpose of saving tonnage by prohibiting the exportation of articles which have not been recommended by the government of the country of destination as being necessary for its essential requirements, the War Trade Board has adopted the following additional rules and regulations with respect to the issuance of licenses to export any commodity to the United Kingdom, France, Italy and Belgium (excluding their respective colonies, possessions and protectorates):

On and after May 15, 1918, applicants, before filing applications for licenses to export any commodity to the above-named countries, must obtain thereon the written approval of the mission in the United States of the country to which the exportation is to be made. To secure this approval applicants should forward their applications, duly executed in triplicate, with proper supplemental sheets attached thereto, including Supplemental Sheet X-11 or X-12, as may be required, to the British War Mission, Munsey Building, Washington, D. C., for shipments to the United Kingdom; the French High Commission, 1954 Columbia Road, N. W., Washington, D. C., for shipments to France; the Italian High Commission, 1712 New Hampshire Avenue, N. W., Washington, D. C., for shipments to Italy, and the Belgian Commission, Room 202, Council National Defense Building, Washington, D. C., for shipments to Belgium.

Applicants will be required to agree with the War Trade Board not to purchase or acquire for export or take any steps in the process of producing, manufacturing or fitting for export the articles specified in the application until an export license has been duly granted.

Shippers of articles contained on Schedule A will also be required to agree that, after export licenses have been issued, they will not make any purchase or acquire for ex-

port, or take any steps in the process of producing, manufacturing or fitting for export, the articles specified in the application unless they first obtain the written approval of the War Industries Board.

Included under schedule A, among other things, are asbestos, high-pressure steam boilers, carbon electrodes, copper wire and cable and boiler tubes.

THE GOVERNMENT IS NOW RECOGNIZING THE JOBBERS

Inability to Obtain Priority Orders for Stock Replenishment Is Proving a Source of Embarrassment

Six months ago the electric supply jobbers were considerably worried because the government was not giving them more recognition when placing orders. Orders were more generally placed direct with the manufacturer notwithstanding the existence of a nearer supply in some jobber's warehouse.

Recent events indicate that this situation has changed materially in the meantime and that the government now recognizes the worth and value of the jobber. The government is drawing more and more on jobbers' stocks. In some regions almost the entire jobbing trade is in war orders, a large part of which are directly government orders.

The shipyards, railroads and army and navy departments now appreciate the value of having available stocks close at hand without having to wait for shipments from manufacturers.

The one great difficulty that is met is in the question of priorities. Government contractors can requisition jobbers' supplies on priority orders. Jobbers, on the other hand, do not have recourse to priority orders to replenish their stocks. Priority orders can be secured by the jobber only on orders for which the purchaser has a priority.

This latter situation frequently proves to be embarrassing when the jobber must take the customer's priority to the manufacturer. Had the jobber been able to replenish his own stock through priority orders the frequency of such cases would undoubtedly be eliminated.

WAR ABSORBS THE ENTIRE OUTPUT OF METAL CONDUIT

Shipbuilding Takes More Pipe than Was Originally Anticipated—Factories Are Behind in Their Shipments

Metallic conduit and conduit fittings are now in such a position that it is impossible to obtain deliveries without showing that the material is required for a project necessary toward the successful waging of the war. Manufacturers in order to secure pipe must show the ultimate use of the conduit. It will therefore be impossible, one of the manufacturers stated to a representative of the ELECTRICAL WORLD, for a contractor or jobber to secure new pipe after the present supply is exhausted, except for industrial purposes or such other purposes as are definitely linked up with the war.

The available supply of pipe is by no means sufficient to take care of the market. The shipbuilding program of the United States has taken a very large amount of conduit, much larger in fact than was previously anticipated. Fac-

tories are behind in shipments, but find themselves in no position to better the situation at present.

A number of cars are known to be on their way to different sections of the country, but local stocks cannot be benefited except when embargoes are raised. In such cases a carload or two generally get in, but this does not satisfy the local demands. It does, however, ease up conditions.

This situation in conduit came as a result of the manufacturers in the iron and steel industry pledging their entire output to the service of the government and our allies so long as required. The direct and indirect requirements of the United States and its allies, it is stated, are equivalent to between six and eight months' production. As a result commercial iron and steel for the moment are receiving no attention. This situation, of course, will continue as long as 100 per cent of the production is necessary for war purposes.

THE AUTOMOBILE MARKET FOR ELECTRICAL GOODS

Demand for Second-Hand Cars Creates New Market with Increased Demand in Spite of Curtailed Car Production

The curtailment of pleasure automobile production is of considerable importance to the electrical trade. It was but a year and a half to two years ago that many electrical factories supplied their entire output to automobile manufacturers. Early in 1916 certain wire factories in the East were known to be working day and night on wire for pleasure automobiles.

Automobile lamps, wire, batteries, starting and lighting dynamos, instruments and wiring devices and accessories are purchased in large quantities for automobiles. However, the demand for electrical equipment for this purpose has by no means fallen off proportionately with the curtailment of new car production. In fact, there are indications of an increase. Owners of second-hand cars are creating a market. Second-hand cars are in much greater demand and therefore are bringing better prices to-day than ever before, and the demand for electrical starting and lighting equipment for used machines is growing rapidly.

It is well known that lamp manufacturers are having difficulty in keeping up with the demand for automobile lamps. Local stocks are low and there are many complaints regarding the difficulty in obtaining a supply.

Battery manufacturers state that the demand is being maintained. In fact, one of the large Eastern producers of storage batteries for automobiles states that the sales during the month of May have been phenomenal and that as a result the capacity of its plant is being taxed to the limit. In spite of all efforts to keep production up to the demand, this factory is finding that it is becoming more and more difficult to anticipate deliveries with reasonable accuracy. The total sales of this concern to date far exceed those of the first five months of 1917.

MOVEMENT FOR ADOPTION OF A NATIONAL TRADEMARK

A Bill Now Before Congress Is Aimed to Defeat Piratical Methods of Local Merchants in Foreign Markets

A movement is on foot toward the adoption of a national trademark. A bill on this matter is now before Congress. The need for such a designation of American-made goods in foreign markets is owing to the "piracy of private trade in foreign markets," according to Chauncey P. Carter of the Bureau of Foreign and Domestic Commerce, who had an important part in drafting the bill.

American trademarks are frequently registered in a foreign market by some local merchant before the American goods are placed in that market. The American merchant then finds his own trademark useless, so far as he is concerned, in that country.

"If we had a national trademark, owned and protected

by our government, this American manufacturer," said Mr. Carter, "could outwit the pirate merchant by merely substituting the national trademark for his private mark on all shipments to that country."

COMMERCIAL BRIBERY MAY BECOME CRIMINAL OFFENSE

The Federal Trade Commission Urges Enactment of Law in Order to Preserve Free and Open Competition

The Federal Trade Commission has recently sent to both branches of Congress a communication urging "the enactment in the public interest, as an aid to the preservation of fair and free competition, a sufficient law striking at the unjustifiable and vicious practices of commercial bribery and that such law be so comprehensive as to strike at each person participating in any such transactions."

The Federal Trade Commission has found commercial bribery to be general throughout many branches of industry, and scores of complaints have been issued by it on that account. Fourteen states at present have laws prohibiting such practices, but they fail to reach the root of the evil and eradicate it—in fact, they are practically dead letters. The commission can only deal with commercial bribery as an unfair method of competition, having no criminal jurisdiction, and can deal only with one side, having no power to reach the receiver.

In its communication to Congress the commission states that it "has made considerable investigation of bribery of employees of customers as a method of securing trade. These bribes take the form of commissions for alleged services, of money and gratuities and entertainments of various sorts, and of loans—all intended to influence such employees in the choice of materials. It is evident that this inexcusable added cost is finally passed on to the consumers.

"Corrupt employees having the power to spoil and disapprove materials have been able to bid one salesman against another until in many cases they have extorted secret commissions, so-called, as large as 20 per cent of the value of the goods sold.

"In order to prevent a resort to a common method of corruption, it is recommended that the law should also prohibit the giving of any such gifts or other considerations to members of the agent's or employee's family, or to any other person for his use or benefit, direct or indirect."

WIRE UNAFFECTED BECAUSE OF RUBBER IMPORT RESTRICTIONS

Electrical Manufacturers Consulted by Government in Advance of Order Limiting Incoming Supply of Crude Materials

An order from the War Trade Board limiting the importation of crude rubber from overseas to a total of 25,000 tons from May 6 to July 31 is apparently not creating any discernible disturbance or concern with electrical goods manufacturers using this material in their finished products. Several leading producers of rubber-covered wire and cable, rubber insulators, etc., when asked if this action would curtail their output or have a tendency to increase prices, said that with the exception of rubber insulators, due to be advanced any day, no trouble was anticipated unless the restricted period was extended longer or indefinitely. Then there would be reason for anxiety.

Wire and cable manufacturers frankly state that rubber had been plentiful and cheap, and every company of any standing had certainly a three months' or more reserve stock of crude rubber on hand. In fact, it is reported that electrical goods producers had been consulted by the government regarding their supply of rubber before the action was taken. Therefore no one would be hampered or have legitimate or trade output lessened in any measurable degree. It is recognized that tonnage is needed more pressing in the prosecution of the war. Consequently no objection or harsh criticism is voiced.

The War Trade Board said in its notification that the "requirements for the production of goods for the United States and allied governments will be met in full. The remainder of the 25,000 tons will be allocated among the manufacturers of rubber products on the basis of their consumption in 1917."

Crude-rubber importers, on the contrary, are in a different frame of mind. A leading concern that has important dealings in crude rubber with the electrical trade was very much perturbed over the situation. The War Trade Board had sent out a questionnaire to the 175 importers of crude rubber, to which 174 responded. It was thus ascertained that on March 31 there were on order or in store 11,224 tons; engaged abroad or en route, 20,754 tons, with a further lot of 14,800 owned by Americans and intended for this market, making a total of 46,778 tons. It was further stated by this importer, who seemed to represent the sentiment of his branch of the business, that the annual (1917) consumption of crude rubber in this country was 169,000 tons. He therefore figured that the 46,000 odd tons in sight in no way could supply the normal demand.

The price of crude rubber established by the government May 8 is 68 cents a pound for upper refined, 63 cents a pound for first late (first milk), 62 cents a pound for red smoke sheets. The producers of electrical goods use all three grades in liberal quantities. Seven years ago Para rubber sold for \$3.85 a pound.

METAL MARKET SITUATION

Copper Stays at 23½ Cents and Zinc Prices Are Fixed Until Next September

As was foreshadowed in this department, the price of copper remains undisturbed. The price-fixing committee of the War Industries Board on May 23 recommended that 23.50 cents a pound in car lots and 24.75 cents a pound, the jobber's price to small consumers, be continued for seventy-five days. This period, which carries it up to August 15, was a slight concession only to the refiners and producers of the metal. The government was evidently satisfied that the profits accruing to the primary handlers of copper were sufficient. It is an open question now, outside of other considerations, whether wire products will be marked up, as was predicted. This advance was predicted on the so-called "sure thing" tip on the governmental increase in the price of copper. Tin is easier.

President Wilson last Saturday fixed the price of zinc for a period until next September as follows: Grade A—12 cents; freight free on board plant, 14 cents; sheet free on board plant, 15 cents. The prices are subject to the usual trade discounts and differentials in effect on Feb. 13 last.

The price was fixed under an agreement with the industry by which producers will not reduce wages. It will be the same for the public, the Allies and the government. The War Industries Board will direct distribution to prevent zinc from falling into the hands of speculators. Producers pledged themselves to exert every effort to keep up production and insure an adequate supply.

THE WEEK IN TRADE

WEEKLY it becomes more and more evident the extent to which the electrical trade is engaged in a war business. Purchases by the utilities are almost at a standstill. Contractors have little to do in the customary channels. New markets, such as shipyards and cantonments, are being opened and are assuming large proportions. New building is large, but it is of a character different from peace times. Shipyards, docks, army depots, arsenals, factories, etc.—these are the high spots of the building market, and the money being invested therein is running into unusually large figures. The demand for electrical goods is naturally keeping pace with this program. Priority orders are now the rule at the factories. Ordinary commercial business is fast disappearing. Even in such an article as fans it now appears that the government is going to become the dominant influence in the market.

Deliveries to government contractors are reported to be getting very much better. No such reports, however, are forthcoming from commercial customers.

Higher prices of 10 per cent on wiring material are the noticeable feature of the week. Other price advances occurred locally.

Further indications of price fixation were revealed a few days ago in the announcement of the government prices on zinc. Indications are that copper will remain for the time being at 23½ cents in spite of an attempt to obtain more.

With the draft board "work or fight" announcement this week labor supply in the useful industries, which include practically all electrical manufactures, ought to become more plentiful. As a result there should be fewer idle manufacturing facilities and somewhat increased production.

NEW YORK

Jobbers and distributors in this territory report a very satisfactory volume of business for the past week. Some concern is being expressed regarding future stock of staples. Factories have their order books pretty well filled for the entire line of electric requisites, and a suggestion of overbuying is derived from a look over the items filed. Under current conditions manufacturers are inclined to scale down the requisitions of some jobbers who are evidently endeavoring to get in their warehouses stocks greatly in excess of their normal requirements. Prices remain unchanged in nearly all lines. Deliveries are poor and uncertain.

Collections are said to be very satisfactory. Credit accommodations are gingerly accorded, particularly on new accounts.

SMALL MOTORS.—Fractional motors are by no means in strong supply. Manufacturers are several weeks behind on orders. The demand is and has been unusually active. No change in prices.

LAMPS.—Notwithstanding the heavy requisitions for standard sizes—beyond the most sanguine estimates of the manufacturers on government orders—the lamp producers are rapidly accumulating stock against future business. Orders are carefully scrutinized, however, and if jobbers are figuring on acquiring surplus stock against speculative contingencies they will be greatly disappointed. Only the regular requirements, beyond providing for a normal expansion of business, will be accepted. Deliveries are fair, with six weeks as the average shipping date. One order for 10,000 "mushroom" lamps was promptly turned down by a manufacturer on account of its peculiar specifications.

CONDUIT.—The market shows no marked improvement. Shipments from Pittsburgh and Youngstown, Ohio, factories dribble in by one and two car loads from time to time,

but no dependence can be placed on these arrivals when dates are considered. The demand is steady, jobbers and dealers exerting every effort to supply the consumer, whose impatience is gradually subsiding as manufacturing and shipping conditions become known.

HOUSEHOLD SPECIALTIES.—The movement of sewing and washing machines, ironers and tableware is brisk. Manufacturers are still behind on deliveries—about three weeks on the Western schedule. Prices are unchanged.

FLOODLAMPS.—On the larger sizes the factories are yet behind on filling orders, some of which represent sales of some magnitude. These are for government use, direct or indirect. Sixty days is about the delivery time on these goods. Some munition plants are sending orders for special colored glass. These the manufacturers would rather "pass up," but, being for war purposes, they are accepted with the best grace possible and promptly delivered.

CREDITS AND COLLECTIONS.—Collections have picked up at least 10 per cent during the past week. The "slow pays" are among the regulars, but being sound and above criticism no anxiety is expressed. Credits are held close to a straight line.

INSULATING TAPES.—The high price of cotton is affecting the cost of tapes. During the past year four advances were made, the latest of 10 per cent occurring a month ago. Varnish, oils, etc., used on cambric tapes are going up, and there is a possibility of another jump in price.

DRY BATTERIES.—A steady demand is reported, with the factories about even on filling orders and deliveries. Prices are stationary.

CHICAGO

The record of jobbers' sales for the first four months of 1918 shows a volume of business practically equal to that for the same period of 1917. There is some evidence, however, that some of this business has been due to unfilled orders carried over from last year and early in 1918. In the southwest portion of the Chicago district jobbers report a decrease in inquiries due to the government's attitude toward the expenditure of capital for even such purposes as small municipal lighting plants. From many sources are heard predictions of still higher prices. News that the United States steel gun plant is to be located in the Pittsburgh district gives promise of some business for the Central West soon. The one large central-station construction job in the Middle West now is the new station of the Kansas City Light & Power Company, to cost \$8,500,000. This work is still in the hands of the foundation builders. The only electrical work in progress is the underground system from the power station to distribution plants.

BOSTON

Business has been well maintained during the week, and credits are in pretty good shape. The central stations are doing a vast amount of war service work, and the industrial plants are constantly being mobilized for needs relating to military or naval activity. Good progress is being made on the government construction programs in this district, and many sales of electrical material to Uncle Sam are registered daily. The labor supply is getting scarcer and is causing jobbers, dealers, manufacturers and contractors no small amount of worry. Transportation conditions show some improvement, but emphasis is being laid by the railroads upon the vital importance of prompt unloading of cars as a war measure. Since winter there has been a slacking off in this which is making trouble. Prices of wiring materials advanced from 5 to 10 per cent last week because of the high cost of labor and porcelain. A vigorous coal-saving campaign is on in New England in anticipation of serious conditions next winter.

APPLIANCES.—Portable lamps and fixtures are very quiet at present, but there is a good market for flashlamps, dry cells, irons and wedding gifts. Some excellent displays of high-class tableware and smaller cooking devices are being featured in appliance showrooms.

FANS.—The rush movement of fans has not yet started among retailers, but any day is likely to bring heavy sales. Stocks are well prepared for eventualities, and liberal buying is anticipated from both industrial and residential users.

INDUSTRIAL ELECTRIC TRUCKS.—Purchases for government or related service are the feature of the market. Prices are firm and deliveries fairly good, considering railroad and raw material conditions. Minor development work is occasionally put through by manufacturers.

LAMPS.—Complaints regarding shortage of lamps are now seldom heard. The use of electric signs appears to be on the increase, but the reduction from last year's service is so marked that stocks do not appear to be suffering to any great extent.

WIRING MATERIAL.—Factory stocks are lower than normally, and little chance to build these up is noted. Very heavy government orders are being handled. Export business is developing under intelligent management. Labor is very scarce as regards fresh and reliable supplies. Porcelain shipments into the factories are now being handled to advantage in some cases by motor trucks instead of by rail, and it is reported that through the scheme of providing a return load for each truck costs are much lower than at first was anticipated.

MOTORS.—Not much change appears in the motor market. Prices are firm, and deliveries, while better on smaller sizes and standard types, show much to be desired in the larger units.

CENTRAL-STATION TESTING MATERIAL.—The domestic market is dull, though some inquiries are still coming in. There seems to be an opportunity here for some manufacturers, at least, to tie up with special government work.

ATLANTA

The volume of business in all lines is generally heavy. Although the sales in irons and heating devices have fallen off, these are offset by increases in other seasonal lines. The paucity of labor is becoming serious. Especially is this true for the unskilled class. The urgent demand by the government for unskilled labor at the coastal cities, together with the high rate of \$3.85 a day, has for the time stripped this section of the fill-in or floating element that has been available during the last few months. A general contract has been awarded by the War Department for the expenditure of \$25,000,000 at Charleston, S. C., covering the construction of warehouses, ammunition depots and terminal facilities.

CREDITS AND COLLECTIONS.—Information at hand indicates that jobbers are utilizing the trade acceptance more than ever, especially for sales made to outlying dealers. Jobbers' collections are not up to the standard of the last few months and a tight rein is being held. The contractors are not discounting bills as they did some time ago. There is very little change in the condition of manufacturers' collections, which have been maintaining a good record.

CONDUIT.—Both black and white rigid in sizes of $\frac{3}{4}$ in. and 1 in. is becoming very scarce. Local stocks are in worse shape than they have been in some time, and no immediate relief is in sight, with the exception of sales made for government purposes, which can be replaced through priority orders.

WIRING DEVICES.—Usual schedule material has advanced 10 per cent within the last week.

WIRE.—Rubber and weatherproof wire have also taken a jump of approximately 10 per cent.

FANS.—While a fan shortage is probable, replies to inquiries made to the jobbers apparently reflect the impression made by Eastern trade opinion. So far there is no visible shortage in this section. The season, however, is advancing slowly, and it is very hard to secure definite information on the local situation.

MOTORS.—A general advance of 10 per cent in the price of motors was registered, beginning the 18th. Isolated heavy buying tends to hold the volume of sales up to the figures of the last few months, but the uniform demand has

slackened perceptibly. Some improvement is noted in shipment promises of the larger ratings.

CHARGING OUTFITS.—Manufacturers and jobbers report an excellent business and increasing volume of sales. One manufacturer states that the sale of outfits in the Southwest is well up with the volume of business being transacted in the more populous northern sections of the country. Shipments are very satisfactory in comparison with other lines.

SEATTLE

General business conditions continue highly satisfactory according to both wholesalers and retailers. Business is as usual, in spite of the second Red Cross fund drive, in which Seattle territory more than doubled its allotment. Sales to shipyards and domestic sales maintained former high levels, although no particularly large sales were recorded. Further large power apparatus and equipment are anticipated in the near future from Tacoma, Gray's Harbor and Columbia River shipyards to care for projected improvements and enlargements. The market for large generators and larger-sized motors was comparatively dull during the past ten days. Schedule materials, wiring devices, wire, conduit, etc., used extensively by the government at the navy yard and cantonments and at shipyards, are going rapidly. Conduit especially is being turned over as fast as it comes in. Shipments are coming through more slowly, and the stock shortage promises to be acute unless promised shipments arrive. A slight increase in price on wiring devices was noted during the past week.

Possibility of receiving L. C. L. shipments in anything approaching satisfactory time is exceedingly remote. This condition applies to shipments within the State and Northwest as well as from the East. Cases are reported of two and three weeks consumed in receiving shipments from Seattle to Spokane across the State.

Construction immediately of new shipyards and enlargements to established plants indefinitely mentioned heretofore were announced last week. The Northwest Steel Company, Portland, will build an auxiliary steel yard covering 40 acres—four ways. A firm recently closed contracts with the Emergency Fleet Corporation for eight 8800-ton steel ships. The Heffernan Drydock Company, Seattle, plans the immediate establishment of a dry dock, machine, plate and blacksmith shops and outfitting wharves in Seattle. The Pacific Coast Steel Company, Seattle and Portland offices, will establish a five-hundred-thousand-dollar open-hearth furnace and rolling mill in Portland. The plant will have a capacity of 4000 tons per month. The Standard Concrete Shipbuilding Company will build a concrete ship plant near Tacoma. Active construction is promised immediately. Contracts for three scout cruisers and seven merchant ships have been transferred to the Todd shipbuilding plant, Tacoma. The division of transportation, Emergency Fleet Corporation, which looks after transportation of machinery, materials and supplies for steel and wooden shipbuilding, has opened offices in Portland. A residential construction program has been announced by the government for the navy yard at Bremerton, Wash., involving an initial expenditure of \$2,500,000 and ultimately \$5,000,000. One hundred and seventy-five acres have been commandeered, on which will be built 350 houses, two apartments and a 400-room hotel.

Unusual ice conditions in Bering Sea reported in dispatches from the north will necessarily delay shipments of electrical equipment and power apparatus to mines.

Mill and cannery shipments are being rushed to southeastern Alaska points, where they will be relayed into the interior. The acute labor shortage may be further aggravated by the administration's recent order that all men of registration age must work or fight. Shortages in shipyards, mills and factories allied in war work will be relieved, but other lines of business will be left in dire straits.

The supply of lamps in smaller sizes is slowly increasing with approach of summer. A shortage still exists in larger sizes, and automobile lamps are almost impossible to obtain. The demand for the latter is heavy. Flashlamp sales continue excellent, although sales are lighter with passing weeks.

SAN FRANCISCO

The electrical business showed no abnormal features last week, barring some excellent orders for wiring equipment for shipbuilding plants and several big pole orders.

Three steel grain elevators are to be erected in Knight's Landing, big bean-cleaning plants in Sutter and Yolo Counties, and the Union Construction Company is planning the erection of several plate shops in its Oakland Front shipyards. A reflection of the vast commerce with the Orient lies in the report that negotiations are under way by the Toyo Kisen Kaisha Steamship Company for the erection of a six-story office building in San Francisco. An unusual building item among the non-standard items for shipyards and packing plants is the proposed hundred-million-dollar addition to the "White House," one of San Francisco's largest department stores.

A group of Oroville men have announced plans for the erection of a new power-plant project on the Feather River, California, at an estimated cost of \$7,500,000, and the congressional commission appointed to finance industries considered essential to the conduct of the war will be asked to consider it. The plan calls for the construction of a dam 1160 ft. long and 650 ft. high to make a reservoir out of Bald Rock Canyon, giving a total of 1750 ft. capable of developing 166,000 hp.

It is announced that Vallejo will be furnished with a modern street-lighting electrolier system within the present year, and that the city engineers of Fresno will ask for alternate bids for such a system as supplied with cast-iron or concrete poles; that Red Bluff is ready to construct the first six-thousand-dollar unit of such a system, and that the town of La Habra in southern California will be thus equipped.

LAMPS.—Deliveries have slightly slackened during the past week or so. Sales are fine, agents are in good shape, and the business is in excellent condition.

MINIATURE LAMPS.—There are plenty of flashlight lamps, but the embarrassing shortage of automobile lamps still continues. Until new factories are built to cope with this ever-increasing demand, it will be impossible to fill stock orders, the manufacturers realizing that automobile manufacturers must be given preference.

FARM PLANTS.—The sale of farm lighting plants continues better and better, and it is announced that new improved plants with automatic regulation will soon be on the market. The excellent crop prospects will influence many sales for the fall, and the missionary work now being done in addition to present sales will then bear fruit.

TELEGRAPH MATERIAL.—A considerable call is reported for small relays and sounders, and especially for learners' telegraph instruments, due no doubt to the big demand for railroad dispatchers, and especially for radio operators for the navy. All the new vessels now being built for the Emergency Fleet Corporation will require new operators, and a proportionate number of operators must be secured for our ever-increasing navy. These instruments are used for practice by boys and men with such ambitions.

DISHWASHERS.—Although dishwashers have been sold in this district for at least three years past, the demand since the first of the year due to the shortage of household help is easily 1000 per cent over all previous calls. Deliveries are poor.

WASHING MACHINES.—The most popular article of sale just now is the washing machine, which can be had only in small sizes and in dolly styles. Machines of a size for average families are scarce, with no immediate prospect of better conditions. One manufacturer states that he is 3000 machines behind on this standard family size alone. Prices advanced about 10 per cent during the last of April, but this has not influenced sales one bit.

IRONING MACHINES.—The latest labor-saving electrical household device to come into its own is the electric ironing machine. Two prominent makes are being sold on the Pacific Coast and, as the sales reach considerable volume and require time payments by dealers, the representing jobbers are considering a form of financial assistance to them on such sales. The average household size complete with motor sells for about \$110 f.o.b. Pacific Coast.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Small Geared Turbines

To drive small electric lighting outfits, exciter units for large alternators, or for direct mechanical drive, the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has developed a line of small geared turbines, constructed along the line of the larger turbine units, which give durability, ease of adjustment and high economy. These units especially meet the demand for lighting sets in the merchant marine service. They are manufactured in sizes from 15 kw. to 50 kw. for direct-current service and from 30 kw. to 50 kw. for alternating-current service. The turbines are made in 30 hp. to 100 hp. for mechanical drive.

The turbine operates at a speed of 7200 r.p.m. and is suitable for both condensing and non-condensing operation. It is built for normal operation on any steam pressure from 75 lb. to 250 lb. (5.3 kg. to 17.6 kg. per sq. cm.) and for non-condensing operation on any back pressure up to 20 lb. (1.4 kg. per sq. cm.). The generator is of the Westinghouse "SK" type, compound-wound, with commutating poles. The outboard generator bearing is supported by a single-piece bracket bolted to the frame. In this a steel shell lined with babbitt forms the bearing itself, and as it is pressed and pinned into place it may be readily removed or renewed in case of trouble. One of the special features of the unit is the automatic throttle valve, operated directly from the governor by means of a connecting rod. This valve is of the balanced type and very sensitive in operation, thus insuring a close speed regulation.

One of the latest refinements provided on very few small turbines is the

TURBO-GENERATOR LIGHTING SET FOR MARINE SERVICE WITH COVER REMOVED

overspeed governor release. This is a simple device contained in a small hole drilled in the shaft between the pinion and the rotor, consisting of a cylindrical weight held in place by a coil spring surrounding it. In case the turbine should speed up to 10 per cent above normal speed, the weight due to

centrifugal force overcomes the spring tension and protrudes a short distance from its normal position. By so doing it comes in contact with a lug, which in turn is fastened to a lever, the movement of which trips the throttle-valve catch and allows the valve to be closed by a heavy coil spring.

This line of turbo-generators conforms to the Navy Department's specifications for ship service, being provided in this case with both steam and water-sealed glands and non-corrosive brass piping.

Two-Cylinder Motor-Driven Air Compressor

The Midvale Machine Works, St. Louis, Mo., is manufacturing a continuous-service air compressor suitable for garages. It is of the two-cylinder type, having plungers fitted with metal pis-

A 0.25-HP. MOTOR DRIVES THIS COMPRESSOR CONTINUOUSLY

ton rings. The compressor is equipped with an air filter that prevents any oil from entering the tire undergoing inflation. The machine has a capacity of 1.25 cu. ft. (0.038 cu. m.) of air per minute. It is equipped with an 0.25-hp. motor for either alternating current or direct current. Complete with cast base and flywheel, the machine weighs 150 lb. (68 kg.). The manufacturer claims that it will deliver an operating pressure of 100 lb. per square inch. (70 kg. per sq. cm.).

Completely Inclosed Hand Magnet

The magnetic coils, switch and connections of the C-H hand magnet are now covered by two aluminum castings. The upper aluminum casting forms the yoke cover, switch cover and handle support. The lower casting covers the coils and leaves only the soft iron poles projecting. The circuit to the

magnetic coils is closed and opened by means of a large trigger, mounted under the handle in the handle support, which operates a strong make-and-break switch concealed in the upper aluminum cover. The trigger is operated by the index finger. Pulling it toward the handle closes the switch.

DEVICE CONTROLLED BY TRIGGER

When slightly released the switch does not open, but when fully released the switch opens with a quick break. The magnet can be used effectively in plants such as those of metal dealers, smelters and refiners, iron and brass foundries, machinists, paint manufacturers, chemical works, paper mills, fertilizer plants, flour mills, enamellers, tanners, electroplaters, malt houses, hardware dealers, plumbing manufacturers, garages, fixture manufacturers, mathematical instrument makers and shipping departments of many factories. In the manufacture of spelter solder they are used to remove copper-coated iron and steel wire. Suspended with its two poles immersed in the liquid, the magnet will attract to itself any particles of iron or steel in the tubs in which paints, glazes, chemicals, etc., are mixed.

The device described above is manufactured by the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., and is furnished with 5 ft. (1.5 m.) of reinforced cord and a standard C-H separable attachment plug.

Multi-Value Overload Relay for A.-C. Motors

Complete protection against overload is claimed for a multi-value overload relay which is being manufactured by the Monitor Controller Company of Baltimore, Md. The relay has trip coils in two legs of the circuit. In starting, the air gap in the magnetic circuits of these coils is opened to the point where it requires maximum current to trip the overload relay. The main magnetic switch then closes, and the air gap in the overload magnets slowly closes until at about the time the motor reaches full speed the cores are in the

proper position to trip at the current value at which the overloads are set. This makes it possible to set the overload trip with respect to the running load and thus gives complete protection against overload. The current at which the overload relay trips has one value for starting, another for running, and intermediate values during the starting period.

As the overload release may be set for the running load, it gives ample

"ACROSS-THE-LINE" STARTER FOR THREE-PHASE SQUIRREL-CAGE MOTORS

protection against single-phase running. In case one phase fails, the overload in the remaining phase is sufficient to trip the overload relay. The accompanying illustration shows the relay in connection with the main magnetic switch. This combination is known as type 1120 "across-the-line" starter for three-phase squirrel-cage motors.

Armored Corner Insulator for Feeder Cables

Feeder cables can be securely held on curves by the Pittsburgh-type corner insulators marketed by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa. This insulator is provided with a special collar or retaining ring for use where the curve is slight and the cable likely to slip off an ordinary insulator. The collar has an extended lip which curves up around the cable and keeps it in the groove regardless of the angle at which the cable turns, thus eliminating the

NO TIE WIRES NEEDED FOR THIS CORNER INSULATOR

necessity for tie wires and saving time in erection. The collar is free to move on the insulator cap, so that after the insulator is screwed to the pin the collar may be turned until the cable seat is in the best position to support the cables.

For sharp curves the insulator can be used without this collar, as the deep side groove holds the cable firmly in position. These insulators are made of molded insulation surrounded by a

sherardized malleable-iron cap. They are made with a 1-in. (2.54-cm.) pinhold and are furnished in two sizes for feeders of 500,000 circ. mils and 1,000,000 circ. mils respectively.

Flexible Charging Outfit

Charging at a high rate without overheating the batteries can be obtained by means of a commutating rectifier that is being manufactured by the Stahl Rectifier Company, 1401 West Jackson Boulevard, Chicago. Three rectifying commutators with one-quarter of the sections dead produce pulsating currents, which, the manufacturers claim, allows charging at a high rate without overheating the batteries. Because of an independent regulator for each circuit these three circuits can be charged at any rate from 4 amp. to 12 amp. One circuit can be charging one line of batteries at a rate of 10 amp., another circuit can be charging at a rate of only 5 amp., and a third circuit can be

RECTIFIER WITH THREE COMMUTATORS SHOWN WITHOUT BASE

charging at an entirely different rate—all three operating at the same time. It is said that a minimum amount of energy is lost by the Stahl rectifier because the current from the main line is reduced by a transformer and not by resistance to obtain the desired voltage for the commutator. The rectifier model SX is complete with switchboard, voltmeter, ammeter and voltage regulators, all ready to connect up to the main line and batteries. The illustration shows the outfit, which comes mounted on a structural-steel base.

Electric Dubber for Ships

An electric dubber requiring only one operator, perfected and manufactured by Gray & Barash of Seattle, is said to be able to do the work of twenty men working with adzes. In effect, the electric dubber planes the interior and exterior sides of the frames so that a smooth and even surface is presented for the planking and sealing. This work heretofore has been done wholly by hand with the adze. The adze gives a surface of 65 to 70 per cent fair or

even; the electric dubber gives a surface 100 per cent even. As its name implies, this machine is a mechanical means for dressing off the irregular and uneven surfaces of the frames on wooden vessels preparatory to planking.

It employs a cutting member consisting of a rotating cutter head with the knives secured to the face of the head. This cutting head is mounted on the shaft of a specially constructed alternating-current motor running at a speed of 3600 revolutions per minute. The motor, through the means of ball and socket joints, has a three-point suspension within an adjustable carriage, mounted upon two bars which are transverse to the direction of travel. These transverse bars are supported at their ends by arms at one extremity of which are grooved wheels running on annular ball bearings. These wheels ride on the head of a standard 8-lb. (3.6-kg.) "T" rail. Two of the rails form a trackway upon which the dubbing machine is moved. The rails are secured to the surface to be dressed through some convenient means and are sufficiently light to be formed to the contour of the vessel and take the molded shape of the surface to be dressed, thereby determining the finished surface of the part to be dubbed.

The coarse adjustment of the machine is made through a rack and pinion arrangement on the supporting arms, the fine adjustment of the cutter head both as to elevation and angular position being secured through screws working through the three balls and socket joints. The lateral movement along the transverse bars is obtained by the two lead screws manipulated through a removable crank. Through this system of adjustable carriage members the machine is capable of universal adjust-

ELECTRICALLY OPERATED MACHINE CAN DO WORK OF TWENTY MEN

ment within a certain range of movements, enabling it to be operated in a horizontal, vertical or any other position intermediate or between these points.

Trade Notes

JOHN F. GOFFREY, manufacturer of coal handling conveyors, has removed his plant from Elkhart, Ind., to Chicago.

THE CENTURY ELECTRIC COMPANY of St. Louis, Mo., now has its Cincinnati sales office at 510 Traction Building, its Pittsburgh office at 1017 Bessemer Building, and its Chicago sales office at 902 Randborn Building.

W. E. HAWLEY, formerly connected with the George Cutter Company, of South Bend, Ind., in the switchboard department, is now with the Penn Electrical & Manufacturing Company of Irwin, Pa., manufacturer of switchboards and panelboards.

THE NATIONAL TRADE ACCEPTANCE BUREAU, Inc., of New York City, has started to issue the *Trade Acceptance Journal*, which takes for its motto "Sound credit rests on sound finance." The contents of the first (May) number are pertinent and informing. The publication office is 421 Nassau Street.

THE NAVY DEPARTMENT, Bureau of Supplies and Accounts, Division of Inland Traffic, Washington, D. C., under date of May 15, has issued circular No. 5 to navy contractors and navy shipping officers. The subject is recording the movement of carload shipments of certain United States government freight. Twelve different matters are covered in the circular, explanatory and descriptive of freight handled.

LE COMPTOIR NATIONAL BELGIQUE has issued a circular on the "economical reconstruction of Belgium." The organization will aid Belgian business and industries to replenish themselves with material "in the shortest time possible after the evacuation of the country by the enemy." Electric appliances are especially designated, among other articles, as a requisite in the wholesale building. Prices and copies of trade catalogs, specifications, etc., are requested by the Liège Social, 15 rue Louis le Grand, Liège, Belgium.

WASHING-MACHINE FACTORIES IN TORNADO.—The Maytag Company of Newton, Iowa, on May 21 was damaged to the extent of \$75,000 by a tornado. The top floors of this company, as well as that of the Automatic Electric Washer Company, Inc., were partly blown off. A corner of the One-Minute Manufacturing Company was also damaged, one workman being killed and about ten injured. The output of these electric washing-machine manufacturers is but slightly curtailed, and deliveries, it is stated, will be made as usual.

THE MECHANICAL APPLIANCE COMPANY of Milwaukee, Wis., has recently placed C. G. Tarkington in charge of its Washington office, at 1407 L Street N. W. Through this office the company is assisting the government and is in a position to render service to its customers in their relations with the government. Mr. Tarkington was graduated from Purdue University in 1901 and then entered the engineering department of the Cutler-Hammer Manufacturing Company, with which he was connected for a number of years. He was with the Chicago sales office of the Westinghouse Electric & Manufacturing Company for seven years.

THE ELECTRICAL ENGINEERING COMPANY of Chicago was incorporated last December under the laws of the State of Illinois to engage in the design, manufacture and sales of electrical devices, particularly specializing in moving-picture control apparatus, high and low tension transformers and coil winding. R. A. Connor, the president, was formerly connected with the Thordasson Electrical Company as general manager and designing engineer. J. H. Thompson, vice-president, was formerly connected with the same firm as sales manager. G. C. Jensen, secretary and treasurer, has served in several capacities with large central stations.

THE ORDNANCE DEPARTMENT of the United States Army, during April placed orders for the following electric goods with the companies named: Generating units, 4-kw. switchboards complete for 1332 artillery repair trucks, Universal Motor Company, Oshkosh, Wis.; miscellaneous wire and cable for United States filling plant, Simplex Wire & Cable Company, Boston; oil circuit breakers and lightning arresters, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; switchboards and equipment, General Electric Company, Schenectady, N. Y.; No. 10 AWG Colonial copper-clad weatherproof wire, estimated weight 250 lb., Standard Underground Cable Company, Pittsburgh, Pa.

THE LUX MANUFACTURING COMPANY announces that it has surrendered its premises at the Factory Terminal Building, Hoboken, N. J., to the United States government for the benefit of the War Department. The company is now located in its new building at 123-133 East Kinney Street, Newark, N. J. The new building permits an increased production of Lux lamps, and as the result the company says customers may expect better deliveries. Factory operations were not entirely suspended, as a part of the plant was installed before the Hoboken plant was closed down. The company expects to be running at full capacity within at least several weeks. Special attention is being paid to employee welfare at the new plant.

Trade Publications

FANS.—The Century Electric Company of St. Louis has issued a folder illustrating and describing alternating-current fans.

OFFICE EQUIPMENT.—The Manufacturing Equipment & Engineering Company, Boston, is distributing several booklets describing its lockers, drinking fountains, washbowls, etc.

SINGLE-PHASE MOTORS.—The Century Electric Company of St. Louis has issued a circular describing its single-phase motors and illustrating their application to various appliances.

HAND MAGNET.—A light-weight inclosed hand magnet is illustrated and described in publication No. 250, distributed by the Cutler-Hammer Manufacturing Company, Milwaukee, Wis.

STOKERS.—High-capacity stokers for higher volatile coals are described in a booklet issued by the Laclede-Christy Clay Products Company, St. Louis, Mo. The operation of these is given.

MOTORS.—Induction motors are described and illustrated in a circular being distributed by the Cleveland Electric Motor Company of Cleveland, Ohio. The type "M" motors are discussed.

FIXTURES.—Commercial lighting fixtures are described in the *Business Building Bulletin*, distributed by the Beardslee Chandelier Manufacturing Company, 216 South Jefferson Street, Chicago.

INDUCTION MOTORS.—The St. Louis Electrical Works, 4060 Forest Park Boulevard, St. Louis, Mo., has issued a bulletin describing and illustrating its induction motors of single-phase and polyphase type. The publication is known as Booklet 5.

SPEED CONTROLLERS.—Armature speed controllers, type R, of the Ward Leonard Company, Mount Vernon, N. Y., are described in a circular that this company has recently published. Prices are given for all sizes for controlling small motors.

ELECTRIC APPLIANCES.—The two-page advertisements to be run in the June 29 issue of the *Saturday Evening Post* are reproduced in a circular distributed by the Hotpoint division of the Edison Electric Appliance Company, Inc., 5660 West Taylor Street, Chicago.

BATTERIES.—Bulletin No. 169 has been issued by the Electric Storage Battery Company, Allegheny Avenue and Nineteenth Street, Philadelphia, describing its oil-switch batteries. Electrical descriptions are given showing the application of the storage batteries to switching apparatus.

HIGH-TENSION EQUIPMENT.—The Delta Star Electric Company, Chicago, is distributing bulletin No. 33, devoted to high-tension switching and protective equipment. This sixty-four-page bulletin has 309 illustrations and contains considerable technical information. Copies will be sent upon request.

ELEVATORS.—The Standard Plunger Elevator Company, Worcester, Mass., is distributing a bulletin describing its passenger elevators, freight elevators, baggage lifts, sidewalk lifts and hydraulic dumbwaiters, with automatic push-button control for all service. Typical installations are listed in the bulletin. An interesting photograph is reproduced showing a plunger 365 ft. long.

STORAGE BATTERIES.—The Electric Storage Battery Company, Allegheny Avenue and Nineteenth Street, Philadelphia, has issued Bulletin No. 170, describing and illustrating the "Exide" battery for portable signal service. Type KXS and type KCXS batteries are equipped with cases to which handles are attached, thus allowing easy handling. The several parts of the batteries are described and illustrated.

MOTORS AND GENERATORS.—The Crocker-Wheeler Company of Amper, N. J., has issued bulletins No. 183, 184 and 185, describing some of its electrical apparatus. Titles of these bulletins are "Motor Drive for Printing Machinery," "Direct-Current Lighting and Power Generators" and "Coupled and Belt Types of Alternating-Current Generators" respectively. Illustrations and electrical descriptions of the apparatus are contained in these bulletins.

New Incorporations

THE A. S. LAUFERTY COMPANY of Boston, Mass., has been incorporated with a capital stock of \$50,000 to manufacture telephone devices and apparatus.

THE STANDARD BATTERY MANUFACTURING COMPANY of Fort Worth, Tex., has been chartered with a capital stock of \$1,000 by Solomon Casseb, Samuel Greco and Adolph Barbeio.

THE ELECTRICAL EQUIPMENT COMPANY of Morgantown, W. Va., has been incorporated by Arthur Hall, Lester R. Gehagen, Earl E. Hall and others. The company is capitalized at \$25,000.

THE CONSOLIDATED ELECTRIC COMPANY of Taunton, Mass., has been incorporated with a capital stock of \$4,000. The directors are Edward R. Duolos, president; Berton T. Mowry, treasurer, and F. M. Mowry.

THE ELECTRIC KITCHEN CORPORATION of Brooklyn, N. Y., has been chartered with a capital stock of \$30,000 by J. H. Pawling, B. C. Sprague and H. A. Prefethen, 238 Fort Washington Avenue, Brooklyn, N. Y.

THE BURTON-POORE ELECTRIC COMPANY of Norfolk, Va., has been chartered with a capital stock of \$5,000 to do a general electric business. J. M. Burton is president, and E. S. Poore is secretary, both of Norfolk.

THE ARKANSAS BATTERY COMPANY of Little Rock, Ark., has been incorporated by W. P. Galloway, president and treasurer; J. W. Hamm, vice-president, and C. P. Pierce, secretary. The company is capitalized at \$9,000.

THE CARBON COMPANY of Union, N. J., has been chartered by Edward J. Simon, John T. Simon and Myrdon D. Grove of Weehawken. The company is capitalized at \$100,000 and proposes to manufacture incandescent lamps.

THE BOLTON-WECHTEL COMPANY of Brooklyn, N. Y., has been incorporated by H. J. Wechtel and W. C. Bolton, 261 Stuyvesant Avenue, Brooklyn, N. Y. The company is capitalized at \$20,000 and proposes to deal in batteries and auto accessories.

THE THREADLESS PIPE SETTING COMPANY of Newark, N. J., has been incorporated with a capital stock of \$30,000 to manufacture electrical appliances. The incorporators are Joseph G. Fenster, Samuel Lederman and Edward S. Schwartz of Newark, N. J.

THE BROCKMAN BROTHERS COMPANY of Greer, S. C., has been incorporated with a capital stock of \$5,000 to deal in plumbing materials, pumps and gas and electric lighting outfits, etc. The incorporators are J. O. Brockman and R. H. Bearden, both of Greer.

THE STANDARD ELECTRIC & ACETYLENE WELDING COMPANY of Montreal, Que., has been incorporated with a capital stock of \$10,000 to manufacture tools, machinery, implements, etc. The incorporators are Richard T. Henecker, Henry N. Chauvin, Hugh Wylie and others.

THE LIBERTY BATTERY COMPANY of Sacramento, Cal., has been incorporated by James S. Remick, Edward Farmer, Porter C. Anderson, C. E. Winters and C. E. Gass. The company is capitalized at \$10,000 and proposes to establish a general storage battery business and to do, all kinds of electrical work.

THE CLEVELAND ARMATURE WORKS, INC., has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$2,000,000, to manufacture electric machines, generators and batteries. The incorporators are C. L. Rimplinger, M. M. Clancy and F. A. Armstrong of Wilmington, Del.

THE TECHNICAL DEVELOPMENT CORPORATION of New York, N. Y., has been incorporated by F. D. Hearn, J. A. Hanway and J. J. McCormack, 71 East Eighty-sixth Street, New York City. The company is capitalized at \$100,000 and proposes to manufacture and deal in electrical and mechanical equipments.

New England States

WATERVILLE, ME.—Plans are being prepared by I. W. Jones of Milton, N. H., for the construction of a new hydroelectric power plant at the works of the Lockwood Company in Waterville.

WYTOPITLOCK, ME.—The Springer Lumber Company is installing a new steam-driven pump and an electric generator.

BURLINGTON, VT.—The Queen City Cotton Company has awarded the contract for wiring and installing electric fixtures in 67 tenements to the Burlington Light & Power Company.

DANA, MASS.—The Dana Board of Trade is considering a proposal submitted by the Gardner Electric Light Company for lighting the town.

NATICK, MASS.—The Northways Motor Corporation, recently incorporated, has acquired a site of 30 acres in Natick on which it will erect a plant for the manufacture of motor trucks, tractors, special motors and passenger cars. The officers are: James F. Cavanaugh, president; R. R. Northway, vice-president and chief engineer; J. H. Walker, treasurer and general manager of the Walker-Wells Manufacturing Company and Amesbury Body Company, is chairman of executive committee.

WEBSTER, MASS.—The New England Power Company has petitioned the Board of Selectmen for a franchise to cross the highways in five places in Webster.

WELLESLEY, MASS.—Plans are being prepared by French & Hubbard, 88 Pearl Street, Boston, for the construction of an addition, 35 ft. by 45 ft., to the boiler house at Wellesley College.

LONSDALE, R. I.—Plans have been filed by the Lonsdale (R. I.) Company and contract has been awarded to the J. W. Bishop Company, 109 Foster Street, Worcester, Mass., for the construction of a new transformer building at its plant.

NEW LONDON, CONN.—The general contract for the construction of the new power house and machine shop at the submarine base for the United States government has been awarded to the Ewalt Construction Company, 161 Devonshire Street, Boston, Mass.

STAMFORD, CONN.—Contract has been awarded by the Stamford Gas & Electric Company to the Vuono Construction Company of Stamford for the construction of a new brick pump and screen plant and valve house at its works, to cost about \$10,000.

Middle Atlantic States

AUBURN, N. Y.—The Empire Gas & Electric Company has petitioned the Public Service Commission for permission to issue \$171,000 in bonds, the proceeds to be used for extensions and improvements.

BINGHAMTON, N. Y.—The Binghamton Cutlery Works has awarded a contract to the Binghamton Light, Heat & Power Company for furnishing electricity to operate the new plant of the company to be established by the cutlery company. About 150 hp. will be required for the initial operations.

BROOKLYN, N. Y.—Contract has been awarded by the War Department to the Turner Construction Company, 242 Madison Avenue, New York, for the construction of the new terminal on Second Avenue, between Fifty-eighth and Sixty-fifth Streets, South Brooklyn, to cost about \$10,000,000. The buildings will be equipped with cranes, hoisting and conveying machinery, etc.

BUFFALO, N. Y.—The International Railway Company is planning the construction of 8.7 miles of new track in Buffalo this year. The cost is estimated at about \$870,000.

CORNING, N. Y.—The Corning Painted Post Street Railway Company is contemplating the construction of an extension of its car line to North Corning.

CENTRAL ISLIP, N. Y.—Bids will be received by the State Hospital Commission, Capitol, Albany, until June 5 for new boilers and heating work for the new central heating and lighting plant at the Central Islip State Hospital. Drawings and specifications may be consulted at the hospital at Central Islip, at the New York office of the Department of Architecture, Room 1224, Woolworth Building, and at the Department of Architecture, Capitol, Albany. Lewis F. Pilcher is state architect. E. S. Elwood is secretary of state hospital commission.

CORNING, N. Y.—The bill granting the Lamoka Electric Water Power Corporation a charter has been signed by Governor Whitman. The company proposes to construct a large concrete dam across the Lamoka valley above Bradford to impound and store up the overflow from Lake La-

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

moka and Lake Wanita. This water will be carried in a large concrete tunnel to the shores of Lake Keuka, a drop of 390 ft. in 2 miles, there used to generate electrical energy at a plant to be located near Grove Springs. Electricity generated at the plant will be transmitted to Corning, Penn. Yan. Hammondsport, Watkins, Bath and other towns for commercial purposes.

JAMESTOWN, N. Y.—Plans have been prepared by F. A. Shoemaker, Builders' Exchange, Buffalo, for the construction of an addition to the boiler plant of the Art Metal Construction Company at Jones Street and G Avenue.

NEW YORK, N. Y.—The United Machine Works, 55 West Third Street, New York, it is reported, would like to receive prices on oil engines and generators. Alternating-current units, directly connected, from 100 to 500 hp., preferred.

NEW YORK, N. Y.—Bids will be received by W. W. Witherspoon, superintendent of public works, Capitol, Albany, until June 18 for installing electric wiring, lighting, power, battery-charging equipment and auto truck scales for Pier 6 East River, New York City. For details see Searchlight Department.

OLEAN, N. Y.—Bids will be received by Captain John A. Coffey, secretary to the State Board of Armory Commissioners, 158 State Street, Albany, until June 12 for construction, heating, sanitary and drainage and electric work in connection with the reconstruction and addition to the Olean Armory. Plans and specifications may be seen at the above office, at the New York office of the Department of Architecture, Room 1224, Woolworth Building, and at the Department of Architecture, Capitol, Albany. Drawings and specifications may be obtained at the Department of Architecture, Capitol, Albany. Lewis F. Pilcher is State architect.

OTISCO, N. Y.—The Otisco Light & Power Company has petitioned the Public Service Commission for permission to construct and operate an electric-lighting plant in Otisco and also to take over the local electric plant, owned by Earl T. Harter.

SAYVILLE, N. Y.—Contract has been awarded to the E. J. Electric Installation Company, 221 West Thirty-third Street, New York City, by the United States government for the installation of a new electric floodlighting system at the local wireless station.

WATERTOWN, N. Y.—Plans are under consideration by the Northern New York Utilities Company, 137 Arsenal Street, for a new power development on the Black River, to cost about \$300,000. James Brownell of Strickland is engineer.

ELIZABETH, N. J.—The Dusenberry Motors Corporation of Elizabeth is contemplating building an addition to its plant, part of which is to be used as a motor testing department. The cost is estimated at \$90,000.

HARRISON, N. J.—Plans have been filed and contract awarded to Edward M. Waldron, 665 Broad Street, Newark, for the construction of a new building, 50 ft. by 100 ft., at the local plant of the General Electric Company.

JERSEY CITY, N. J.—The lowest bid for electrical work for the proposed new public school buildings Nos. 6 and 23, to cost about \$754,000 and \$780,000 respectively, was submitted to the City Commission by Hoffman & Elias, 549 Colbs Avenue, New York City, at \$11,189 and \$12,179 respectively.

NEWARK, N. J.—An appropriation of \$97,350 to be used for lighting, heating and power purposes for the various institutions throughout the county, covering a period from May 8 to Dec. 31, 1918, has been approved by the Board of Freeholders.

OGDENSBURG, N. J.—The boiler plant at the limestone quarry of the Wharton Steel Company was recently destroyed by fire. The structure will be rebuilt at once.

PHILLIPSBURG, N. J.—The Lapatoong Water Company, it is reported, is contemplating improvements to its system, including the erection of a pumping and power generating station.

POMPTON LAKES, N. J.—Plans have been completed for the construction of a new hydroelectric power plant on Corning Lake. The building will be about 40 ft.

by 65 ft. A bond issue of \$46,000 has recently been authorized by the Borough Council.

PRINCETON, N. J.—Plans are under consideration by the Borough Council for improvements to the electric fire-alarm system.

CHESTER, PA.—Plans have been filed by the Philadelphia Railway Company for the erection of a repair shop, at Penrose Ferry and Fort Millin Roads, consisting of two one-story structures, to cost about \$28,000. One of the buildings, 70 ft. by 78 ft., will be used for woodworking operations.

EASTON, PA.—The William Wharton, Jr., Company, has contracted with the Pennsylvania Utilities Company of Easton for energy to operate its new electric furnace. About 1500 kw. will be required.

ELWOOD CITY, PA.—Notice has been filed with the Public Service Commission by the Pennsylvania Power Company of an issue of \$9,000 in bonds, the proceeds to be used for improvements, etc.

ENOLA, PA.—Preparations are being made by the Pennsylvania Railroad Company to begin work on improvements and alterations in its local power plant and engine house.

PHILADELPHIA, PA.—Plans have been prepared by the Millin Chemical Corporation, Delaware Avenue and Tasker Street, for an addition to its boiler plant.

PHILADELPHIA, PA.—Plans are being considered by the Scott Paper Company, Seventh Street and Glenwood Avenue, for the erection of a fourth unit at its works at the foot of Market Street, Chester, to cost about \$250,000.

PHILADELPHIA, PA.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., to Thomas Reilly, Seventh and Sedgely Streets, for the construction of the proposed power house and two transformer stations at the League Island Navy Yard, to cost about \$129,986.

SHAMOKIN, PA.—The school directors have decided to install an electric plant for lighting the high school, at a cost of about \$2,000.

SHARON, PA.—Work has been resumed by the Shenango Valley Electric Light Company on the installation of the new ornamental lighting system.

BALTIMORE, MD.—Preparations are being made by the City Council to begin work at once on the installation of new electric conduits, wires, etc., in Hollins Street, Hollins Market and Carrollton Avenue.

INDIAN HEAD, MD.—The War Department, Washington, D. C., is contemplating the construction of a plant to manufacture nitrates for naval explosives at Indian Head, for which an appropriation of \$9,150,000 will be made.

FREDERICKSBURG, VA.—Plans are being considered for the installation of a power plant and laundry at the State Normal School.

PEARISBURG, VA.—The Giles Power Company, recently incorporated with a capital stock of \$50,000, proposes to construct an electric plant to cost about \$30,000. The plans provide for the erection of an electric transmission line to connect Pearisburg, Narrows and Glenlyn, a distance of 15 miles. All equipment, it is understood, has been purchased. Bernard Mason is president, and L. C. Hale secretary and manager.

RICHMOND, VA.—Swift & Company, it is reported, are contemplating the construction of an addition to their local cold-storage plant, to cost about \$22,500.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 10, under specification 3028, for furnishing cranes for aero storehouses. For further information address the chief of bureau.

WASHINGTON, D. C.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until June 10 for mechanical equipment, except lighting fixtures, for the United States immigration station at Boston, Mass. Drawings and specifications may be obtained at the above office or from the supervising chief engineer, room 137, Post Office Building, Boston.

WASHINGTON, D. C.—Contracts have been awarded by the War Department for the establishment of two picric acid plants, one to be located at Brunswick, Ga., and the other at Little Rock, Ark., to cost about \$7,000,000 and \$4,000,000 respectively. The contract for the Brunswick plant has been awarded to the Butterworth-Judson Company of New York, N. Y., and the Little Rock plant to the Everly M. Davis Chemical Corporation.

WASHINGTON, D. C.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until June 11 for furnishing and installing lighting fixtures in the United States post offices at Bad Axe, Mich.; Basin, Wyo.; Chapel Hill, N. C.; Farmville, Va.; Forsyth, Ga.; Glasgow, Ky.; Hollidaysburg, Pa.; Kendallville, Ind.; Raton, N. M.; Rogers, Ark.; St. Peter, Minn.; Twin Falls, Idaho; Valparaiso, Ind.; Washington, Ga.; the new post office at Portland, Ore.; the post office and court house at Jasper, Ala.; and Las Cruces, N. M.; and the United States post office and custom house at Beaufort, S. C., and Newport, R. I. For details see Searchlight Department.

North Central States

APPLEGATE, MICH.—The City Council has purchased equipment for a municipal electric-light plant, which will be placed in the building of Garbutt Brothers.

DETROIT, MICH.—The Detroit United Railways Company will soon begin work on the construction of an extension to the Ford submarine chaser plant in Springwells.

DETROIT, MICH.—The water power of the River Rouge, where the great industrial projects, consisting of a large blast furnace, shipbuilding and tractor plant of Henry Ford, are being erected, it is announced, will be utilized to generate electricity.

HASTINGS, MICH.—Plans are being prepared by the Consolidated Press Company for the erection of a foundry and storage building, 130 ft. by 220 ft., a pattern building, 75 ft. by 150 ft., and a small forge shop. Frank Chase, Inc., industrial engineer, Chicago, Ill., has charge of the engineering and construction work.

HOMER, MICH.—The Homer Electric Light & Power Company is contemplating extensions to its plant.

KALAMAZOO, MICH.—The City Utilities Commission is considering remodeling the downtown ornamental lighting system. It is proposed to remove the arms from the lamp standards and place a single high-candle-power lamp on each post.

TEKONSHA, MICH.—The local electric-light plant was recently damaged by fire, causing a loss of about \$5,000.

AKRON, OHIO.—The Northern Ohio Traction & Light Company, it is reported, will soon begin work on the construction of an extension to its Belden Avenue line. The cost of the work is estimated at about \$50,000.

CANTON, OHIO.—The Canton Gas & Electric Company has petitioned the State Utilities Commission for permission to erect a high-tension transmission line along the right of way of the Chicago, Burlington & Quincy Railroad Company.

CINCINNATI, OHIO.—The Superior Electric & Manufacturing Company, manufacturer of electric generators and motors, has removed its plant from 610 Baymiller Street to a building at 118 West Third Street, where its present plant will be increased. Only a small amount of new equipment, it is understood, will be required.

CLEVELAND, OHIO.—Plans are being considered by the Wellman-Seaver-Morgan Company for the erection of a new power house, to cost about \$30,000. The proposed building will be 46 ft. by 97 ft., and will be equipped with steam-heating apparatus, electric-lighting, steam and power equipment.

CROOKSVILLE, OHIO.—The Central Power Company is extending its electric transmission line from Crooksville south to Bearfield Township, where a new plant will supply power for the Jones Coal Company. A branch line is also being erected to the mines of the New York Coal Company at Rose Farm.

NORWOOD, OHIO.—Bids will be received at the office of the auditor of the city of Norwood, corner of Elm and Montgomery Avenues, Norwood, until June 17 for \$15,000 in waterworks and electric light plant extension bonds, to provide funds for extensions and improvements to the waterworks and electric-light plant. W. R. Suhr is auditor.

CONNERSVILLE, IND.—The Rex Manufacturing Company, it is reported, has placed contracts for the installation of an electric plant of about 600 hp.

RICHMOND, IND.—The Board of Public Works has asked the City Council to appropriate \$55,000 for extensions and improvements to the municipal electric-light plant. The proposed improvements will include the construction of a dam and screen and the purchase of a new boiler.

TERRE HAUTE, IND.—The Buettner & Shelburne Machine Company is erecting an

addition, 47 ft. by 197 ft., to its plant, which will be used for the construction of electrical equipment for mining machinery. A number of lathes, drill presses and other machine tools will be required. Arthur Shelburne is general manager.

DEPERE, WIS.—The DePerre Manufacturing Company has revised plans for extensions to its boiler and structural shops, formerly the Lyons Boiler Works, and will increase the size of the addition to the boiler shop from 60 ft. by 100 ft. to 100 ft. square; the addition to the machine shop will be 32 ft. by 200, and the smithy 24 ft. by 40 ft. The foundry will be converted into a structural shop. Ward Clark is general superintendent.

MARSHFIELD, WIS.—The Council is considering a proposal submitted by the Wisconsin Valley Electric Company of Wausau for either leasing or purchasing the local electric-light plant.

MILTON JUNCTION, WIS.—An election will soon be called to submit the proposal to purchase the local electric-light plant to be owned and operated by the municipality. The purchase of the water-works system is also under consideration.

TURTLE LAKE, WIS.—W. L. Alban, architect, Endicott Building, St. Paul, has been engaged by the Board of Education to prepare plans for a new high school building, with manual training and domestic science departments, to cost about \$50,000.

CALEDONIA, MINN.—The right of way for an electric railway between Caledonia and Houston is reported to have been purchased. The officers of the Preston (Minn.) Light & Power Company, it is stated, are interested in the project.

ST. PAUL, MINN.—Plans are being prepared by Lambert Bassindale, architect, Capital Bank Building, St. Paul, for a hospital building and power plant for the Northern Pacific Mutual Beneficial Association in St. Paul, to cost about \$300,000. H. B. Smith, 203 Railroad Building, is president of the association.

DAVENPORT, IOWA.—The Muscatine Lighting Company has been granted a franchise to erect an electric transmission line in Cleona Township to supply energy to the Farmers' Electric Light Company.

NEOLA, IOWA.—Improvements are contemplated to the local municipal electric-light and power plant, involving an expenditure of about \$16,000.

ARCHIE, MO.—The Green Light & Power Company of Pleasant Hill is reported to be considering extending its electric transmission lines to furnish electricity in Archie.

MAYSVILLE, MO.—Improvements to the local electric-light plant, it is reported, are under consideration.

MARMARTH, N. D.—The local electric-light plant was recently destroyed by fire.

POLLOCK, S. D.—The installation of an electric-lighting plant in Pollock is under consideration. The Council is considering a proposal submitted by the Dakota Electric Company, which is planning to install a plant for its own use, to erect a larger plant and furnish electrical service in the town.

Southern States

HENDERSON, N. C.—The Henderson Box & Lumber Company would like to receive prices on the following electric equipment: One 150-hp. engine, one 150-hp. boiler and a 150-kw. generator, directly connected, switchboard and instruments.

CALHOUN, GA.—The Georgia Railway & Power Company has completed a new 66,000-volt substation in Calhoun and has also installed a 2000-kva. synchronous condenser at the Lindale substation.

MACON, GA.—The Chamber of Commerce has appealed to the City Council to have the ornamental lighting system extended from Broadway to the Terminal Station.

METTER, GA.—The City Council has recently purchased another crude-oil engine for the municipal electric-light plant.

CUTLER, FLA.—Contract has been awarded by the War Department, Washington, D. C., to the St. Johns Construction Company of Miami, for the erection of thirty buildings for the aero gunnery school for Signal Corps, including officers' quarters, barracks, mess halls and four steel hangars. The cost is estimated at \$300,000.

FLORIDA CITY, FLA.—The installation of an electric-lighting plant in Florida City is reported to be under consideration by De Berry Brothers.

ST. AUGUSTINE, FLA.—Work will soon begin on the construction of the Flagler Hospital under the supervision of Charles

Leyvrez of St. Augustine. The building will be equipped with electric elevators, silent call system, etc.

SARASOTA, FLA.—The City Council has engaged W. H. Glun, engineer, Sanford, to appraise the local electric plant, make surveys and prepare plans for improvements. The city is considering the construction of an electric plant to supply electricity for municipal and domestic purposes and to operate the waterworks; also to extend the water and sewer systems.

JENIFER, ALA.—Improvements are contemplated by the Central Alabama Coal & Iron Company to its local plant, including the erection of an additional hot blast stove, installation of complete electrical equipment, machine shop, etc.; the construction of additional washer at brown-ore mines adjoining furnace, adding 50 coke ovens to present battery of 100 at coal mine. The plant is operated by the Thomas Furnace Company.

LITTLE ROCK, ARK.—The Mutual Motors Company, Southern Trust Building, is planning to equip a plant for rebuilding motors. Shop equipment, including lathes, drill presses, battery-charging outfit, air compressor, small shop tools, etc., will be required. The cost is estimated at \$50,000.

VILLE PLATTE, LA.—Bids will be received by the city until June 4 for extensions to the municipal electric-lighting plant, including a 35-kw. alternator, building and line extensions, motor-driven pump, switchboard and transformer, moving and repairing one engine and General Electric generator. Specifications are on file at the office of A. C. Jones, Opelousas, La.

Pacific and Mountain States

LOON LAKE, WASH.—Plans have been prepared for the construction of a 100-ton concentration mill at the plant of the Loon Lake Copper Company, to cost about \$40,000. The plans provide for the installation of considerable electrical machinery.

SEATTLE, WASH.—The plant of the Vulcan Manufacturing Company has been purchased by the Frank Waterhouse Company, which proposes to expend several hundred thousand dollars to enlarge the property. Main engine castings, heavy overhead traveling cranes, cargo winches, shaftings, etc., are manufactured in the plant.

CORNING, CAL.—The Northern California Power Company of San Francisco has submitted a proposal to the Board of Trustees for the installation of an electric-lighting system in Corning.

KINGMAN, ARIZ.—Preparations are being made by the Schuykill Mining Company for the installation of a power plant to furnish power for its proposed 200-ton milling plant, now under construction.

PHOENIX, ARIZ.—Plans have been prepared by the Board of Managers of the State Hospital for the Insane for the construction of a power plant at the institution.

YUMA, ARIZ.—Plans are being considered by the Imperial Oil Mills Company for the erection of new electric light and power lines on the highways of Yuma Valley.

Canada

NEW WESTMINSTER, B. C.—Improvements and extensions involving an expenditure of about \$5,000 are contemplated to the municipal electric-light plant.

BARRINGTON, N. S.—The installation of an electric-light plant, to cost about \$8,000, in Barrington, is under consideration.

THEDFORD, ONT.—The Town Council is considering the installation of an electric-light and power system in Thedford.

Miscellaneous

HILO, HAWAII.—Plans are being prepared for the construction of a hydroelectric plant in the Kohala district on the property of Dr. Bond. The proposed plant will cost about \$20,000 and will supply electricity to the new girls' seminary and also to residents and factories in that district.

PANAMA.—Bids will be received at the office of the general purchasing officer, Panama Canal, Washington, D. C., until June 14 for furnishing the following supplies: Motor-generator sets, capstans, radiators, motor-driven pumps, motor trucks, etc. Further information may be obtained at the above office.

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, A. H. Krom, 29 South La Salle St., Chicago.

AMERICAN ELECTRIC RAILWAY ASSOCIATION. Secretary, E. B. Burrill, 8 West Fortieth St., New York. Annual meeting, Atlantic City, Oct. 8 and 9.

AMERICAN ELECTROCHEMICAL SOCIETY. Secretary, Prof. J. W. Richards, Lehigh University, South Bethlehem, Pa.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS, INC. Secretary, F. A. Molitor, 35 Nassau St., New York City.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, F. L. Hutchinson, 33 West 39th St., New York. Board of directors meets monthly. Sections and branches in the principal electrical centers throughout the country.

AMERICAN PHYSICAL SOCIETY. Secretary, Prof. A. D. Cole, Ohio State University, Columbus, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary-treasurer, Edgar Marburg, University of Pennsylvania, Philadelphia.

ARKANSAS ASSOCIATION OF PUBLIC UTILITY OPERATORS. Secretary-treasurer, W. J. Tharp, Little Rock, Ark.

ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES. General secretary, C. E. Dustin, 30 East 42d St., New York.

ASSOCIATION OF EDISON ILLUMINATING COMPANIES. Secretary, George C. Holberton, San Francisco, Cal.

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS. Secretary, John F. Kelly, McKeesport, Pa. Annual convention, September, 1918.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS. Secretary-treasurer, Joseph A. Andreucetti, Chicago & North Western Railway, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS. Secretary, W. L. Connelly, Gibson, Ind.

BRITISH COLUMBIA ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary, R. B. W. Pirie, 406 Yorkshire Building, Vancouver, B. C. Annual meeting, September, 1918.

CALIFORNIA ASSOCIATION OF CONTRACTORS AND DEALERS. Secretary, A. H. Halloran, San Francisco, Cal.

CANADIAN ELECTRICAL ASSOCIATION, affiliated with N. E. L. A. Secretary-treasurer, M. C. Gilman, Toronto Electric Light Company. Annual meeting, Ottawa, Can., June 21.

COLORADO ELECTRIC LIGHT, POWER AND RAILWAY ASSOCIATION. Secretary-treasurer, T. F. Kennedy, 900 15th St., Denver, Col.

COMMERCIAL ASSOCIATION, N. E. L. A. Secretary, F. D. Beardslee, Union Electric Light & Power Co., St. Louis, Mo.

CONNECTICUT ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, George M. Chapman, Waterbury, Conn.

EASTERN NEW YORK SECTION, N. E. L. A. Assistant secretary, J. L. Hemphill, General Electric Co., Schenectady, N. Y.

ELECTRICAL MANUFACTURERS' CLUB. Secretary, Shiras Morris, Hart & Hegeman, Hartford, Conn.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION. General secretary, Franklin Overbagh, 411 South Clinton St., Chicago, Ill. Meeting, Cleveland, November.

ELECTRICAL TRADES ASSOCIATION OF CANADA. Secretary, William R. Stavelly, Royal Insurance Building, Montreal, Can.

ELECTRICAL CREDIT ASSOCIATION OF THE PACIFIC COAST. Secretary, Albert E. Elliott, 502 Flatiron Building, San Francisco.

ELECTRIC POWER CLUB. Secretary, C. H. Roth, 1410 West Adams St., Chicago. Meeting, Hot Springs, Va., May 30, 31, June 1.

ELECTRIC VEHICLE SECTION OF THE N. E. L. A. Secretary, A. Jackson Marshall, 29 West 39th St., New York.

EMPIRE STATE GAS AND ELECTRIC ASSOCIATION. Secretary, Charles H. B. Chapin, 29 West 39th St., New York.

FLORIDA ENGINEERING SOCIETY. Secretary, J. R. Benton, Gainesville, Fla.

GEORGIA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, Dan Carey, Atlanta Builders' Exchange, Atlanta, Ga. Annual meeting, June, 1918, Tybee Island, Ga.

ILLINOIS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, L. B. Van Nuys, Central Electric Co., Peoria, Ill.

ILLINOIS STATE ELECTRIC ASSOCIATION. Secretary, R. H. Abbott, Petersburg, Ill.

ILLUMINATING ENGINEERING SOCIETY. General secretary, Clarence L. Law. Sections in New York, Philadelphia, Pittsburgh, Cleveland, Chicago and Boston.

Directory of Electrical Associations

Printed in the First Issue of Each Month

INDIANA ELECTRIC LIGHT ASSOCIATION. Secretary, Thomas Donahue, Lafayette, Ind.

INDIANA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, George Skillman, Indianapolis, Ind.

INDUSTRIAL ELECTRIC HEATING ASSOCIATION. Secretary, Homer Kunz, Toledo Railways & Light Co., Toledo, Ohio.

INSTITUTE OF RADIO ENGINEERS. Secretary, David Sarnoff, City College of New York.

INTERNATIONAL ASSOCIATION OF MUNICIPAL ELECTRICIANS. Secretary, C. R. George, Houston, Tex. Annual convention, Atlanta, Ga., Sept. 24-27.

OKLAHOMA GAS, ELECTRIC AND STREET RAILWAY ASSOCIATION. Secretary, L. W. Morrow, Norman, Okla.

INTERNATIONAL ELECTROTECHNICAL COMMISSION (international body representing various national electrical engineering societies contributing to its support). General secretary, C. le Maistre, 28 Victoria St., Westminster, London, S. W., England.

IOWA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, M. T. Humphrey, Waterloo, Iowa.

IOWA SECTION, N. E. L. A. Secretary-treasurer, L. E. Caldwell, Iowa City, Iowa.

- 1,264,943. **SYSTEM OF SELECTIVE ELECTRICAL DISTRIBUTION**; Charles F. Kettering and William A. Chryst, Dayton, Ohio. App. filed Nov. 20, 1912. Used with internal-combustion engines.
- 1,264,949. **METHOD OF PRODUCTION OF CYANOGEN COMPOUNDS**; Axel R. Lindblad, Ludyika, Sweden. App. filed June 1, 1916. Improvements.
- 1,264,974. **VULCANIZER**; Joseph H. Reeder, St. Louis, Mo. App. filed Sept. 7, 1917. Electric vulcanizer adapted to receive its heat from low-tension currents.
- 1,264,982. **MEANS AND METHOD FOR METERING ELECTRICITY**; Edmund O. Schweitzer, Chicago, Ill. App. filed Aug. 18, 1915. Inexpensive method and apparatus for accurately metering the consumption of electricity, and more particularly means for affording a satisfactory basis for payment to the central-station company by the consumer for electrical energy furnished to and consumed by him.
- 1,264,992. **MOTOR CONTROL**; Walter C. Strang, Yonkers, N. Y. App. filed Aug. 22, 1913. Automatically operated means for preventing the too sudden reversal of the motor.
- 1,265,000. **ELECTRICAL SYSTEM OF DISTRIBUTION**; William A. Turbayne, Niagara Falls, N. Y. App. filed Feb. 15, 1913. A regulating generator or booster is employed to control the division of load between the main source and the auxiliary source.

Record of Electrical Patents

Notes on United States Patents

- 1,265,017. **PUSH-BUTTON SWITCH**; James M. Wilson, Newark, N. J. App. filed April 1, 1915. For out-door use.
- 1,265,026. **HOOD LOCK**; James W. Alexander, Pittsburgh, Pa. App. filed June 14, 1917. For automobiles.
- 1,265,068. **METHOD AND APPARATUS FOR PRODUCING ALTERNATING CURRENTS**; Reginald A. Fessenden, Brookline, Mass. App. filed Dec. 2, 1914. Production of a wave form adapted for special purposes.
- 1,265,071. **INDICATOR FOR STREET CARS AND THE LIKE**; Charles Flint, Spokane, Wash. App. filed April 26, 1916. Operated by either the motorman or conductor of the car to indicate to the passengers thereof the various stations along the route.
- 1,265,163. **PLUG AND PLUG RECEPTACLE FOR ELECTRIC CONDUCTORS**; Otto Bahls and Theodore Siebert, Jr., New York, N. Y. App. filed Oct. 28, 1916. Reliable in action and thoroughly protected against accidental short circuits during insertion or removal of the plug.
- 1,265,184. **METHOD OF CONTROLLING ELECTRICAL POWER TRANSMISSION**; Herbert B. Ewbank, Jr., Portland, Ore. App. filed May 1, 1916. Improvements.
- 1,265,192. **PRIMING HEATER FOR AUTOMOBILES**; Robert C. Groh and Martin A. Hansen, St. Paul, Minn. App. filed Jan. 4, 1915. Improvements.
- 1,265,197. **ELECTROMECHANICAL TRAFFIC SIGNAL**; Henry W. Hawes, Lynn, Mass. App. filed March 2, 1917. Especially designed for use on automobiles, motor trucks and motor vehicles in general.
- 1,265,204. **METALLIC-FILAMENT LAMP AND PROCESS OF MAKING IT**; Herman J. Jaeger, Weehawken, N. J. App. filed July 27, 1917. Improvements.
- 1,265,213. **ELECTRIC WATER HEATER**; Otto A. Knopp, Oakland, Cal. App. filed June 7, 1916. Thermostatic electric water heater of cheap and rugged construction.
- 1,265,223. **ELECTRIC FUSE**; Israel Marcus, Winthrop, Mass. App. filed Nov. 27, 1916. A simply constructed fuse having a sight opening in one wall of the casing thereof through which it can be determined whether or not the fuse wire therein is broken.
- 1,265,225. **SEMI-AUTOMATIC TELEPHONE SYSTEM**; Talbot G. Martin, Chicago, Ill. App. filed March 3, 1911. Means are provided for automatically indicating to the operator the character of the line calling.
- 1,265,228. **TELEPHONE EXCHANGE TRUNKING SYSTEM**; Edward A. Mellinger, Chicago, Ill. App. filed Oct. 11, 1910. Automatic switches are employed for selecting trunks or other lines.
- 1,265,247. **MAXIMUM DEMAND INSTRUMENT**; George D. Pogue, St. Louis, Mo. App. filed May 12, 1916. For determining the maximum average demand made by a consumer during an interval of prescribed length occurring at any time during a fiscal period.
- 1,265,284. **SEPARATOR FOR STORAGE BATTERIES**; Ira C. Williams and Charles F. Williams, Muncie, Ind. App. filed Feb. 21, 1917. Means for separating the negative and positive plates from each other.
- 1,265,293. **ELECTRIC SERVICE BOX**; Carl H. Bissell and Harold P. Hastings, Syracuse, N. Y. App. filed Jan. 25, 1913. Especially applicable for housing the terminals, switches, fuses, etc., in branch circuits leading from the main circuit into a building or factory.
- 1,265,294. **ELECTRICAL APPLIANCE**; Carl H. Bissell and Elda G. Smith, Syracuse, N. Y. App. filed Aug. 7, 1914. Adapted for storage-battery-charging stations in railroad terminals and coach yards.
- 1,265,342. **ELECTRIC ARC WELDING**; Otis A. Kenyon, New York, N. Y. App. filed March 14, 1918. Improvements.
- 1,265,360. **PROCESS FOR PRODUCING ALKALI METALS OR THE LIKE**; Walter L. Morrison, Canonsburg, Pa. App. filed Aug. 17, 1916. Improvements.
- 1,265,361. **BURGLAR ALARM**; Emil Muringer, New York, N. Y. App. filed May 29, 1916. Improvements.

- 1,265,398. **AUTOMATIC TELEPHONE CENTRAL-STATION APPARATUS**; Alton E. Stevens, Providence, R. I. App. filed April 28, 1917. Designed to allow faulty or broken parts to be easily removed and perfect ones substituted.
- 1,265,428. **ELECTRIC SIGNALING CIRCUIT-CLOSING ALARM**; Ralph S. Clayton, Philadelphia, Pa. App. filed Jan. 28, 1915. Improvements.
- 1,265,433. **ELECTRIC HEATING UNIT**; Ransom W. Davenport, Detroit, Mich. App. filed Jan. 24, 1916. Improvements.
- 1,265,453. **METAL ELECTRODE USED IN ELECTRIC-ARC DEPOSITION OF METALS**; Ernest H. Jones, Canonsburg, London, England. App. filed Sept. 29, 1917. Improvements.
- 1,265,454. **IGNITION SYSTEM**; Charles F. Kettering and William A. Chryst, Dayton, Ohio. App. filed April 3, 1916. Combined with combustion or explosion engines.
- 1,265,455. **ELECTRIC FITTING**; George C. Knauff, Chicago, Ill. App. filed Dec. 9, 1915. Provides an electric fitting in which one of the wire terminals may be easily and cheaply connected to a conducting shell portion, and in which the juncture of the wire with the shell portion may be readily concealed.
- 1,265,472. **COMBINED BURGLAR OR FIRE ALARM**; Carey T. Matthews, Kennebec, N. C. App. filed July 14, 1916. Uses a plurality of signal devices having different signaling characteristics so as to distinguish, for example, between a fire alarm and a burglar alarm.
- 1,265,485. **ELECTRICAL FURNACE**; Hans Nathusius, Friedenshueette, Kreis Beuthen, Germany. App. filed Oct. 5, 1914. Designed for carrying out metallurgical processes for obtaining zinc.
- 1,265,513. **DASHBOARD LAMP SOCKET**; Edward S. Preston, Chicago, Ill. App. filed May 23, 1917. Improvements.
- 1,265,517. **INCANDESCENT LAMP SOCKET**; Jacob Ribaysen, Chicago, Ill. App. filed June 15, 1916. Improvements.
- 1,265,551. **ELECTROLYTIC APPARATUS**; Charles H. Thomson, Maryville, Tenn. App. filed April 7, 1917. For the separation of aluminum and other metals from ores by electrolytic action in a fused bath.
- 1,265,554. **ELECTRIC WATER HEATER**; Salvatore M. Valdes, San Antonio, Tex. App. filed Nov. 28, 1916. A device within a metallic shell or casing which does not come into electrical connection with the live wire of the circuit.
- 1,265,576. **ELECTRIC CUT-OUT**; Gilbert Wright, Schenectady, N. Y. App. filed May 5, 1915. Excessive current flow is brought about by overheating of a fusible member or body in consequence of such flow.
- 1,265,589. **TELEGRAPH SOUNDER**; Arthur W. Beauprie, Atlanta, Ga. App. filed Feb.

1,265,293—Electric Service Box

- 12, 1916. Capable of being operated by alternating current.
- 1,265,594. **DYNAMO-ELECTRIC MACHINE**; Seven R. Bergman, Nahant, Mass. App. filed June 18, 1917. Armature reaction is neutralized and the exciting flux of the machine is produced by a single field winding whose magnetizing axle is displaced approximately 45 electrical degrees from the magnetizing axis of the armature winding.
- 1,265,613. **ART OF ARC WINDING, HEATING AND THE LIKE**; Charles L. Coffin, Parks, Ga. App. filed April 5, 1916. So to utilize the heat of an electric arc to heat the material to be operated upon that an excessive rush of current is avoided, both at the commencement and throughout the heating operation.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER and AMERICAN ELECTRICIAN

Volume 71

New York, Saturday, June 8, 1918

Number 23

Favorable Position of Electric Public Utilities

FOURTEEN months of war finds the electric utilities of the country in a generally favorable position. While there have been slight handicaps in obtaining sufficient fuel and in financing extensions, not to mention maturing obligations, these troubles have been more or less common to all industries and are part of the price to be paid for liberty. Their weight, however, has not been sufficient to crush, and the sacrifice has certainly been worth while. Manifestly, in war times there must be pain and suffering, losses and personal surrender of conveniences and comforts, of income, of family and of friends. This is so apparent and so inevitable that one marvels at the frantic efforts of the unthinking and unpatriotic to stem the tide of national aspirations and impulses which will bear them on whether they will or not to final victory. Efficiency of production and of use must during war be absolutely insisted on. There must be no waste of men or of material, of labor or of product in the industries essential to the winning of the war, and the less essential industries must be converted to more essential industries as speedily as possible.

Ability to meet demands for power in spite of the irregularities of transport and high cost of fuel have served to establish the principle of central-station power production more firmly than ever, and the coal-zoning system will serve to accentuate its economies. Public utilities, owing to lack of equipment, of fuel and of money, have not always been able to take full advantage of all of the opportunities offered for increasing loads; but this is not altogether a misfortune. Viewed in a certain light, the difficulties of raising money have been advantageous and serve as a check to over-expansion. With the great power shortage that exists throughout the country and a fuel situation destined to become worse with time, the temptation to reach out after supposedly lucrative but in reality short-lived business would, with an easy money market, be hard to overcome.

The necessity for higher rates for electric service, especially for industrial work, is being very generally recognized by public service commissions and by the national administration as well. Not all companies will be able to obtain increases, but a rise in the cost of electric service to consumers will continue to be very general throughout the United States. It was only after a year of war that the necessity for higher rates became apparent in Great Britain, and increases were very generally permitted by the various municipalities throughout that kingdom. New equipment will be in-

creasingly difficult to get unless it can be proved that the generating apparatus is absolutely essential to the conduct of the war. The Fuel Administration is already on record as promising 100 per cent fuel to the central stations of the country, but this presupposes that the fuel will be used efficiently and that the electricity generated from it will be employed only for municipal, domestic and essential industrial purposes.

Owing to many circumstances, the financial outlook has caused some operators much concern. Observation and inquiry, however, fail to reveal any tendency on the part of the public or of the authorities to weaken the integrity of public service corporations or cause them undue embarrassment. It was erroneously supposed by many managers that when their maturing obligations became due or when they needed money for extensions it would only be necessary to certify to these facts before the War Finance Corporation, which would thereupon make the necessary advances. That the War Finance Corporation never had any such notion of its obligations has since become apparent to many managers. If the government requires electrical energy or extensions beyond the power of the utility to furnish, the particular branch of the government desiring the work may advance the necessary funds or the War Finance Corporation may in exceptional cases make loans on excellent security. However, many central stations supplying industries engaged in work both necessary and contributory to the prosecution of the war will not be able to obtain financial relief except through their own efforts. No money for unnecessary work can be obtained by any means.

The demands for electricity will undoubtedly become very much greater as the war progresses, and every facility for increasing the supply through interconnection of systems or other means not involving a greater outlay of fuel, equipment or money will have to be employed. The signs for favorable water-power legislation which will permit hydroelectric development were never so bright, and the disposition of the government is to frown on any further extension of isolated plants and to encourage the use of central-station service everywhere. The government itself is practicing what it preaches and is using public utility service wherever possible, even suggesting an increase in the size of central stations for that purpose. The prospect was never better, and the end of the war should find central stations more efficient as producers and distributors of electricity and more firmly established than ever.

Electric Utilities in the War Program

Taxing Their Facilities to the Utmost, Proving that They Are Highly Essential in War as in Peace, These Properties Have Received Recognition from President Wilson

THE electric public utility is one of the greatest factors in the mobilization of industries for war. Important as it was before the war in the home and industrial life of the nation, it is manyfold more impressive to-day as the source of dependable power for vital industries engaged in making munitions and other strict necessities of life.

Handicaps—and they have been severe in the last year—have not prevented the electric central stations of the country from rendering that uninterrupted service which is one of the main secrets of their usefulness in the economic life of the community.

Meeting demands which tax their facilities to the last kilowatt-hour of possible production in many cities, the managing officials and employees are straining every resource to avoid breakdowns and maintain the supply of energy unimpaired.

Within the industry the significance of the fact that the output has doubled since the beginning of the European war four years ago is generally appreciated, though there is naturally some wonder that the development has been so tremendous, but without the industry it is doubtful if the facts are understood or even known as generally as they should be.

A stabilized business like that of the central stations, involving enormous investment in proportion to the gross turnover, shows under normal conditions a gradual moderate rate of increase from year to year. As a rule this calls for additional investment in fair proportion to the additional business.

TESTED BY THE WAR

The grim fact of war destroys all precedents, and the electric central station, like all other industries, has been swept into the arena and tested by the rough economic forces which now control the world. It has developed greater production than ever before. It has proved beyond any question that it is in every sense essential to the life, health and comfort of the civilian population and to the successful production of munitions for the military forces. By close, intensive development it has made the utmost use of its generating and line capacity.

It is doubtful if before the war any one having responsible authority took the trouble to appraise the central stations of the country with respect to their value in military defense. Certainly, if military motives had controlled the nation, if industrial efficiency had been regarded as a first requirement, the development of central stations would not have proceeded on very different lines from those actually followed. In other words, the plain truth is that these properties, developed wholly upon ordinary commercial lines, were, because of the high degree of efficiency which they attained, in a position where they were immediately of value in the entire plan of military construction and mobilization.

That this is so may fairly be taken as a tribute to the engineering and managerial bases on which these

properties have been built. The American system of large volume output, concentrated production with great generating units, is admitted to be the best one. If it had required justification, which it did not, that justification would have been furnished by the readiness with which the industry met the stern demands of war time.

THE TRADITIONAL UNFAILING SUPPLY

The country is full of instances of service rendered to industries which are producing on an unprecedented scale because of the unfailing supply of electrical energy twenty-four hours a day. This quality of service could not have been rendered if it had not been for the traditional policy. The central stations have not only met the normal increase in demand in their communities, they have anticipated it, and therefore they had a margin in reserve when that margin may have been a powerful element in the successful conduct of the war against unscrupulous Germany.

Central stations are commercial organizations, engaged in business for a profit, and therefore their war work is part of their regular operations. But, lacking the same measure of control over their operations which is held by ordinary commercial institutions, they are feeling in keener degree as time passes the effect of the extraordinary influences resulting from the war. It is for this reason that they have been taking steps to lay the facts before the public and the constituted authorities.

Many properties must have relief in some way if they are to continue to earn a fair return on the investment. Costs are uncontrollable, and the obligation to render service is unavoidable. The regular merchant or manufacturer thinks little of raising prices under similar circumstances. What can the utility do?

HIGHER RATES NEEDED

Part of the extra cost of the utility has been absorbed through new economies, greater use of the property, etc. But when the margin of safety becomes smaller month by month and deficit looms in the background the central-station manager is impelled to take radical steps. So far has the principle of regulation been adopted that usually rates can be advanced only by approval of the state public service commission or when no complaint or investigation against such action develops before that body.

Under the present situation the serious needs of the utilities are receiving more consideration than ever before from those not directly responsible to owners of the properties. In many cases commissions have granted relief through higher rates or have refrained from proceeding against advances in schedules because they knew the critical character of the emergency.

The case of the utilities has received recognition in another quarter. When the President of the United States turned from his overwhelming burden of war

*Woodrow Wilson,
Liberty War President of the United States*

"It is essential that these utilities should be maintained at their maximum efficiency and that everything reasonably possible should be done with that end in view. I hope that state and local authorities, where they have not already done so, will, when the facts are properly laid before them, respond promptly to the necessities of the situation."

W. G. McAdoo,
Secretary of the Treasury

"It is obvious that every part of our industrial and economic life should be maintained at its maximum strength in order that each may contribute in the fullest measure to the vigorous prosecution of the war. Our local public utilities must not be permitted to become weakened."

responsibility to speak on their behalf, it was an act of conspicuous justice and courage. With Secretary McAdoo and Comptroller of the Currency Williams, President Wilson clearly appreciates the paramount importance of the utilities in the war program and the unescapable conclusion that they must be kept efficient.

NATIONAL COMMITTEE REPORT ON CONDITIONS

Coal Supply Situation in East Far from Satisfactory,
New England Anxious, Middle West
in Better Shape

A report of the National Committee on Gas and Electric Service, covering recent activities, says in part:

The Fuel Administration has found it necessary to modify the zoning system of bituminous coal distribution and will no doubt make other changes from time to time as conditions arise making these necessary. Among the consumers of the classifications named in preference list No. 1 of the Priority Board who are to receive coal in preference to any other individual or class of consumers, public utilities as a whole are listed.

Every effort is being made by the Fuel Administration to increase production and to secure for all public utilities sufficient coal to permit them to have a reserve for the winter. The situation in the East is far from satisfactory. New England is very anxious regarding future conditions and supply. The Middle West seems to be in much better shape, as we are advised that it is securing reserve stocks. This should go a long way toward carrying it through the winter if it can continue for the next few months to receive coal in the quantities shipped recently.

It is desired to urge all members to make every effort to secure as much storage coal as possible and as soon as pos-

sible. This is most important for the future success of their plants. Favorable reports issued from time to time should not lessen the activities of our member companies in securing coal for next winter. Nothing as yet has been decided regarding the cancellation of coal contracts made previous to Aug. 23, 1917.

In furtherance of the determination of the Fuel Administration to prevent the marketing of unclean coal, inspectors have been appointed to designated districts.

The committee has been very active during the last month with the Quartermaster and Ordnance departments in connection with furnishing details as to available power and in making contracts for the additional power required by these several departments.

The War Department in making contracts for electric service with the various electric light and power companies has found that conditions vary in different communities, and in order to avoid complications it contemplates having prepared a form of contract which will be satisfactory to both the public utilities and the War Department and which, it is hoped, will be in accordance with the regulations of the various public service commissions. The public utilities have presented for signature their forms of contract, authorized and regulated in accordance with the view of the public service commissions, and these have varied in numerous instances, as stated; hence the decision of the War Department to issue a uniform contract.

The matter of turbine deliveries to public utilities is becoming more acute all the time, and the War Industries Board finds it necessary practically to assign dates of delivery for the manufacturers in accordance with the importance of the needs of the utilities. While this is not intended as a commandeering process, it has been found necessary in order that the needs of the government for the various plants in construction throughout the country shall be taken care of as to power equipment.

The Interstate Commerce Commission has entered an order setting dates for hearings before Commissioner Aitchison in its investigation preparatory to revising time in accordance with the daylight saving law.

John Skelton Williams,
Comptroller of the Currency

"The continued and increasing efficiency of these corporations is important for the successful conduct of the war. This efficiency is not possible with present conditions."

Electricity Restricted in England

Practically All Central Stations in Areas Where Work of National Importance Is Being Done Are Controlled by the Government as to Extensions, Purchases and Service Connections

IN ORDER that central-station managers in this country may have some concise information on central-station conditions and restrictions in England, the ELECTRICAL WORLD, through its London office, has gathered some pertinent facts on the situation there.

There have been a number of regulations since the commencement of the war which have either directly or indirectly restricted the output of electricity. The first of these restrictions, under the defense of the realm act, was due to the Zeppelin raids. Under this act all external lamps, whether public or private, are extinguished excepting such as are required for the public safety and approved by the Commissioner of Police. Those lamps not extinguished must have all direct light cut off, the only light allowed to escape from the lamp being a diffused light on the ground. Lamps in dwellings, factories and other premises must be reduced in brilliancy and shaded by means of dark curtains so that no more than a dull subdued light is visible outside the building. Only sufficient light is permitted on the tramways to enable fares to be collected.

A slight relaxation in the lighting restrictions took place in 1917, but in the beginning of 1918 a further order was issued prohibiting show-window lighting entirely. This was due to the shortage of generating plant in the power stations and the need for economy in coal. The order also enacted that places of entertainment should not use electricity before 1.30 p. m. and should cease using electricity at 10.30 p. m. Hotels, restaurants and other similar establishments are prohibited from cooking meals between 9 p. m. and 5.30 a. m.

INCREASES IN RATES

Owing to large increases in the price of coal and other material, as well as to the increased wages paid to employees (the increases in the case of coal and wages being authorized or imposed by the government), the price of electricity throughout the realm has been substantially increased. This, of course, has caused consumers to economize further in the use of electric light.

The solicitation of new business has been practically abandoned because it is necessary to obtain permits for consumers' motors or wiring material and for new plant and mains for the generating stations. At present no permits can be obtained except for supply to munition factories or other works of national importance and no services costing over \$50 may be fitted without the approval of the government. It should be mentioned in this connection that underground distribution prevails for the most part throughout Great Britain.

Even before these restrictions came into force the extension of generating stations and of service connections was greatly hindered because of the extreme difficulty of getting goods from the manufacturers and the great shortage of labor.

The latest order, which restricts the consumption of electricity south of a line drawn from the Wash to the Bristol Channel, was promulgated on April 2, 1918.

Its issue became imperative in the national interest owing to the reduced output of coal arising from the shortage in means of transport and the withdrawal of large numbers of men from the mines.

The order provides that the consumption of electricity by any consumer for any purpose whatsoever must not be more than five-sixths of the amount used on the same premises during the corresponding quarter of the years 1916 and 1917, whichever was the greater. "Premises" means any place in which electricity is consumed, and any portion of the premises supplied by a separate connection is deemed to be a separate premise.

In no case is the consumer compelled to reduce his consumption below the quarterly amounts set out in the "schedule to the order," reproduced here, but if this did not exceed the amount in the schedule his consumption must not exceed his previous consumption in the same quarter of 1916 and 1917.

SCHEDULE TO THE ORDER

Quarter of the Year	Kilowatt-hours
March 25 to June 24.....	20
June 24 to Sept. 29.....	20
Sept. 29 to Dec. 25.....	40
Dec. 25 to March 25.....	40

Consumers who made any material alterations in their installations between March 25, 1917, and March 25, 1918, may apply to the utility company for an assessment.

If the consumer did not occupy the premises during the whole of 1917, the utility company will, on application, state what amount may be consumed during any quarter for which comparative figures are not available to the consumer. If dissatisfied with the company's assessment, the consumer may appeal to the Board of Trade.

The Board of Trade may grant licenses on special grounds exempting persons or premises from the provisions of the order, which does not apply to establishments controlled under the munitions of war act, 1915, or to hospitals or premises which are and were on March 21, 1918, bona fide nursing homes.

Additional restrictions applicable to hotels, restaurants, clubs and places of entertainment, also prohibiting the lighting of shop fronts, are set forth in the order.

Infringements of the order are summary offences against the defence of the realm act.

Each utility company is compelled to report to the Board of Trade any person whose consumption appears to exceed that permitted by the order. The indications are that the maximum amount of electricity that may be consumed for domestic and shop purposes will be definitely fixed shortly.

The restrictions on purchase of materials began to be felt early in 1916, when the Minister of Munitions by virtue of the powers conferred upon him under the

defense of the realm act issued certain orders restricting the purchase and use of certain classes of materials, chief among which were steel and copper.

UTILITIES ARE ESSENTIAL INDUSTRIES

Central stations were authorized to place ordinary orders other than for steel and copper under rules establishing this order of priority: (a) Repairs to existing industrial machinery but not the replacement of old machinery by new; (b) the maintenance of reasonable stocks of materials for approved contracts; (c) export orders properly certified; (d) contracts necessary for the conduct of the war; (e) other contracts certified as important in the national interest. In the case of large orders for generating equipment application is to be made to the Ministry of Munitions for a special permit. Special permits must also be obtained for the purchase of steel and copper.

The supply of electricity by most of the London companies has been certified by the Ministry of Munitions under Clause 9 (1) (d) of the munitions of war (amendment) act, 1916, to be essential to the conduct of the war. These utilities are subject to the regulations of the ministry as regards recruitment of employees and execution of orders, but are in a stronger position than those industries which are uncertified, which as regards protection of employees from military service must rely on appeals to tribunals.

The indispensable employees of the "certified" undertakings are protected under a schedule of protected occupations issued by the Admiralty, War Office and Ministry of Munitions.

Central stations desiring turbo-generators, motors, boilers, switch gear, etc., must obtain a permit from the ministry before the material can be purchased. There is a severe restriction on the manufacture of watt-hour meters, and a special permit for the purchase of new meters is necessary.

There are five existing grades of priority in force at present, namely, P.1, P.2, P.3, P.4, P.5. Generally, new plant equipment is bought under P.4 certificates, and for stores and other similar materials nothing higher than a P.5 certificate is issued.

Central stations in large metropolitan districts like London have special authority from the ministry for the issue of priority certificates for material and work necessary for maintaining their stations. These certificates are as follows:

(a) Class A P. 4, authorizing the purchase of materials and work necessary for any urgent repair necessitated by an occurrence in the nature of a breakdown to maintain existing running machinery and plant. A copy of the order has to be sent to the ministry, and if the classification for the work is queried notification will be given by the ministry to this effect within seven days.

(b) Class B P. 5, for repairs and materials for repairs to maintain in working order the existing plant and customers' installations. No new units of machinery, however small, even in the nature of replacement, to be ordered under this permit. This permit does not cover requirements for new meters, cable required for use outside the power station, lead or articles composed wholly or partly of lead. A report of all material purchased under this ministry permit must be sent in monthly.

Severe restrictions are enforced on the use of lead-sheathed cables, and a special ministry permit, which is only issued for war work or work of real national importance, is necessary in each case for their purchase. Generally speaking, the ministry eventually

grants permission for the purchase of lead-sheathed cables for extra high-voltage working and also, in many cases, for high-voltage working, although almost invariably the ministry first requests the use of cables without lead covering. Permission to purchase lead-covered cable for low-voltage working is granted in very exceptional cases only.

SERVICE CONNECTIONS

The Ministry of Munitions raises no objection to additional connections being made, subject to the utility's compliance with the following conditions:

(1) That it has adequate generating plant capacity available.

(2) That no lead-covered cable is used on the connection.

(3) That the cost of connection (including any mains extensions) to be borne either by the utility or by the consumer does not exceed £10 (\$50).

(4) That the utility forward to the director of electric power supply at the end of each month a list of consumers connected during the month, giving name, address, purpose (*e.g.*, private house, ironmonger's shop or paint manufacturer), kilowatts installed and cost of connection.

Where additional power is required the utility is requested by the ministry to give this information:

(1) Whether it is willing to undertake the work.

(2) The amount of power to be taken.

(3) The present load on the power station.

(4) Length and size of cable, quantity and specification of other articles and materials required for the job, and whether the same are in stock.

(5) Margin of available plant in power station.

COAL SITUATION

Practically all extensions of supply have been limited to those required for war work. The demands, however, have been so great that the majority of public supply undertakings have largely increased their output.

A consideration of great importance has been that of fuel economy, and power users generally have been much more disposed to use the public supply than to generate their own power on account of increased difficulties in obtaining coal.

The coal transport problem has led to restrictions being imposed in the south of England, but up to the present no restriction on coal consumption has been applied in the north, where the coal fields are situated. It appears, however, that restrictions may become necessary on account of the large reduction in the number of men working in the coal mines, and in such case no doubt consideration will be paid to the fuel consumption of the various plants, and, other needs being equal, the most inefficient will be shut down.

Other restrictions foreshadowed include a considerable reduction in tramway and electric railway services, including the underground services of London, and the rationing of London in coal next winter on a much lower scale than in the past. It is proposed to extend rationing to the greater part of England.

The power companies which supply wide industrial areas have taken a very large part in meeting the war demands. Munition factories have been erected in all parts of the country, and existing works have been converted, with the aid of the public supply, from their normal trade to war work with a minimum of delay.

War Expansion of Washington's Utilities

Needs of Government in New Public Buildings and at Camps and Cantonments Are Being Met Before Wants of Private Consumers, and Even Steam Heat Is Furnished as a War Necessity

THE Potomac Electric Power Company is doing its full share to aid in winning the war and, in line with this endeavor, has been obliged greatly to expand its equipment and facilities to meet needs brought about by the erection of many additional government buildings in Washington and the establishment in and around the capital of many camps and cantonments. The company, of which J. C. McLaughlin is general manager, now has nineteen substations, of which two were erected in the past year. Many of the others have been increased in size, and the company is now building still another, which will make twenty in all. The electricity generated is used as far as Bluemont, in the mountains of Virginia, and as far as the heart of Baltimore.

ENLARGEMENT OF STATION

As was made necessary by the general increase in business and by anticipation of a still further increase, the company installed a new 15,000-kw. unit in January, 1917, at the main plant, Benning, D. C., and then placed an order for an additional 15,000-kw. unit, which is promised for delivery July 5, 1918. To take care of this additional equipment it has been necessary to extend the turbine room, to build a new boiler room, and to place an order for delivery July 1, 1918, for four Babcock & Wilcox boilers of 1000 hp. each. The company is also erecting two new reinforced-concrete stacks, 205 ft. (62.48 m.) high and 12 ft. 6 in. (3.8 m.) in diameter, each one large enough for four 1000-hp. boilers. Anticipating still further demands, the company is now negotiating for a complete duplication of these boilers and another 15,000-kw. set.

Some of the nineteen substations in use serve the Washington Railway & Electric Company, of which system the Potomac Electric Power Company is a corporate part, but most of the war expansion of the power com-

pany has been for the purpose of serving government needs for heat, light and power in new government buildings in Washington. It is interesting to note that some of this service is steam heat. As a consequence of the necessity for serving the government first, the power company has been obliged to delay serving private customers; but there is very little if any complaint on this score in Washington, as the power company has always been on the best of terms with the Washington public, enjoying an enviable reputation among public service companies, and, in addition, the Washington public is well trained to the idea that the government must come first in these war times.

Most of the company's expansion has been accomplished without meeting many obstacles, except in the matter of finance, a difficulty common to most public utility corporations recently. The officials of the power company have had the advantage of working closely with government officials, however, on expansion needs, and are now endeavoring to be of assistance in solving some of the problems which are coming up in connection with the housing of war workers in Washington. The company is preparing to furnish steam heat for this housing, when the sites are finally decided upon, and if these sites shall be in the neighborhood of Fourteenth and B Streets, as is expected, it is said to be practically decided that the company will furnish steam heat from its plant in that neighborhood. This will be done at a great saving for the government, for the steam heat will be furnished at a cost much less than would be involved if the government were obliged to put up heating plants and produce heat.

SUPPLYING NEW GOVERNMENT BUILDINGS

When the new government buildings in the section of the city which lies southwest of the White House were erected it was necessary for the power company to

purchase ground in that neighborhood and erect a building, at Eighteenth and D Streets, known as Substation No. 19. This station is rated at 2000 kw. and serves the buildings of the Council of National Defense, the United States Fuel Administration, the United States Food Administration, the War Trade Board and one of the great ordnance buildings. The company also installed a 500-kw. rotary in the substation owned by the government at Sixth and B Streets, N. W., where there are additional ordnance buildings, the construction department of the army, etc. In addition to the 500 kw. in this government substation, the government is to install two additional units of 500 kw. each at its own expense, and the company is to operate the substation and furnish the energy.

For the new Army and Navy Building at Nineteenth and B Streets, which in point of ground space will be the largest office building in the world, the government is erecting a substation and will install two 750-kw. units to be operated by the government, the energy to be furnished by the power company. All these units will probably be tied in with the company's through-wire Edison system.

For the company's Substation No. 10, on I Street between Fourteenth and Fifteenth Streets N. W., the company has ordered one 1350-kw., 250-volt rotary; for the company's Substation No. 13, on Sherman Avenue N. W., the company has ordered one 1250-kw. frequency-changing set; for the company's Substation No. 12, at Thirty-third and K Streets N. W., the company has ordered one 750-kw., 2400-volt frequency-changing set, and the company has installed in its substation at Fourteenth and B Streets N. W., known as No. 16, one 1000-kw., 250-volt generator set. Last December, owing to the increased demand for energy, it was necessary for the company to start up its old reciprocating plant at Fourteenth and B Streets N. W. This has a rating of 3500 kw., made up of 250-volt generators, and from it 1800 kw. is furnished to the railway company.

The Bureau of Engraving and Printing, the work of which, notably in the printing of the Liberty bonds, has greatly increased as a result of the war, has ordered and is installing a 500-kw. rotary converter to help take care of increased energy furnished by the power company. The new Navy Department annex building, now being erected on the site of the old Arlington Hotel, at Vermont and I Streets N. W., will be supplied by the company's Substation No. 10, rated at 1350 kw. The new Treasury Department annex, now being erected at the corner of Pennsylvania Avenue and Madison Place, next door to the Belasco Theater, in which the War Risk Insurance Bureau is to be housed and which will be connected with the main Treasury building by a tunnel under Pennsylvania Avenue, will also probably be supplied from the company's Substation No. 10. At the Bureau of Standards there is an increased load due to war demands, and it has been necessary for the power company to order a 350-kw. rotary converter to care for this.

When the daylight saving act went into effect the company's peak load dropped about 7000 kw. It is expected that the company will get that back again when time changes back to the old basis—Nov. 1. The company is obtaining equipment in anticipation of this increased load. Its estimated expense for improvements and additions contracted for last year and being in-

stalled now amounts to \$1,250,000. With the new 15,000-kw. equipment this item will run \$300,000 more. In addition, the underground conduit expense alone will amount to an additional \$100,000. The company's station output has increased 20 per cent. A new source of revenue is found in the fact that the company has contracted to furnish to the government from its plant at Fourteenth and B Streets N. W. steam heating to the extent of 3000 to 4000 boiler-hp. It is intended to heat the new Army and Navy Building, at Nineteenth and B Streets N. W., with steam, as well as the government office buildings being built on Four and One-half and Sixth Streets.

SERVING OUTLYING POINTS

The company is supplying service to many out-of-the-way places, as well as to Fort Myer, Va., where the officers' training camps and other training camps are located; to American University Park camp, where engineers are being trained; to the Washington Steel & Ordnance Company, opposite Alexandria, Va., on the Potomac River, where shells and other munitions are made; to the Washington Navy Yard, where naval guns are made; to the sea-plane hangars on the Eastern Branch of the Potomac River; to the Washington Barracks, where engineers are trained, and to the Army War College, on the Potomac River; to the high-powered radio station at Arlington, Va.; to the Camp Meade cantonment, between Baltimore and Washington; from the Bennington station through the Washington, Baltimore & Annapolis Electric Railway to Annapolis; to Mount Vernon and Alexandria through the Washington & Virginia Railway, and to Bluemont, Va., in the mountains, through the Washington & Old Dominion Railway. Some of these points are 100 miles (160.9 km.) apart.

Government Still Calls for Technical Men

An urgent call for high-grade technical men and operatives to fill war positions in industrial establishments is made through the Civil Service by the United States Army Ordnance. Salaries ranging from \$1,600 to \$6,000 a year will be paid the men who qualify. Chemists and chemical engineers, men experienced in the manufacture of gas—mechanical engineers on high-pressure apparatus—engineers to take charge of power houses and foremen of machine shops are needed. Persons of military age accepting appointment will not avoid the obligations of the selective service law.

The Army Ordnance in issuing its call for these men is insisting on one point. No applications will be accepted from government employees or employees of firms or corporations engaged in contracts for the government or its allies unless written assent to such application is given by the head of the establishment that might be seriously handicapped in its war work by the loss of the man.

Power-house engineers will be paid \$1,800 to \$2,400 a year while working for the Ordnance Department. Supervision of operation of water-tube boilers, condensers, pumps, steam turbines and alternating-current and direct-current generators and motors are among the duties of these men. Machine-shop foremen with salaries from \$1,800 to \$2,400 also are wanted by the Army Ordnance. Ten years' experience as machinists—three years in a responsible supervisory capacity—is required.

War Conservation of Power and Light

Interconnection of Generating Systems, Elimination of Duplicate and of Uneconomical Plants, Maximum Use of Water Power and Careful Watch of Machinery in Factories Planned by Fuel Administration

BY CHARLES E. STUART

Chief of Power and Light Division, United States Fuel Administration

GENERAL plans have been laid for the conservation of light and power by the Bureau of Conservation of the United States Fuel Administration, of which P. B. Noyes is director, and these plans will be carried out by the power and light division. They will be developed under the following subdivisions:

1. Elimination of uneconomical isolated plants.
2. The application of the "skip stop" to railways and the regulation of car heating and lighting.
3. Economy in utilization of power and light in factories.
4. Utilization of excess water power and interconnection of power systems.
5. Limiting the production of power to the most efficient plants available.
6. Economy in the refrigerating and ice-manufacturing industry.

A brief statement with respect to each of these subdivisions follows.

The plans will be carried out through the co-operation of the following:

First—A force of engineers organized and stationed with the Fuel Administration at Washington.

Second—The engineering department of the United States Geological Survey.

Third—The power division of the Council of National Defense.

Fourth—A state fuel engineer attached to the office of the state fuel administrator, to supervise the activities in his state.

Fifth—The Public Service Commissions and state regulatory bodies.

Sixth—The chambers of commerce and similar representative business bodies.

Seventh—Volunteer engineers throughout the country.

The following gives the scope of the subdivisions:

ELIMINATION OF UNECONOMICAL ISOLATED PLANTS

The individualistic way in which fuel is now consumed in cities is not efficient. A ton of coal burned in a large central station will produce at least four times as much electric power as if burned in the average small plant, and if centralized burning could be introduced to a greater extent the amount of fuel required could be reduced without reducing in any way the ultimate production of light and power.

It is sometimes the case that in buildings where there are electric plants and where exhaust steam is utilized in the heating of the building and in furnishing hot-water requirements central station service can be adopted without a loss of money and at a saving in fuel.

As a rule it may be stated that where no extensive heating system is operated in conjunction with the generating plant such a plant can purchase power at a great fuel saving and with a possible reduction in power

cost. In other cases it would be more economical, from the viewpoint of fuel saving, to utilize central-station service in conjunction with isolated electric plants.

It is the duty of the Fuel Administration to devise means for securing a curtailment in the use of fuel in ways which will impose a minimum of hardship. It is believed that there are many plants not only in New York but throughout the entire country which could, at least temporarily, shut down their own electrical machinery and purchase power from others at a financial advantage to both and with a considerable saving in fuel.

The Fuel Administration believes that if even a comparatively small proportion of the plants throughout the country which could save fuel in this way at a profit to themselves would do so, it would prove a tremendous help in meeting the fuel situation with which the country is confronted and in winning the war.

While it may appear that the interests of the central station are being benefited to a large degree, such is not of necessity the case. In some cases central stations may be shut down. In any event any connection between a central station and a building or a manufacturing plant that is affected will of necessity be for the period of the war only or through the period where the coal situation is critical. The machinery of the isolated plant can be readily preserved through this period of necessity. Under these circumstances the heavy expense attendant upon the making of the connection by the central station may completely offset, or even more than offset, any profit which could be expected of such a load through a short period.

APPLICATION OF "SKIP STOP" TO RAILWAYS AND REGULATION OF CAR HEATING AND LIGHTING

One of the most promising methods by which we are securing economy in the use of fuel throughout the country is by the introduction of the "skip stop" system on the electric railways of the various cities.

With the present practice of having cars stop on signal at any street corner, there are usually from twelve to fourteen stopping points per mile. With the "skip stop" system, properly applied, these are reduced to not more than eight per mile in the business districts, six per mile in residence districts and four per mile in the open country. With the number of stopping points decreased in this way, a saving of from 10 to 15 per cent can ordinarily be effected in the power and hence in the fuel required, while at the same time the average speed of the cars is increased, without any increase in the maximum speed, and the service thus improved. Since this measure secures economy in fuel not only without handicapping the service, but with an actual improvement, it is obviously an extremely desirable type of conservation measure.

Our plan is to secure the adoption of the system by

voluntary co-operation between the railway companies and the various municipal authorities or state commissions and to bring about this co-operation through the federal fuel administrators for the several states. These administrators are all men of influence in their communities, and so far we have found in every case that a request from the state administrator to the proper authorities was all that was necessary to secure permission for the introduction of the system as a conservation measure during the war. With permission thus provided for, the railway companies have all been glad to adopt the plan.

Through our efforts, through the independent efforts of various local administrators or through the efforts of certain railway companies themselves, the "skip stop" system has been adopted, or is about to be adopted, as a coal conservation measure in Detroit, Washington, Baltimore, Brooklyn, Cincinnati, Columbus, Dayton, Toledo, Indianapolis, Evanston and South Bend, Ind.; Newark and the other cities of New Jersey, New Haven and all the other cities of Connecticut, and in Oakland, Berkeley and Alameda, Cal.

The Connecticut Company has reported a saving in fuel of 10 per cent for its New Haven lines, and reports indicate saving in the other places at rates varying from 3600 tons per year in Columbus to 21,000 tons per year in Detroit.

Various schemes for reducing car heating have been contemplated, but as yet no definite plans have been formulated.

ECONOMY IN UTILIZATION OF POWER AND LIGHT IN FACTORIES

The United States Fuel Administration is requesting, as a means of accomplishing power and light conservation in manufacturing and industrial establishments, the appointment by the management of a shop committee, composed of those best suited for the purpose and in size or number suitable to the size of the plant, one member of this committee to act as its chairman. The committee is to be active with and have charge of all details in the operation of the plant that would in any way contribute to economy in fuel or the things which fuel is used to produce and to report weekly to the management or head of the plant. It is also suggested that this committee be changed from time to time, so that the spirit and interest in this work may be maintained.

It is not the purpose arbitrarily to outline in detail the method for doing this work, but rather to suggest in a general way, leaving the details and adaptation of the plan in the hands of the manufacturers interested, as we realize that conditions in different plants and character of manufacture as well as organization will have a bearing on the size, character and details of the committee, which must be suited to the particular case under consideration.

As typical illustrations of possible waste and opportunity for conservation, we mention the following:

1. Lights being unnecessarily burned.
2. Lamps of too high candlepower.
3. The elimination of carbon lamps in favor of tungsten lamps where practicable.
4. The elimination of arc lamps and substitution of nitrogen-filled lamps, which are from two to three times as efficient.

5. The restricted use of sunlight owing to dirty windows.

6. Operation of motors when machinery is idle.

7. Excessive sparking, heating or erratic speed of motors.

8. Improper alignment of shafting.

9. Grouping of machines so as to operate motors or engines as nearly loaded as possible.

10. Staggering of operations so as to maintain as flat a load curve as possible.

11. Slipping belts.

12. Dry bearings.

13. Overheated or underheated parts of plant.

14. Excessive drafts due to lack of proper protection about openings of doors, windows, elevator and staircase areas.

15. The reduction of elevator service or the application of a "skip stop" to it.

16. The testing of power circuits for relationship of capacity to load carried.

17. The paralleling of power circuits.

We also suggest that the work of this committee be conducted in such a manner as to provide records of savings, which could be incorporated in reports and information desired from time to time as to the progress of this work.

The War Industries Board and the United States Fuel Administration are laying particular stress on the assistance that can be rendered by industries in economizing in the use of fuel and power. For the purpose of recognition of the individual service and interest of the members of committees, the government will designate and identify them with a button or badge which will be furnished by the United States Fuel Administration.

The endeavor to bring about conservation by the above means is well under way in several sections of the country. Reports which have come in show savings in fuel ranging from 10 to 34 per cent.

UTILIZATION OF EXCESS WATER POWER AND INTERCONNECTION OF POWER SYSTEMS

A method of fuel conservation which promises a certain amount of immediate relief and at the same time opens up a field with almost limitless possibilities for future development is the interconnection of the present power systems of the country and the consequent utilization of considerable excess water power which is at present available.

In many parts of the country duplicate transmission systems exist, serving practically the same territory. An interconnection between these systems for the mutual exchange of energy would in many cases result in marked economies. In other cases the lines of a power company which derives all or nearly all its energy from water power may extend very close to the lines of another company which uses coal to a large extent for the generating of power. Since no company is so fortunate as to be operating with a 100 per cent load factor, there are necessarily times during light load when the water-power company is forced to allow unproductive water to flow over its dam. At such a time a great saving in fuel would be effected were the two companies tied together and the load on the steam station transferred in part or entirely to the water-power plant. Numerous hydroelectric companies have for a long time

been carrying out this idea within their own systems, where the bulk of their power is derived from water, and at the same time they maintain a steam reserve to carry their load during low-water periods.

In some cases these system interconnections would involve a considerable expenditure of both time and money, in which event they would not be subject to immediate aggressive action by the administration but would be held in abeyance as possibilities for future consideration and development. In a great many instances, however, very considerable savings can be effected with a minimum of delay and expense, and it is along these lines that the first efforts will be most energetically directed.

LIMITING THE PRODUCTION OF POWER TO THE MOST EFFICIENT PLANTS AVAILABLE

We have been able to locate nearly 500 instances throughout the country where there exists in one form or another a duplication of power production and supply. In other words, there are communities where two or more central stations are furnishing electrical energy with systems paralleling one another.

In certain instances the results of such a condition are not serious, and in many cases they are probably unavoidable. Our investigations so far, however, have proved that a very large percentage of these situations offer an opportunity for large fuel conservation.

We find very often that an arrangement can be made at little or no expense whereby paralleling systems might be connected and the entire load supplied from the more economical station. In some cases possibly the combined load of both systems would be greater than could be handled by the more economical station. In such case as much load as possible should be carried by the station having the highest efficiency and the remainder taken by the other.

ECONOMY IN THE REFRIGERATING INDUSTRY

In co operation with the joint commission on refrigeration which was organized to assist the government during the war, the power and light division is planning to get in touch with the entire ice industry and to introduce a number of proved economies in the operation of ice and refrigerating plants.

A number of suggestions have already been made by the commission and by individuals connected with the industry. One plan that possesses merit and has possibilities of considerable fuel saving is that of allotting a definite amount of coal to individual plants, depending upon the size and type of plant, such allowances being based upon a reduction of 10 to 15 per cent of the average present fuel consumption. This will make it necessary to adopt many simple measures of economy that are now being overlooked.

Another possibility is that of producing white or opaque ice at a fuel saving of 5 to 20 per cent. This is accomplished by eliminating the power that is usually used for agitation in raw-water plants and for producing distillate in distilled-water plants, both of which are merely means of producing a transparent product. This is possible of adoption in many territories.

A further line of effort which will be productive of considerable economy, and one that was successfully applied last winter, is that of operating during the winter season only the most efficient plant or plants, as the particular case requires, in communities where

during the summer season all plants are required. This can be done and the individual business of each manufacturer will not be interfered with, as the arrangement provides that the operating plant or plants will sell at wholesale rates to those manufacturers whose plants are temporarily closed down. This arrangement also produces a saving in ammonia, and for this reason it was applied last winter at the request of the Food Administration.

In general, as regards the program outlined above, other important measures of conservation will be effected as follows:

First—By the closing of plants or the consolidation of plants there will be rendered available skilled men who are vitally needed in the many war industries of this country. Provisions are now completed whereby men with such training will be assisted in obtaining profitable work suitable to their ability.

Second—In many parts of the country there exists at the present time a power shortage. The interconnection of systems, the diversity factor of these systems considered, will render available additional quantities of power. The Council of National Defense is examining all communities where there is a surplus of power, having in mind the possible establishment in such communities of industries.

It may be stated that the conservation efforts of the Fuel Administration along the above lines are being directed so as best to serve the interests of all with a minimum of inconvenience and cost and with the object of making the coal supply that is available go as far as possible, so as to prevent the necessity of further drastic measures such as those of January.

It will be patent to every reader that in the face of a great potential shortage it would be criminal for the Fuel Administration to neglect obvious means of fuel saving such as those outlined above and equally criminal for the individual plant owner to refuse or defer co-operation which may have as a direct result a loss in production of war materials or which may jeopardize the health of many families through shortage in coal supply. The administration believes it should not be necessary to resort to the issuing of orders for the adoption of these conservation measures, but is relying, as in the past, upon voluntary action by those concerned and does not wish to enforce the measures where the saving in fuel would result in hardship to the owners not commensurate with the public benefit.

In this spirit the Fuel Administration invites co-operation, whether the question be one of interconnection, of operating plants at maximum efficiency or of temporary closing down of plants. We invite suggestions and criticism of a constructive nature from all sources.

Government Depending on Utilities

At a district meeting of the Ohio Independent Telephone Association in Columbus President Frank L. Beam, Mount Vernon, advised members to ask for fair service rates and to give full publicity to their costs and expenditures, so that the public may know and understand the reasons for any addition to the rates that may be requested. The government and all its branches, he said, are depending upon public service companies to an almost unbelievable extent.

The Manufacturers and the Central Stations

Makers of Electrical Supplies Have a Very Direct Interest in the Growth of the Power Houses—War-Time Conditions Make Co-ordination of Effort and Standardization of Material More Important than Ever

MANUFACTURERS of electrical supplies are following with keen interest the great activities and rapid development of central stations under the pressure of war conditions. Their own operations are affected by the volume of business of central stations and the progress of these properties. However, the manufacturers of supplies meet also a large demand from other classes of customers, and at present one of the most important of these is due to the war necessities, direct or indirect.

Conditions at this time, as well as the prospective situation, are of such vital importance to different branches of the industry that A. W. Berresford, president of the Associated Manufacturers of Electrical Supplies and vice-president and general manager of the Cutler-Hammer Manufacturing Company, was asked to discuss them for the *ELECTRICAL WORLD*, with particular reference to the relation between the condition of the manufacturers and the central-station industry.

DEMAND ON CENTRAL STATIONS AND THEIR RESPONSE

Mr. Berresford spoke of the remarkable enlargement in the demand upon central stations for power and commented on the equally remarkable showing which the central stations had made in meeting this demand. He expressed the belief that this increase in power consumption was not along the lines which it would follow under normal conditions, but, on the contrary, was due to the abnormal expansion of industry in mechanical lines consequent on government demands, and that in all probability a larger portion of the increase was being employed for industrial application than is normally the case. This condition seemed to indicate large potentialities of growth for the future, in that after the war there would be a direct reduction in demand of this nature and a consequent excess in the production of power which the central stations must immediately seek to utilize by building up new sources of business. The amount of excess power available will naturally depend on local conditions, since certain of the industries will undoubtedly be able to maintain their present consumption in peaceful pursuits, but to assume the present rate of production and consequent consumption of power would be the reverse of conservative. The result will be the resumption on an actual scale by the central stations of solicitation of power contracts, the intensive development of household appliance sales and a campaign for business of all classes that can be handled profitably under the load conditions present and with the result of stimulating the demand for the necessary material and exercising a direct and expanding influence on the business of contractors, jobbers and manufacturers.

Mr. Berresford expressed the belief that there could be no better time for co-ordinating the various branches of the electrical industry and that the probable future requirements make it highly important that the interests of the different divisions be brought

closely together so that co-operative action might be taken. He pointed out that the manufacturers, by reason of their three organizations and the bond of union established by the Electrical Manufacturers' Council, were in admirable position to co-operate and indicated that through the council, or through some similar agency, the various branches of the business could be brought into more intimate contact and the problems which are common receive the necessary consideration.

STANDARDIZATION OF MATERIAL

In the matter of standardization of material, in which the National Electric Light Association is interested, Mr. Berresford stated that the interest of the manufacturer was identical with that of the central station, the jobber and the contractor, and that much could be accomplished by co-ordination of effort. It should be understood, however, that no one element can effect the desired result and that the interest and the point of view of the actual user of the goods must be consulted. The standardization of a device implies the elimination of a number of forms to which the customer has become used and the substitution therefor (and in some cases at a disadvantage) of the ultimate form agreed upon. This can take place only as rapidly as the customer is willing to accept the change, and the goods can be offered to the customer only as rapidly as the manufacturing program and the condition of jobbers' and contractors' stocks permit.

He expressed his appreciation of the value of the suggestions made by the National Electric Light Association, but felt that more rapid progress would probably result if the association would refer direct to the manufacturer devices which it felt were most important for standardization and most amenable to such treatment, which process would not require detailed consideration from the National Electric Light Association beyond the compilation of the needs of its member companies. The manufacturer could then determine what was possible and could submit his conclusions to the standardization committee of the National Electric Light Association.

MANUFACTURERS READY TO CO-OPERATE

Mr. Berresford had no hesitation in stating that the Associated Manufacturers of Electrical Supplies would be glad to work toward a solution of the problems presented and expressed his confidence in the ability of that association to obtain careful consideration by experts of the particular devices under discussion and to arrange for the meeting of such experts with the National Electric Light Association committees interested, and he further expressed the belief that a similar co-operative attitude would be taken by the other manufacturers' associations. Mr. Berresford believed that, in spite of the depletion of forces due to military requirements, the present time would be an excellent one to take up this work. He felt that this

depletion was more than offset by the development of the manufacturing organizations toward co-operative consideration of questions of this nature.

In speaking of business conditions as they affect the manufacturers of electrical supplies, Mr. Berresford drew attention to the amount of material needed by the government to the production of which the plants and machinery of such manufacturers was suited and commented on the fact that up to the present the electrical manufacturer had, to a large extent, permitted the machine shop rather than the electrical shop to provide the bulk of this material. He insisted that from both the patriotic and economic standpoint it was incumbent on the electrical manufacturer to see that his due proportion of this work came to him, so that, while doing his duty as a citizen in the present crisis, he might still maintain his organization and cope with conditions which would arise on the cessation of hostilities.

The character and amount of such work which can be taken in each shop can be determined only by the individual manufacturer after a study of the conditions at home and in Washington, and the work can be obtained only by the intelligent expenditure of personal effort at Washington in the presentment of his facilities and claims. There are two facts which should not be overlooked by the manufacturer in considering this work and determining the minimum profit basis on which he can afford to accept it—namely, that for the bulk of this detail manufacture no financing is required except the buying of such minor additions to machinery as may be necessary, and that practically no additions to material inventory are involved. Furthermore, after a manufacturer has satisfactorily produced goods for the government, the tendency is to keep him at work, and even if a manufacturer fails to obtain a second contract immediately after completing the first one, he is still in favorable position on the records at Washington as having produced goods and as competent to handle more business.

Readers of the *ELECTRICAL WORLD* are familiar with the work of the General War Service Committee of the Electrical Manufacturing Industry, which is serving as a connecting link between the government and the different groups of electrical manufacturers, and whose particular function it is to place before the government the ability of the industry to produce material which is essential for the prosecution of the war.

Mr. Berresford believed that the work of the war service committees should not be expected to take the place of an individual manufacturer's presentation to the government of his own capability. He felt that the best results could be obtained only by the personal effort of the manufacturer himself operating under the advice of the General War Committee.

Mr. Berresford furthermore expressed the belief that if the manufacturer did not follow the course indicated he would find that, while he might not be relegated to the class of non-essential industries, such percentage of his production in normal lines as was not needed at this time would in effect take this classification and that the influences which are being brought to bear must tend toward a corresponding diminution of production to the amount actually necessary and a consequent reduction of his organization and working force to the minimum required to make this production, whereas the pros-

perity of the country, as a whole, as well as the individual industry, demanded the operation of full capacity of all plants possible and is a fundamental in the maintenance of the morale of the people, our business position and our financial ability to make loans and pay taxes.

If the plants are maintained in operation, intelligent study will indicate the direction in which the character of the product can be shifted and this policy will prevent ruin of any industry. The government cannot afford, and does not desire, to interfere with the operations of any manufacturer beyond what is actually necessary to insure the output of war material. It can, however, only lay down general laws which shall govern, and it is the duty of the individual so to adapt his operations to these laws and the changed conditions as to maintain his condition of profitable operation substantially unimpaired.

Red Cross Bandage Output Increased Ten Times by Electricity

At the Boston (Mass.) workrooms of the New England surgical dressings committee a machine is now in service which has a capacity of 50 yards (45.7 m.) of gauze bandages per minute, an electric drive being a feature, as illustrated herewith. The machine was de-

MAKING BANDAGES WITH ELECTRICITY'S AID

signed by J. A. Butler of the Industrial Service & Equipment Company, Boston, and easily will turn out ten times as much work as the usual staff of four persons can perform by hand. The machine will produce two sizes of folded bandages, one 4 in. (10.16 cm.) and one 3 in. (7.62 cm.) wide, and the number of cutters of dressing stock is varied to suit the convenience of the local workers. In operating the machine one worker feeds the material through the outfit and the others devote their time to cutting and packing. A Singer sewing-machine type motor of about 1 7-hp. rating, operated by 110-volt direct-current energy from the Boston Edison mains, runs the unit. The bandages are folded eight or four times as desired. Recently the Boston chapter of the Red Cross had a rush order of dressings to prepare, and the work was done on this machine in four days, 2000 5-yd. (4.5-m.) gauze rolls being made up. By hand the work would have taken at least three weeks with the local staff then available.

In League with the Government

How Central-Station Executives Are Assisting the Nation in Solving Local and National Problems and Safeguarding the Country's Electric Service Despite Handicaps

VARIOUS aspects of a central-station executive's war service, including the work of gas and electric utility representatives at Washington, were touched upon at a recent hearing before the Massachusetts Gas and Electric Light Commission by President C. L. Edgar of the Edison Electric Illuminating Company of Boston. In an informal way, Mr. Edgar outlined his own connection with the work. In August, 1916, he was appointed by Secretary Daniels an associate member of the Naval Consulting Board, and with others was asked to make an inventory of the manufacturing concerns of Massachusetts. This work was organized with C. H. Hodskinson of the Boston Edison company as secretary and treasurer and occupied about a year. All the manufacturing concerns in the State were communicated with, their machinery and products were listed and consideration was given to the possibilities in the way of changing over products in case of war. The work was done under the direction of N. S. Gifford, now manager of the Council of National Defense. When the latter organization went into effect the work Mr. Edgar and his associates had been doing for the Naval Consulting Board was automatically turned over to the Council, under Howard Coffin, who had charge of this class of work for the defense board.

War was then declared, and Mr. Coffin called into conference some of the leading men in the gas and electric utility fields, those of electrical affiliations from New England being Mr. Edgar and Henry G. Bradlee of the firm of Stone & Webster. By an informal vote Mr. Edgar was made chairman of the advisory committee, and at a later date the committee organized with offices in the Munsey Building, Washington. It has since been actively at work advising the government and has invariably refrained from anything commercial. In fact, Mr. Edgar pointed out, when the toluol situation came up and it was found that one or two of the committee were interested in that product, they resigned, as they did not wish to embarrass the committee in any way. Before long the committee was drafted to assist F. S. Peabody, who was Dr. Garfield's predecessor as fuel administrator. The work of the committee in-

creased to a point where additional assistance was needed, and this was furnished by the United Gas Improvement Company, Philadelphia, the New York Edison Company, the Philadelphia Electric Company and the Boston Edison company, Mr. Hodskinson being loaned by the last company for one or two months.

With the growing acuteness of the coal situation, the time came when it could not be handled by the routine purchasing department of the Boston company for its own service, and for two months Mr. Hodskinson devoted his entire attention to this question. James J. Storrow, federal Fuel Administrator for New England, has stated openly that Mr. Hodskinson helped him probably as much as anybody in Boston. The Boston company loaned 7000 tons of coal on one occasion to the Maine Central Railroad, when it was practically out of fuel, and kept the Boston City Hospital going for two days, all of this being due to the work done by Mr. Hodskinson at Washington and Newport News.

Later Mr. Edgar was appointed a consulting electrical engineer of the Bureau of Mines, Prof. L. P. Breckenridge of New Haven, Conn., being chairman of the committee of engineers which

aids both the Bureau of Mines and the federal Fuel Administration. Mr. Edgar served on a committee which was asked by the War Department last winter to obtain 80,000 hp. in steam turbines for government nitrate-plant service, the necessary units finally being borrowed from the central stations of the country. Two months ago the government found it necessary to establish another war plant of 100,000 kw. for service in connection with the Du Pont interests, and Mr. Hodskinson was called into the case to assist in obtaining the necessary units. A 30,000-kw. unit ordered by the Boston Edison company and another ordered by the Boston Elevated Railway were taken over by the government. Others built later will replace them.

With regard to letting the Boston Edison generating unit go to the government, Mr. Edgar said: "I acquiesced, as far as we were concerned, because I thought the government officials were justified in taking it. I thought it was needed more by the government than by us."

C. L. EDGAR

Mr. Edgar has been almost every week in Washington for many months, doing work entirely outside that of the Edison company. This work has been almost entirely in consultation with other companies to see what could be done to help the government. D. S. Boyden, assistant to the electrical superintendent of the Boston Edison company, has been of much assistance to the New England Fuel Administration and has prepared various questionnaires for it. Mr. Edgar said that both he and Mr. Hodskinson were getting overwhelmed with war work, and accordingly Sidney Hosmer, head of the Boston Edison construction bureau, has been assigned to give his whole time to war service questions and has lately been in Washington for this purpose. Mr. Edgar is constantly being importuned along different lines for assistance, recently having been called up by telephone on a Sunday morning and asked to release a condensing unit to government service. The company did not give the turbine and condenser equipment outright to the government, but postponed deliveries, rearranging the orders with the manufacturers so that the material now being collected can be put into the machinery which the government needs for more important work, the central-station machinery to be put together a few months later. "I do not want to make a stump speech," said Mr. Edgar, "and am not going to do so, but I think I am justified in saying that 90 per cent of my thought the past year has not been with the Edison company but with the work of the government. I was told by my directors when the war started that I might have a year's leave of absence, but I thought I could do better service along the line in which I have been working. I thought I would be of more use to the community and to the country by dabbling in a lot of things, as I have, rather than by cutting loose and giving my entire time to one thing."

Mr. Edgar said he was in sympathy with what the government is doing relative to plant correlation and control, although in some cases it is difficult for the companies to accommodate their operations to meet the demands of the army officers in charge of the local situations, as at Niagara. Mr. Edgar stated that he proposed to play the government's game despite the handicaps which it may impose. All these activities bearing upon control of utility administration bear upon the question of regulation and support the company's general contention that the present is not the

time to subject the companies to such a rate inquiry as is proposed in the Boston Edison case now before the commission. One of the problems to be discussed at the forthcoming Atlantic City Convention of the National Electric Light Association is the possibility of reducing some of the labor shortage of the central stations through rendering bills every two months. Other war problems will be discussed at this time, and Mr. Edgar said that at the next hearing he expected to make a more detailed statement bearing upon the company's contention that for the period of the war the rate inquiry should be suspended.

ENGLISH RESTRICTIONS ON ELECTRICAL PURCHASES

Applications to British Ministry of Munitions for Priority Certificates to Buy Apparatus Must Show Energy Supply Conditions

Applications to the British Ministry of Munitions for priority certificates to permit the purchase of motors and other electrical apparatus now have to be accompanied by a certificate from the chief engineer or manager of the public service undertaking concerned. This certificate is to state:

1. That adequate generating plant capacity is or is not available.
2. That no additional cost or material is involved in connecting the premises to the mains (including substation equipment, if any), or
3. Where expense is involved the material and apparatus to be provided and the cost thereof, and whether lead-covered cable is necessary or not. Where lead-covered cable is deemed necessary, the voltage of the current transmitted should be stated.

Applicants should, whenever possible, also obtain the written support of the government department interested in their manufactures, and forward a copy of same.

The purpose is to reduce the demand for energy—other than that used for urgent war purposes—supplied by the public service undertakings and the time occupied in making inquiries.

New restrictions relating to electric converter plant have also been issued by the British Ministry of Munitions. Applications under this order are to be made to the director of electric power supply in the Ministry of Munitions.

Backing Up the Fuel Administration

A 4000-kw. outdoor substation (at right) supersedes a 3364-kw. Attleboro (Mass.) steam plant (at left), saving fuel and a freight rate of 60 cents per ton on coal through interconnection with the Providence (R. I.) central station.

Ships Are as Important as Guns

The largest shipyard in the world fills all its power requirements from central-station sources, and so does the

smallest. It matters not whether the ships are built of wood, concrete or steel, electricity is used in the erection of all.

What Commissions Are Doing on Rates

Action Taken by Various Public Service Commissions Regarding Increases Sought or Made on Account of Higher Operating Cost—Views as to Duration of High Expense Ratio

As the result of a survey of the broader aspects of tendencies of electric rates in the war crisis, the *ELECTRICAL WORLD* will present several articles. This, the first one, will be followed by others in later issues.

WAR problems have thrown a new and burdensome responsibility upon the public service commissions of the various states which have thorough regulative statutes.

Put into office by the public, intrusted with a clear obligation to both the consuming public and the supplying utilities and their security owners, these bodies face a critical test, if not a grave crisis, in the history of regulation. They hold great and unavoidable authority over the electric properties and the consumers in their relations toward each other. How they are exercising this authority, whether they have a full appreciation of the changing conditions due to the war, is of vital concern for the future of regulation.

Under the pre-war conditions the electric utilities followed generally the practice of reducing rates and building up large volume of output. Now that conditions of cost and demand are influenced powerfully by war requirements, many utilities find that a partial reversal of practice is necessary to preserve their financial integrity unimpaired.

That the commissions are alert to the possibilities of the altered economic situation is shown by replies to inquiries made by the *ELECTRICAL WORLD*. They want to know the facts and apparently they are not unwilling to regulate rates upward when the facts so justify.

HOW WISCONSIN DECIDES

Among the state commissions the deliberations and conclusions of the Railroad Commission of Wisconsin have been followed with care from the beginning because of the standing of the men who have composed its membership and its staff.

Harold L. Geisse, the secretary, writes to the *ELECTRICAL WORLD*:

"We have authorized a number of electric utilities to increase rates for limited periods subject to review by the commission at any time, on account of the showing of increased cost of operation. In connection with this, however, it should be said that the commission does not consider the increased cost of operation in and of itself as a justification for increasing rates. The application in each of these cases is judged with reference to the extent of the emergency which has been caused by the increased expenses, and if an emergency does not exist, or if the conditions of the utility for years past has been so good that it can be expected to carry a part of the burden for a time, the commission would not be disposed to authorize emergency relief. This would not in any way, of course, prevent the utility from bringing a case in the regular order of events, not under the emergency statute.

"In some cases the rate increase has been applied to all classes of customers, and in others to only such

classes as were receiving the lower rate and in whose rate the coal component was a relatively large part.

"The number of applications has not been large. An increase was granted:

"To the Milwaukee Electric Railway & Light Company and the Milwaukee Light, Heat & Traction Company of 0.31 cent per kilowatt-hour for all energy above 1000 kw-hr. per month.

"To the Eastern Wisconsin Electric Company, Sheboygan, 0.25 cent per kilowatt-hour for all energy except the general lighting.

"To the Eastern Wisconsin Electric Company at Fond du Lac, 0.5 cent per kilowatt-hour for all service.

"To the Wisconsin Traction, Light, Heat & Power Company at Appleton, Neenah and Menasha an increase was granted which had the effect of eliminating all energy steps of less than 8 mills.

"There have been one or two other minor increases in the case of small plants.

"Not many of the electric utilities have as yet filed applications for authority to increase rates, although those acted upon involved some of the larger companies in the State.

"We have been proceeding in the hope that the abnormal condition would be corrected, and accordingly have granted increases only for limited periods. However, it seems to us very doubtful if these conditions will actually be corrected to anything near normal for at least several years."

COAL THE DOMINANT FACTOR IN MASSACHUSETTS

The Massachusetts Gas and Electric Light Commission has had to take no action upon electrical rate increases since last summer, first, because no rates fixed by the board have so far been increased; second, because no statutory complaint of the actual increases put into effect by electrical utilities has been received. In the absence of these causes for investigation and decision, rates established by utilities go into effect without review by the commission in any formal way.

About forty announcements of increases have been received from electric utilities or gas companies' electrical departments and twelve from municipal plants. Almost all of these have been increases in power rates. A careful study of the titles of these announcements of increase, as summarized by the commission's office, shows that the most general increase is about 0.5 cent per kilowatt-hour on power rates ranging say from 4 to 6 cents, and that a rough approximation of these increases would be about 10 per cent.

No exact average can be deduced from the tariffs filed, however, as in some cases the discounts are altered; in others the blocks of energy at stated rates have been changed; in others minute fractions of a dollar represent the advance in energy price corresponding to changes in the price of coal, and, again, certain special rates, like window lighting and flat-rate residence lighting, have been modified or abolished. In some cases the power rate increase is as low as 5 per cent. Very little evidence of organized opposition to the

electric rate increases appears to have materialized.

One advance in lighting rate, from 8 cents net to 8.5 cents per kilowatt-hour (Seekonk), is reported, but so far the commercial lighting rates have been practically untouched.

About ninety-three electrical utilities are under the supervision of the board, and from 40 to 50 per cent of these have established some electrical rate change calculated to yield increased revenue to the company.

Present conditions affecting rates appear to be largely in the nature of a war emergency, with the increased cost of coal a dominant factor therein.

WHAT MICHIGAN THINKS OF COSTS

Cassius L. Glasgow, chairman Michigan Railroad Commission, writes:

"Most of the utilities in this State are operating under franchises granted by the municipality in which they are located and which control the rate. In two or three instances complaints have come to this department, and we have recommended that they be taken up with the local authorities to see if an adjustment could not be made, even temporarily, during the war.

"In one instance a village has made complaint to this department and hearing has been had thereon, and the public utility has been permitted to charge an increased rate both for private and public lighting and to add power service. This has not been limited to the duration of the war owing to the fact that a reconsideration of this rate may be had at any time upon the application of either party.

"It is our opinion that the things which contribute to the expense of operating public utilities will never so decrease in price as to permit them to operate under the old schedules successfully. However, we believe, where during the duration of the war they have been permitted to name a rate which would produce a reasonable return based upon present expense of operation, that when after the war these expenses will somewhat decrease, naturally the public will demand a like reduction in the rates."

SEVENTY PENNSYLVANIA COMPANIES ACT

H. E. Ehlers, chief of Bureau of Rates and Tariffs, Public Service Commission of Pennsylvania, says:

"It is not the practice for utilities in this State to make application for increases in rates, as the public service company law provides that changes in rates may be made by the filing, publishing and posting of the changes, giving thirty days' notice, when the changed rates automatically become effective on the effective date fixed. Such rates are at all times subject to investigation upon complaint.

"For your information I wish to state that approximately seventy companies have filed increases in rates to become effective this year. A number of the increases have been filed as effective for one year, or during the period of the war."

STATUS OF CASES IN VIRGINIA

Alexander Forward, commissioner of the State Corporation Commission of Virginia, writes:

"Necessary increases in cost of operation are considered favorably, and it may be in some cases entirely, for the purpose of authorizing increased rates.

"In regard to what classes of rates are increased, this would depend largely upon the relationship of rates

between the different classes, but in most of the cases recently passed upon by us all rates of the electric utility were revised.

"We have approved increases in some seven or eight instances during the past year, have not rejected any applications relating to electricity and have two cases now pending.

"Our records show that forty-nine utilities of this character operate in this State, so that at present only about 4 per cent of them now seek higher rates.

"In regard to the present general conditions, particularly as to operating costs affecting electric utilities, we feel that this condition is temporary, and in authorizing increased rates, unless cause is shown to the contrary, it is our custom to limit the increased rates so as to expire on some future date, subject, however, to further hearing at some later time."

HOW RHODE ISLAND VIEWS CONDITIONS

From information obtained by a representative of the ELECTRICAL WORLD from the Public Utilities Commission of Rhode Island the following is stated:

Increased cost of operation of course would be a factor in the determination of the commission in case exhaustive rate proceedings were instituted; but no formal hearings have been required of late for the reason that there has been no statutory opposition to the increases effected.

It may be assumed that the commission would not approve any grossly discriminating increases in class rates, its policy being rather to permit such generally fair advances as are justified by the present conditions. A particular rate may be altered, as in the institution of the minimum charge on residence lighting installations lately placed in effect in Providence, but this does not mean that the other consumers were penalized.

In general, the electric companies informed the commission in making recent advances that they expect to meet about half the increased cost themselves through more efficient operation, looking to the consumer to bear the other half of the increased costs in the shape of higher rates.

About twelve schedules of rate advance have been received and allowed during the last six or eight months. Very roughly, it may be said that the advance in power rates is of the order of 20 to 25 per cent, and in lighting rates in the vicinity of 10 per cent. In Rhode Island, both power and lighting rates have advanced synchronously. No proposed advances have been rejected and none are now pending.

Practically 100 per cent of the electric utilities under the supervision of the commission have sought increases and obtained them. Owing to centralized management some of these schedules have been filed and put into effect by groups, as in the utilities controlled and operated by the Narragansett Electric Lighting Company and the Stone & Webster organization. The companies have worked in harmony with the local authorities and publics, showing them the need of an increase, and the public has generally appreciated the situation.

It is the view of the commission's chairman, W. C. Bliss, that the present operating costs and conditions of electrical utilities are in considerable degree of an emergency character, but it is not expected that there will be a rapid return to former levels of cost at the close of the war as regard coal and labor expense.

FIG. 1—105,000-KW. L STREET STATION OF THE BOSTON EDISON COMPANY, WHICH WOULD BE INVOLVED IN INTERCONNECTION

Benefits Possible from Interconnection

Analysis of Conditions in Eastern Massachusetts—Possibilities of Higher Efficiency, Reduced Investment and Operating Expenses per Rated Kilowatt, and Releasing Equipment for New Business

FIFTY thousand kilowatts in plant equipment can be released on central-station systems north and south of Boston, Mass., by a comprehensive development of the interconnection plan, according to L. L. Elden, electrical superintendent of the Edison Electric Illuminating Company of Boston, who addressed the New England Central Station Power Engineers' Association recently. It is estimated that this benefit could be realized within a few months, so far as the engineering side of it goes, and with an outside expenditure of about \$2,750,000. The improvement in load factors in the local plants would result in greatly increased efficiency of operation, permitting the less economical stations to be shut down for at least a large part of the year and saving coal on a substantial scale.

Mr. Elden's conclusions have been reached as the result of personal studies of the load conditions in the eastern Massachusetts district and his knowledge of the benefits of interconnection as developed in various parts of the country.

Prior to 1914 most interconnections were between plants under the same management or control, the objects being to secure greater efficiency and to conserve reserve capacity. One of the best examples of interconnection is the system of the Pacific Gas & Electric Company, in which steam and hydroelectric plants are operated jointly and with maximum efficiency. It is estimated that about double the present investment would be required if the plants now tied together in this system were not operated under a single control. Other important interconnected systems are operated by the Southern Power Company and the Mississippi River Power Company. In the Montreal district five large companies are operating steam and hydroelectric

plants under one control and with marked advantages. The New England Power Company and the Turners Falls Power & Electric Company are interconnected in New England with good results, and the Public Service Corporation of New Jersey is planning a transmission trunk line of state-long dimensions, into which seven or eight large steam plants will feed, reducing independent reserve capacity and saving fuel. The government is planning to build a large plant at the mouth of the mine in Pennsylvania for transmission of electricity to munition plants in the Philadelphia and New Jersey districts.

BETTER LOAD FACTOR IS ONE BENEFIT

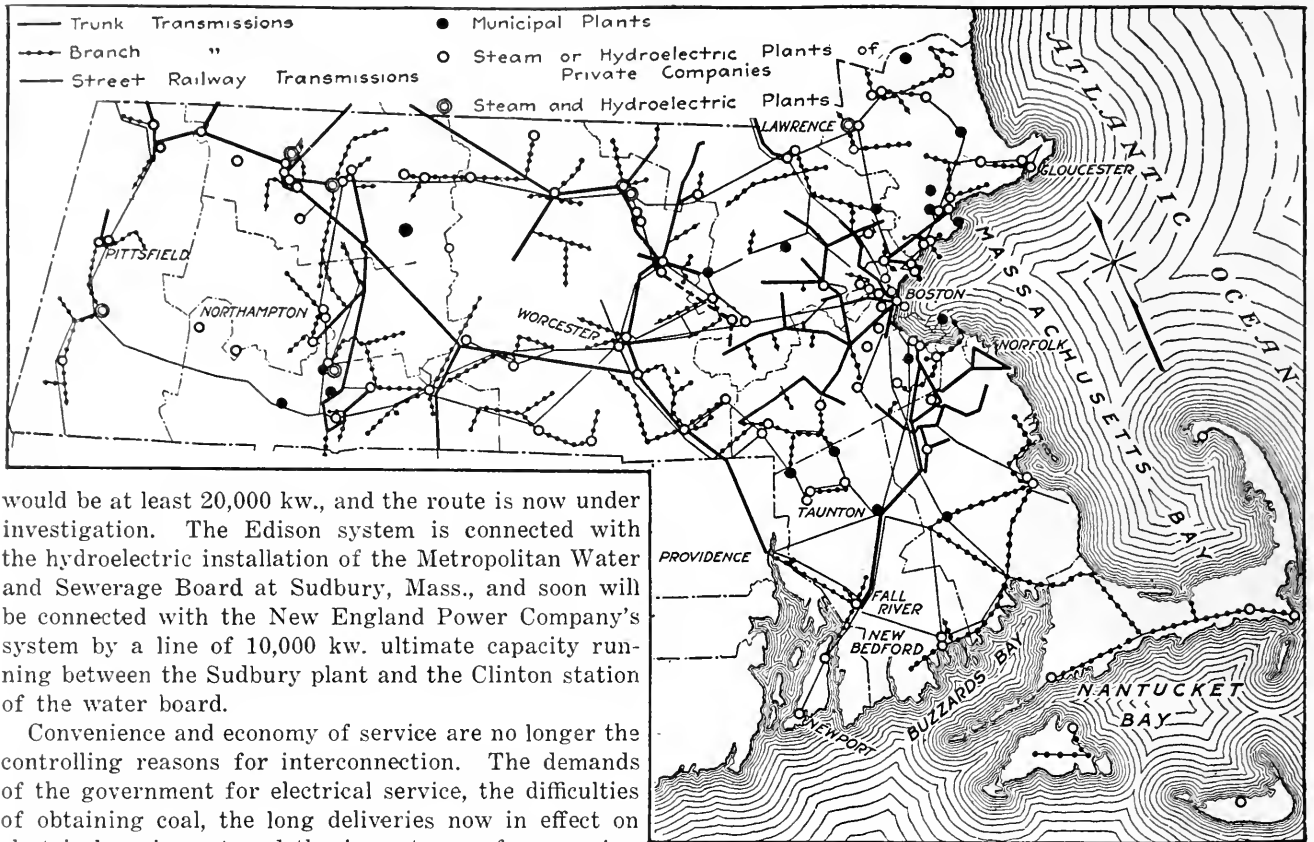

An improvement in load factor generally follows interconnection. The more economical plants can be operated at their maximum efficiencies, reducing costs and investment charges and giving a better diversity factor. Thus, 10,000 kw. can be sold out of the combined reserve of two plants with the following characteristics when interconnected: Plant A, five 10,000-kw. units, maximum load 40,000 kw., spare capacity 10,000 kw.; Plant B, three 10,000-kw. units, maximum load 20,000 kw., reserve capacity 10,000 kw. Interconnection gives a constant reserve of 10,000 kw. for whichever plant requires it, safeguarding the service of each plant as well as before, since coincident peaks are not likely to occur. The combination of 80,000 kw. capacity in two adjacent interconnected plants may easily give an available excess capacity of 25,000 kw., a difference of ten or fifteen minutes in the peaks being sufficient to release this maximum capacity. In such a case 10,000 kw. can be held in reserve and 15,000 kw. sold for new business. The percentage of spare capacity is larger.

smaller plants and the benefits of interconnection are great even in stations of very moderate size.

NEW ENGLAND INTERCONNECTION OPPORTUNITIES

Within the last eighteen months considerable work in tie-line construction has been done in Massachusetts. The Malden-Salem-Revere line (described in the ELECTRICAL WORLD of Sept. 1, 1917) is giving excellent service, and there will shortly go into operation a tie line between the Revere plant of the Suburban Gas & Electric Company and the Edison Electric Illuminating Company of Boston, with a capacity of 3000 kw. There is now under consideration by the New England Power Company the construction of a 66,000-volt transmission interchange line to extend from some suitable point to the L Street station of the Boston Edison company, in South Boston. The capacity of this line

area was about 50,000 kw. and the sum of the peak loads was about 40,000 kw. Owing to the non coincidence of peaks, there would be a total spare capacity of 20,000 kw. through interconnection, excluding any tie line to the Boston Edison station and plants serving traction lines in the districts reached by the trunk line. All these central stations were developing about 70,000,000 kw.-hr. per year, the average coal consumption being 2.84 lb. (1.28 kg.) and the range from 2.27 lb. to 6.4 lb. (1.25 kg. to 2.88 kg.). Assuming an average of 2 lb. (0.9 kg.) per kilowatt-hour, which could be attained by the improvement of station load factors resulting from interconnection, 28,000 tons of coal could be saved in a year by interconnection, and at \$8 per ton this would represent an annual saving of about \$225,000. On the basis of \$80 per kilowatt, the saving in capacity resulting from interconnection would repre-

would be at least 20,000 kw., and the route is now under investigation. The Edison system is connected with the hydroelectric installation of the Metropolitan Water and Sewerage Board at Sudbury, Mass., and soon will be connected with the New England Power Company's system by a line of 10,000 kw. ultimate capacity running between the Sudbury plant and the Clinton station of the water board.

Convenience and economy of service are no longer the controlling reasons for interconnection. The demands of the government for electrical service, the difficulties of obtaining coal, the long deliveries now in effect on electrical equipment and the importance of conserving reserve capacity are most influential. The government has taken possession of the second 30,000 kw. turbo-generating unit ordered by the Boston Edison company for its L Street station extension, on the ground that the federal authorities have a more immediate and pressing use for this machine than its purchaser.

About eighteen months ago Mr. Elden made a comprehensive study of the possibilities of interconnecting the principal central-station systems north and south of Boston, tying these into the Edison system, and it is known that the ratios obtained prevail to-day. An outline of the investigation made by Mr. Elden is accordingly presented.

The plan involves, on the south of Boston, the establishment of a trunk line interconnecting the Boston Edison plant on tidewater at L Street, South Boston, with various local generating plants through appropriate taps or branches. In 1916 the capacity of the local central stations in the general southern Massachusetts

FIG. 2—INTERCONNECTIONS IN MASSACHUSETTS THAT ARE RELEASING EQUIPMENT FOR NEW BUSINESS

sent \$1,600,000, which would thus be available for handling additional service as required.

If existing rights-of-way could be utilized in connection with this plan, which seems probable, the cost of such line construction or reconstruction as might be required, including local substation work, would probably not exceed \$1,250,000. The principal source of delay would be in obtaining the substation equipment needed for comprehensive development. Allowing fixed charges on this work at 15 per cent, there would be a saving of at least \$75,000 in fuel alone, entirely ignoring labor economies. It appears that at least six plants could be shut down in the local territory a part of the year, and the bulk of the load would be handled by the larger and more efficient interconnected stations. The 1918 output of the stations in the area under consideration is estimated at about 100,000,000

FIG. 3—20,000-KW. VERNON CENTRAL STATION, NEW ENGLAND POWER COMPANY, ON CONNECTICUT RIVER

FIGS. 4 AND 5—TRANSMISSION-LINE TOWER, EASTERN MASSACHUSETTS ELECTRIC COMPANY, AND DISPATCHING HEADQUARTERS, NEW ENGLAND POWER COMPANY

FIG. 6—NARRAGANSETT ELECTRIC LIGHTING COMPANY'S 80,500-KW. PROVIDENCE STATION

FIG. 7—INTERCONNECTION LINE RUNNING NORTH OF THE CITY OF BOSTON

kw.-in. and the financial return on such an interconnection plan would be far better, Mr. Elden said, than on many electric power developments proposed.

On the north of Boston, in 1916, there was a total generating capacity of 84,000 kw. in the central stations between the Boston system and southern New Hampshire. The combined peak loads were 58,000 kw. The average coal consumption was 3.09 lb. (1.39 kg.) per kilowatt-hour, and by interconnection it is estimated that a saving of 42,000 tons of coal could be realized per year. The construction cost of the necessary trunk tie line would be about \$1,500,000 at the outside. The fixed charges and upkeep of the line, at 10 to 12 per cent, would not exceed \$150,000 to \$180,000 annually, and at \$8 per ton the coal saving would be double this amount. The interconnection would presumably include about sixteen stations. The coal consumption of a representative group of these ranged in 1916 from 2.69 lb. to 13.34 lb. (1.21 kg. to 6 kg.) per kilowatt-hour. At least six plants probably could be discontinued, and for eight months of the year half a dozen or thereabouts of the larger plants would handle the load. The value in generating capacity rendered available for other purposes through interconnection is estimated at \$2,400,000, or about 30,000 kw.

The entire interconnection plan, it is estimated, would therefore save at least 50,000 kw., representing an investment of about \$4,000,000 and an annual reduction of coal consumption amounting to at least 70,000 tons. A conference between engineering and legal representatives of the various companies should be able to arrange equitable terms of financial interest and the operating arrangements would be comprehensive and not over-difficult. The cost of the new construction might be met by pooling of company interests, but probably a more satisfactory method would be by the formation of a company to handle the interconnection program, each company then contributing to a sinking fund a proportion of its savings based upon its kilowatt-hour output. With coal at \$5 to \$6 per ton the investment could be wiped out in less than ten years and all the differences between fuel at these prices and at from \$6 to \$8 per ton would be compensated for by the larger output of the systems grouped about the tie line. A single-circuit tie line would meet the conditions in view of the fact that the associated plants would feed into this line from the ends and from intermediate points. Finally, there would result from such interconnection, with scientific operation, not merely coal saving but a reduced generating cost which ultimately might properly be reflected in lower rates for electric service.

New Headquarters Offices for New England Power Company

The New England Power Company has begun the erection of a new headquarters office building at 35 Harvard Street, Worcester, Mass., to replace the building destroyed by fire in March. It will have a frontage of 42 ft. and a depth of 70 ft. and will be of brick construction. The general offices will be on the first floor, and executive offices, drafting and engineering rooms will occupy a second story. There will be a repair shop in the basement. The temporary office of the company is at 26 Howard Street. S. C. Moore is general manager.

GOOD LIGHTING HELPS

IN WINNING THE WAR

By Decreasing Accidents and Spoilage and Increasing Production Electric Lighting Is Doing Its Part to Hasten Victory

MUCH has been written concerning the tremendous value of electricity in the successful prosecution of the war, and almost always, when linked up with the central station, it has been the electric motor that was referred to. To be sure, the application of electric power to America's industries has made it possible to continue production in many plants and to augment greatly the output in others.

However, though perhaps less apparent, yet the lighting of a plant is none the less important. In no small measure have the Allied armies in Europe been able to put up such a good fight because of the quality of electric light in the munition and allied plants. Guns, ammunition, food, clothing and all the other necessities for our fighting forces are needed in quantities. Quantity production in this sense means maximum production, and this means working day and night. Light, therefore, and good light, is a necessary adjunct of our army and navy.

With this thought in mind, the ELECTRICAL WORLD canvassed a large number of the leading manufacturing and industrial plants in the United States in order to show as concretely as possible the value of good lighting. In all of the plants electric light in one form or another is employed. In a majority of the reports it was stated that new lighting systems had recently been installed, and in not a few cases it was stated that different forms of lighting were continually being tried out in order to get the best artificial lighting arrangement possible. It was particularly noticeable that manufacturers are changing from the inefficient carbon lamp to the tungsten lamp, and particularly the gas-filled unit.

Another frequent change noticed was from arc lamps to tungsten incandescent lamps. There were also a number of instances of change from mercury-arc to tungsten lamps.

The reports showed a disposition to depart from the use of bare lamps, and in quite a few cases it was reported that lamp candlepower was considerably increased. Instances were also noticed of changes from clusters to single lamps.

BETTER SPIRIT OF LABOR WITH GOOD LIGHTING

Manufacturers were asked in cases where changes in lighting had been made whether there was any noticeable effect on the workmen. In most cases no effect was noticed, but this cannot be taken at its face value. Manufacturers generally are sold on the benefits of good lighting and do not take the trouble to investigate the effects for the sellers. In a large number of instances, however, it was noticed that the workmen showed a better spirit and went at their work in a happier frame of mind when the lighting conditions were improved. The efficiency of employees was also better.

One factory making molded insulation on changing from carbon and arc lamps to tungsten and gas-filled lamps with reflectors noticed an increased output of the benches of 75 per cent. A sugar mill changing from carbon to tungsten lamps with reflectors noticed an in-

crease in output of the night shift of 20 per cent, besides eliminating bad batches of sugar.

The great value of lighting to-day is its effect upon labor and therefore upon output both in quality and quantity. In this connection a superintendent of one of the largest explosives plants in the United States said to the *ELECTRICAL WORLD*:

"Since in our munition plants we are operating night and day, the question of lighting is an important one. In fact, one must have good lighting in order to keep up our production, avoid accidents and produce better esprit de corps."

Labor to-day, notwithstanding statements by organized labor to the contrary, is very scarce, and, what is more, the indications are that it will be worse before it gets better. There are any number of shops suffering from labor insufficiency—shops where every minute of occupied labor counts in the production of necessities.

Consequently the element of man-hours assumes an importance not previously known. An accident, with the resulting loss in time by one or more operators injured, is no longer a dollars and cents proposition but rather one of output—the output of goods so sorely needed by the nation and its allies. Besides, when an accident occurs it is not only the injured who lose time. The psychological effect on the other workers is such that considerable time is lost and a large part of the day's output of those near the accident is lost through spoilage due to nervousness.

ACCIDENTS DECREASED

It is apparent, therefore, that anything tending to decrease industrial accidents has a very real value in helping to win the war. That lighting is in the category of an accident preventer is evident from the replies received by the *ELECTRICAL WORLD* in its canvass.

In one plant a new system of lighting so reduced the number of accidents that the company decided to carry its own insurance. A company engaged in the manufacture of zinc concentrates states:

"We have a remarkably small number of accidents, although more than 1000 men are employed. We attribute part of this to adequate lighting, which is in line with the safety first idea."

A leather manufacturer states: "Improved lighting naturally lessens accidents, particularly around elevators and machinery."

A statement from a plant milling low-grade copper is to the effect that "Light exposes danger. Good lighting is insurance against accidents."

Another copper-concentrate plant says: "We believe that better lighting has done its share in reducing our accidents more than 50 per cent."

Not only does better lighting prevent much of the loss of time resulting from accidents but also that resulting from poor health. With good and adequate lighting it is possible to keep the plant cleaner and more sanitary and to reduce eye strain and headache.

That good lighting helps to build up esprit de corps seems undebatable. The men are happier, take more pride in their work and in the appearance of the shop, and generally do better all around when the light is good. It also undoubtedly has its effect on keeping labor turnover from going higher. It is very doubtful if a few cents more wages will tempt skilled men from a plant that is well lighted to one that is poorly lighted.

PRODUCTION INCREASED AND SPOILAGE REDUCED

There seemed to be a unanimity of opinion regarding the part good light plays in increased production, although there were no figures to substantiate the opinion. However, it had been noticed in many plants that the men start work more promptly in the mornings and work up nearer to quitting time. Less loafing has been noticed in plants that have installed better artificial lighting. As one manufacturer put it, "A poorly lighted mill makes the men sleepy and production suffers." One or two others instanced men going to sleep in dark places where the lighting was poor. In each case, however, this practice was eliminated by the installation of a better lighting system.

Spoilage and repairs are elements to be considered in any production program. The reduction of the former has a twofold significance to-day. It reduces production and also reduces the available amount of raw materials. Anything, therefore, which tends to lessen spoilage has a place in the war program.

Manufacturers seem unanimous in expressing their convictions that better artificial lighting means less spoilage. A statement from a copper mill is to the effect that good lighting "is a necessity in cutting out excessive waste of copper through the tails." A manufacturer of glazed kid states that better lighting has "lessened to a considerable amount the number of mistakes."

Another angle is brought out by the general manager of a rubber plant who states that good lighting "helps the inspection department to throw out more bad pieces which otherwise would get shipped to customers to send back." The other side of this situation is, of course, the lessening of the burden on transportation systems by just so much.

A manufacturer of motors points out that good lighting reduces spoilage very much where the workman is working to micrometer dimensions.

A sugar-mill operator states that "good lighting reduces spoilage to a minimum in our case. It used to be quite a frequent occurrence to add cane juice to the ocean brine because of the overfilling and consequent overflowing of juice tanks, a thing that has been reduced through better lighting to practically nothing. The splashing and spilling of the massecuite about the centrifugal driers has been reduced to a minimum, thus making for less spoilage and a cleaner plant. While exact figures of the saving thus brought about cannot be given, it is safe to say that the saving pays for the whole lighting system in one season. The saving in lubricants due to the reduction of spillage amounts to 25 per cent."

A tire manufacturer states that unless lighting for inspection is of the best tires that should be rejected for defects are passed up.

In a number of cases the value of good lighting in making repairs was mentioned. Mention was also made of the fact that good lighting made it possible to catch irregularities in a machine operation sooner than would otherwise be the case.

There is a unanimity of opinion therefore among manufacturers on the value of good artificial lighting. That it is playing a by no means insignificant rôle in winning the war is evident. The results of better lighting can be seen in increased output, fewer accidents, reduced spoilage and steadier labor.

Women's Place in the Electrical Industry

They Already Play an Important Part in the Production of Electrical Apparatus and Are Gradually Being Employed in Central-Station Work

FOURTEEN months ago almost to a day the United States entered the great world war. In that short time American industry has come to experience many radical changes. The change of greatest importance perhaps, because of the influence that it will have on human progress long after the war is over, is the utilization of that which is at hand in place of that curtailed or shut off by the war. Substitutes have been found that frequently give better results than the materials formerly employed.

Not only has substitution been made use of in the matter of raw materials but also in the labor that fabricates these raw materials into the finished product. The draft and the enlistments into the army and navy and other government work have taken millions of men out of regular employment. Industries new to this nation, such as shipbuilding and munitions manufacture, have drawn on the labor supply for hundreds of thousands of others. In addition, conditions brought about by the war have caused the manufacturing plants to increase considerably in number, facilities for production and output.

The demands of the war and of industry have therefore placed an unprecedented strain on the labor supply. Nor could this strain be relieved by the importation of labor from abroad. The war had virtually shut off our former supply of unskilled immigrant labor. Europe, however, with its experience gained through the three years of war prior to the entrance of the United States into the conflict had found a solution—woman. While the employment of women in industry was no new idea to American business men—history shows that women were employed in winding magnets as early as 1862 and that the Western Electric Company began employing women for coil winding in 1873—still industrial managers were reluctant to introduce women into factories on work formerly done by men. This has been in spite of the published records of English

producers showing the quantity and quality of woman's work.

Nevertheless, the problem of a deficiency of male labor faces the nation. As the war progresses this situation naturally will become more acute. The government through its most recent draft proclamation of "work or fight" recognizes the need for more men in industry. This is the true situation in spite of frequent statements emanating from organized labor that there is no scarcity of male labor.

Recognizing that an insufficiency of male labor does exist and that as a result female labor must be substituted more and more, a representative of the *ELECTRICAL WORLD* has in the past two months made a personal investigation of the employment of women in a number of electrical manufacturing establishments. This study has been made in order that the entire industry might have an analysis of the experience of the plants visited.

While it was manifestly impossible to visit every electrical manufacturing organization, nevertheless, the products of the factories in which the investigation took place represent almost the entire line of electrical materials now on the market. The products include motors, generators, transformers, control apparatus, meters and instruments, fans, lamps, wire and cable, insulation of many kinds, molded and porcelain insulators, storage batteries, ball bearings, turbines, all kinds of wiring devices, high and low tension protective equipment, lamp guards, switch boxes, panelboards and other standard electrical equipment.

In much of this work, of course, women have practically always been employed. Lamp manufacture, for instance, employs, roughly speaking, 80 per cent female labor. Coil winding has largely been done for years by women. A considerable part of meter manufacture and assembly has been done by women, although the last few months has seen more of the operation in

NUMBERS OF WOMEN ARE NOW EMPLOYED IN THE MANUFACTURE OF ELECTRICAL GOODS

Reading left to right, the pictures show the following operations: Winding rheostat coils; motor-coil winding; armature winding; meter armature winding; testing meters; lacquering switch parts; knife-switch assembly;

mica building; wire braiding; making field coils; tapping. In all of these operations women are doing satisfactory service, and their field of employment continues to grow.

meter manufacture done by women than formerly. Much of the small work in wiring device fabrication has been done by women.

HOW EMPLOYMENT OF WOMEN IS GROWING

Since about September last, when the first draft was called, all of the plants visited, with two exceptions, have begun in a small way, increasing gradually, to employ women in what was formerly considered as man's work. In one of the exceptions the management of the plant, being unwilling to employ women, turned in its necessity to old men—men who formerly, because of their years and infirmities, would have no place in factory production. The results in this case have been very gratifying to the management of the plant.

In very few cases have women been employed to take the places left vacant by experienced men. In the majority of cases women have replaced young men and boys. In many instances employers said that they had had this change in mind for a long time and that the war simply hastened their action. Much of the work is described as really woman's work—it is small, light and of quantity nature and by no means physically fatiguing.

Women have replaced male labor at the present time for the sole reason that it was impossible to obtain male labor in sufficient quantities and at the wages offered. The writer has one instance in mind where a boy yet to have his first shave entered the employment department of a New Jersey factory looking for work. Asked what he had been getting, he said \$32 a week. This is but one instance. Boys of sixteen and seventeen are now demanding and getting from \$18 a week up. There is sufficient labor applying for work, but in large measure it is either undesirable or else of the floating kind looking for higher and exorbitant wages.

Women of all kinds are applying for work. They are being drawn from other industries, from the servant class, and to a slight extent from the store and office. A large number of teachers are entering factories because of the wage inducement. The home also is furnishing a number of women. Girls who never worked before are now seeking employment. In many cases some male member of the family has gone to war and the girls have of necessity had to go to work. There are a number of married women whose husbands are in the army or navy who are seeking employment. Finally there are large numbers of girls going into factories whose father or mother or some friend works in one and urges them to do so.

HIGH TYPE OF WOMAN ENTERING INDUSTRY

Generally speaking, the type of girl going into industry is a high type. Many have been impelled to this action through patriotic motives—the wish to do their bit. There are instances, however, where the general average of women seeking industrial employment has been lower. In each case where this condition was met a study was made of the locality and the labor competition in that district. Without exception it was found that where the average type was lower industry had already drawn heavily on the female labor supply and that the cream had long been absorbed. Now, with still greater need for female labor, it is but natural that a lower average type is being accepted. When

so many industries are bidding for a certain class of labor it is not possible to pick and choose as formerly.

On the other hand, in districts where there was little or no competition the type of girls coming into industry now is as a rule somewhat better than formerly. It probably can safely be said that in districts where there are a number of plants engaged in the manufacture of munitions in which women are employed at very attractive wages the general average of women seeking industrial employment will be lower. Where this condition does not exist the average will probably be higher.

Employers speak well of the quality and quantity of woman's work, and not a few express their surprise that such good results could be accomplished in such a short time. In those factories visited they have been found, on whatever work employed, to be fully as efficient as boys and frequently more so. As a rule, the women do not have so large an output as grown men.

WOMEN MORE DEPENDABLE THAN BOYS

Women are more punctual and steadier than boys. They do not loaf so much on the work. The tendency of women to absent themselves from work, which has been so prevalent in offices and stores where a regular weekly wage is paid, has been regulated in the factory without difficulty through the time or piece rate system of compensation.

It is generally felt by those employing women that they must be placed on light work only. The best results with women so far have been obtained on light work and quantity production. While it is generally believed that women to be of any use should do the same thing day in and day out, there are instances where girls are running two or three different kinds of machines interchangeably as needed. In only exceptional cases do the women set up their own machines or grind their own tools. Helpers are employed for this work. Girls are not inquisitive about their machines. In some ways this has proved advantageous, for boys with an inquisitive turn of mind have caused considerable damage to valuable machinery.

OLD IDEAS OF PHYSICAL ABILITY ARE CHANGING

Some of the old ideas regarding the physical limit to woman's work are now giving ground under the stress of conditions. Women are being put on work to-day that two years ago factory superintendents would have thought to be too heavy. They are winding heavier coils and running machines that need greater exertion. In every case investigated the results justified the action.

There is one point made by most factory superintendents that is borne out by European experience. That is the matter of training. Superintendents and foremen hold that for women to be a success in the factory the training must be very careful and thorough. Women, it is claimed, will not use their heads on factory work. They will simply do as they are taught. If well taught, their work will be well done. Production will be greater and better in direct proportion to the exactness of the training. Sufficient time therefore must be allowed and the instructors must be competent and patient. They must understand women and be able to bring out the most in them.

Some trouble was expected by employers from male

labor, because of the introduction of women. None, however, has developed in those plants visited. The men appreciate the fact that there is a shortage of labor and that the employment of women was a necessary measure. In most factories the men are very kind to the female operatives and go out of their way to help them.

While the wages in almost every case are lower than those received by the replaced males, there has been no complaint so far from organized labor. However, this wage matter will probably adjust itself before the conclusion of the war. Women are already making demands, and employers fully expect in the long run to have to pay equal wages for equal work.

As regards turnover, the same condition exists as was spoken of in connection with the type of women employed. Where there is little competition the female

turnover is very small as compared with the male. Where there is competition, especially from plants engaged on war contracts, the female turnover is as great as, and in some instances more than, that for men. The turnover resulting from marriage is not so large as might be expected.

Women have been employed as a war measure not only in manufacturing but also in other branches of the industry. A number of central stations are known to be experimenting with them in different positions formerly occupied by men. In the meter, billing and collection and in the sales departments particularly women are being tried out.

In subsequent issues of the ELECTRICAL WORLD this subject will be gone into in more detail with special reference to instruction, welfare work, wages, factory changes involved, turnover and legislation.

Central-Station Employee Relations

Faithfulness of Employees During War-Time Stress Due to Foresight Displayed by Managements in Establishing Welfare Work Years Ago—Accident Insurance and Profit Sharing Play Their Part

BY FRANK A. FARNSWORTH, JR.

THE fact is more urgent than novel in any sense that the present is a time of increasing uncertainty in the labor field. The war, with its tremendous claims on overseas interest, has, so far from drawing attention from problems at home, been a means, and a potent means, of bringing this labor question more sharply to the fore. So true is this that consistently with patriotic ends the question undoubtedly is uppermost in the minds of industrial leaders the country over.

While the central-station industry, with its far-reaching ramifications, lays no claim to great foresight in this direction, it can safely include itself among the number that have foreseen to some degree and acted accordingly. The co-operative idea to which reference is made has worked out in this case successfully and with growing momentum, assuming one aspect here and another there, as local conditions determined, but everywhere instilling collective confidence that has reacted in industrial strength and steadiness.

It has long been felt in central-station circles that any suggestion of charity or philanthropy should be avoided in the establishment of relations between employees and their employers. On the contrary, a man-to-man attitude has been in force, in the sense that the employee shall earn his compensation both in the performing of work and in the rendering of service. This last presupposes, of course, continuity of work, together with a degree of devotion that affects not only his own efforts but the tasks of those about him. To insure this devotion and continuity the industry, especially during the last decade, has adopted a series of measures each of which will be described briefly.

INSURANCE AGAINST ACCIDENTS

Second to no other in importance in this series is the insurance of employees against accident, together

with the use of every known device for accident prevention. It has been the belief in the industry that the cost of all industrial accidents due to other than deliberate misconduct or gross carelessness should be borne by the employer, who, moreover, assumes full responsibility for the rapid restoring to health of the injured employee. His wages are continued during the interval, and the cost of all medical treatment is met by the company. Should a man be partially incapacitated for life he is put to work at some duty suited to his competence. These and other provisions in the same spirit have been applied throughout the industry as a whole, and needless to say have done incalculably much to foster reliance in one's company and devotion to its interests. Such methods were effective, for example, in the New York Edison Company long before local industrial conditions called for the passage of the workman's compensation act. While compelled to readjust its practice to conform to this act, the New York Edison Company has since contented itself with nothing less than making up the difference to the employee between the compensation prescribed by law and the full compensation paid him before its passage, provided that the employee conscientiously follows out the instructions of the company's physicians.

With regard to accident prevention, the same company has adopted a course thoroughly typical of the industry in general. To such an extent has the protective sheathing of parts been carried in the New York stations that the probability of accidents is reduced to a minimum. Not only do voltage numbers, "hold off" signs and other such announcements confront the employee at every turn, but when work is to be done in installing or in connection with high-tension apparatus the issuing of notices, the preparing of sketches and the making of records at each single step preclude trouble all but absolutely. Systematic inspection

TYPES OF EMPLOYEE HOMES BOUGHT THROUGH THE NEW YORK EDISON SAVINGS AND LOAN ASSOCIATION

tion and the providing of hand rails, rubber mats and rubber gloves are effectively seconded by the distribution of operating rules with which every man is required to familiarize himself. By way of a final safeguard, and one perhaps as essential as all the others, the company in question maintains a technical school for employees which aims not only at the imparting of technical skill but at the development of mental alertness and accuracy of judgment. Such means taken for his protection have not failed to promote

in the employee both a confidence in his surroundings and a trust in the organization of which he is a part.

While accidents at times occur despite every precaution humanly possible, industrial sickness as commonly known is practically absent. However, ordinary sickness applies here as elsewhere and has offered a further scope for co-operative interest. With this in view, benefit associations have in general been established throughout the industry. Aided by the em-

ploying company, these have followed a successful and practical development. Owing to such means, the old custom among employees of "passing the hat" whenever it was necessary to raise money for the funeral expenses of a fellow employee or when his dependents were left without means has been done away with. The general opinion has prevailed that with the assistance of the employing company these co-operative societies can contribute approximately 50 per cent of the wages of an employee when sick at a cost of approximately 1 per cent of his wages; furthermore, that a death benefit of from \$300 to \$500 can be paid with a weekly contribution ranging from 10 cents to 15 cents.

Among many such associations in the industry that of the Southern California Edison Company is the

tions in general, and the age prescribed for the receiving of an annuity on a basis of permanent service is, roughly speaking, sixty-five years for a male employee and sixty years for a female employee. The term of continuous service in the organization is approximately ten years. The cost of such annuities is contributed by the individual company as part of the annual cost of labor. Obligation to pay the annuity ceases only in the event of the employee's breaking voluntarily the continuity of the term. This naturally does not apply in case the employee is laid off temporarily through no fault of his own. A break of this sort is looked upon rather as an interruption. Such, broadly speaking, are the pivotal considerations on which the plan rests and on which it has succeeded in helping labor to rely in the central-station industry.

EMPLOYEES ARE OBLIGED TO USE RUBBER GLOVES, SWITCH GUARDS, ELECTROSCOPES AND OTHER SAFETY APPLIANCES PROVIDED BY THE COMPANY

most recent to be reported. This company, it seems, has volunteered to collect the assessments through its payrolls, turning the amount so collected over to the treasurer of the fund, and also to advance money to the fund in case a loss has to be paid before the assessment can be collected. The average cost of the amount of insurance agreed upon has been a little less than 44 cents a month and compares favorably with any class of insurance obtainable anywhere. The fact that no item of expense of any sort is charged against the fund makes it possible to give the beneficiary every cent contributed. It has further been an unwritten law to pay benefits with the utmost promptness. What this particular fund is doing in removing the distractions of worry and necessity is reflected in many similar associations in as many companies under whose patronage and with whose help such benefits are made possible.

SERVICE ANNUITIES

An exceedingly forceful factor in the advancement of confidence and loyalty is the provision of service annuities. The practice prevails among central sta-

The service annuity plan of the Edison Electric Illuminating Company of Boston illustrates a concrete working out of the idea. This plan specifies that "any male employee who shall have reached the age of sixty-five years and who shall have completed fifteen or more years of continuous active service (the age for female employees is sixty years) shall at his or her request or at the discretion of the committee be retired from active service with a service annuity." The Boston plan goes on to provide that "any male employee who shall have reached the age of sixty years and who shall have completed twenty or more years of continuous active service (the age for female employees is fifty-five years) shall at the discretion of said committee be retired from active service with a service annuity." Any employee who shall have completed thirty or more years of such service can, under this arrangement and irrespective of age, be retired at the committee's discretion with an annuity.

The amount of this annuity to be paid each year is 1 per cent of the average annual pay of the employee during the last ten years of active service multiplied by the number of years of service. It is provided,

however, that no service annuity shall be less than \$300 a year. With this surety ahead of him the employee cannot but feel at home and secure as a central-station man.

SHARING PROFITS WITH EMPLOYEES

What the Southern California Edison Company has adopted in the way of profit sharing may be cited briefly as showing what a prosperous unit of the industry is doing to promote in this way the cohesion of capital and labor. The cardinal features of the plan are as follows: On due authorization the company last August issued \$2,500,000 of its common capital stock, and all employees were given an opportunity to subscribe under carefully worked-out conditions. These conditions were as easy as consistent with conservative financing, and permitted an employee to subscribe for shares of par value equal to not more than ten times his monthly salary. Such subscriptions are paid for by deductions from monthly pay checks of a sum equal to $7\frac{1}{2}$ per cent of the past month's salary and credited to the purchase price of the stock. Subscribers are also credited with all dividends which accrue from the date of subscription, and these dividends apply as payments on account of the profit sharer's stock together with the $7\frac{1}{2}$ per cent deducted from his salary. When payments have been completed stock certificates are issued, and thereafter checks are mailed to stockholders as dividends are declared. If they wish, profit sharers of course can pay as much more as they desire upon their stock, the $7\frac{1}{2}$ per cent having merely been decided upon as the limit of deduction. At the price which the stock was and is bringing to employees, the interest is equal to practically 8 per cent, or more than double what can be obtained from savings deposited in any sound institution. After a trial of six months this plan has amply justified its inception. It may be said, in fact, that a general plan of this nature advocating profit sharing through the ownership of stock on the part of the employees has become an all but prevailing policy in the industry.

A still further provision whereby the central-station employee is drawn sympathetically to the industry and markedly to his immediate organization—a provision looking to confidence in the concrete and economic sense—is that of the savings fund. The idea, which was included some years ago as part of the industry's public policy, aims to encourage thrift among employees, not alone as a resource in emergency but even to the degree of home ownership. The two outstanding features in the general project were and are a guarantee by the company of the security and safe return of the funds and the affording to employees of every convenience in making their deposits. Under the conditions it was felt that more than the ordinary savings-bank rate of interest could usually be paid.

Though the savings association of the New York Edison Company may possibly not be more effective in its field than similar associations in central-station companies in many parts of the country, special reference may be made to it here inasmuch as the very latest figures are at hand. This association was started in 1912 and within five years had distributed to its membership \$69,554 in dividends. This item alone for the past year amounted to \$26,962, while the

money deposited in the same year aggregated \$285,882. The smallest deposits have been acceptable, and the way has been made easy for every member of the company to save something, however little. By way of illustrating share earning, mention may be made of the first installment series, of June, 1912. The dues paid on a share in this series amount to \$67, and these in turn have earned \$12.83 in dividends, bringing the present value of the share to \$79.83. To continue through the list would be to meet at every point results emphasizing the benefits of such membership.

A word has already been said regarding the desire to make employees a home-owning class. With this in view, bond and mortgage activity has marked the association from the start. During the past year this activity has brought about total loans numbering 129, with a value of \$392,000.

Installment mortgages can be carried for \$10 monthly on each thousand dollars loaned—half of the charge, or the portion representing dues paid, operating continuously toward the reduction of the principal sum. These loans may be made either for the purchase or building of homes, for the transfer of existing mortgages or for home improvements. In every instance the association stands ready to render the greatest aid with respect both to the loan itself and to the preliminary details. In the case at least of this association all expense of operation is borne by the company. That the expense involved in clerical work is in itself a very considerable item and one that otherwise would appreciably reduce the dividends now possible is seen in the one fact that 80 per cent of the members pay their dues in weekly installments.

With figures immediately available, mention may be made in this connection of a highly popular and successful insurance privilege of which four-fifths of the employees of this company have availed themselves. The type of insurance offered is what is known as the "group term," the amount of the primary offer being \$250, to which \$100 is added gratuitously by the company in case of death. The fee under this plan is 65 cents a quarter, or 5 cents a week. Policies more substantial in amount up to \$1,000 may be taken out by any employee without physical examination, provided he does so within one year after his entering the organization. The policies in this case may be of any sort a man may care to take, and the fees are at the regular standard rate.

THE SOCIAL SIDE OF WELFARE

Much might be said, and of a most interesting description, regarding other helps which the various companies in the central-station industry afford their employees, with emphasis particularly on the social side. Indeed, any discussion of employee clubs and clubhouses would require an article of itself. However, enough perhaps has already been pointed out to show that exceedingly much has been done by the industry to infuse the human element into its employee relations and eliminate unfortunate infelicities and misunderstandings that stand in the way of cohesive co-operation. This infusion and this elimination, which have so long been the aim of those who have sought and striven for happier conditions for their fellow men, may in truth be said to be realized in this industry and stand out even in these troublous times.

Avoiding a Preventable Loss

Soot and Its Effect on Heat Transfer Through Boiler-Heating Surface — Relative Steam Consumption of Mechanically Operated Soot Blowers Versus Hand Cleaning — Effect on Coal Pile, Labor and Maintenance Cost

DURING recent years the boiler room has gradually emerged from a position of secondary importance to a primary element in the cost of power generation. Boilers have been growing in size, combustion rates have increased, and greater loads per unit of steam-making surface are being carried. With the operating conditions becoming more severe and fuel cost high above the normal level of years past, closer scrutiny is being given to all factors affecting economy.

LOSS FROM SOOT FORMATION

Of all the preventable losses, that caused by the formation of soot on the fire surfaces of the boiler is perhaps the most troublesome. Cracks in the setting may be detected and the leakage of air into the setting may be stopped. Proper insulation will reduce radiation, and scale on the water surfaces may be eliminated to a large extent by the use of pure or softened water. The formation of soot and ash, however, is universal and continuous as long as there is an active fire under the boiler. Depending upon the degree of combustion and arrangement of the setting, the quantity of soot varies and its character differs with the fuel, but there is no stopping of its formation. Even if conditions were ideal and combustion complete, a heat-insulating coating composed largely of ash would form on the tube surface.

As a rule the soot found in boilers is not pure soot or carbon. It contains a varying proportion of ash, so that the color may be light gray, red, brown or black where conditions are particularly unfavorable to good combustion. In coming from the furnace the soot particles are more or less plastic and readily adhere to the metal surface of the tubes. Unless the deposit is quickly removed the carbon on the tubes near the fire will burn out in part, fusing the various ingredients into a hard coating which increases rapidly as the gas temperature rises because of the insulation of the tubes. In water-tube boilers it is not uncommon to find on the heating surface near the fire hard clinker-like formation, in some cases bridging the tubes. Even with efficient and frequent cleaning it is practically impossible to keep the lower tubes near the fire entirely free of this slag-like formation. Further back the soot does not contain so large a percentage of ash. It is usually darker in color and the formation is not cemented together. Loose deposits rest on all retaining surfaces, such as the upper portions of the tubes.

With all kinds of fuel, then, there is formation of soot. Anthracite contains a low percentage of volatile matter, but may run high in ash, so that the deposit is largely the latter constituent and is usually of a light powdery character. With bituminous coal, high in both volatile and ash, there is a large percentage of carbon in the soot, particularly if the furnace conditions are not favorable to good combustion. In waste-heat boilers deposits of fine powdered dust carried along with

the gas are to be found, and even with oil fuel there is some formation of soot. Owing to excellent combustion the quantity is small, but as the deposit is pure soot of high insulating value, its removal is important from an efficiency standpoint. The soot evil also extends to the economizer, the deposits resembling the boiler soots. Because of the lower temperatures the formation is more profuse and its interference with heat transmission relatively greater as the difference in temperature between gas and water is less.

It has been commonly stated that next to loose wool loose lampblack or soot is the best insulator known. In this respect it is ahead of hair felt and is more than five times as effective as fine asbestos. All this may be true, but boiler soot is not all lampblack. The varying percentages of ash and the density and structure of the deposit will naturally affect the insulating properties. Besides, the coating is not evenly distributed, so that part of the surface at least will be comparatively clean. If the maximum heat transfer through the boiler tubes is to be maintained, however, all of the heating surface must be kept clean, and this is particularly true where boilers are forced over normal rating, as is the practice in modern plants. If the soot is allowed to remain, another bad feature is the formation of carbonic and sulphuric acids, which act on the metal of the boiler, causing leaky tubes and general deterioration that will shorten the useful life of the boiler. It is quite evident, then, that soot must be removed if the best results are to be obtained, and the question at issue is the easiest and most efficient method of doing this.

METHODS OF REMOVING SOOT

For this purpose there are the hand lance and the mechanical blower. The former, consisting of a rubber hose and nozzle, was the first device to be used. It is, of course, very simple, and the initial cost is small. Two men are required to operate it—one at the boiler to handle the nozzle and the other at the steam valve. The work is naturally hot, dirty and disagreeable, and on a medium-sized boiler it takes from twenty to thirty minutes. Usually there are not more than one or at most two blowings per day of twenty-four hours. The lance is inserted through dusting doors in the setting, and there is no opportunity for the operator to see the result of his work. Unless he is conscientious beyond the average the surface may be poorly cleaned and some sections be neglected entirely. Usually the lance does not reach all of the heating surface, the area covered being determined by the kind of dusting doors, the width of alley space at the side of the boiler and the range of the lance due to the angle of the dusting door. Another objection commonly advanced against hand blowing is the fact that when soot is blown across the tops of the tubes it strikes the battery wall and tends to pile upon the far tubes, contrary to the argument that the draft will carry it off.

Moreover, there is the additional objection of large quantities of cold air being drawn into the setting during the period the steam lance is in operation. This means less efficient combustion.

Labor is another item entering into the comparison. The mechanical blower requires but one man, and the time of blowing is, say, one-fourth as long, so that the

FIG. 1—STEAM CONSUMPTION WITH HAND LANCE

ratio is eight to one. With very large boilers it may be considerably higher. Local conditions, size of plant, etc., determine whether the saving in time will be sufficient to dispense with the services of employees retained for this work.

Objections offered to the mechanical blower are initial cost, running from 5 to 10 per cent of the cost of the boiler, the burning out of the elements exposed to the hottest gases direct from the furnace, and warping. The objection last named, warping, has always been a serious problem. It is a well-known fact that metal begins to warp long before it reaches a temperature that will cause corrosion or burning of the metal. For that reason it is necessary to construct the element so that it will have strength to resist the warping; for as soon as this action begins the element will be thrown out of line, it will bind in the bearings and the operator will be unable to turn it.

The initial cost is comparatively small when compared to a 5 per cent saving in the fuel bill, the reduction in labor and the convenience of operation. Destruction of the elements near the fire has been obviated to some extent by the use of special metal having high heat-resisting qualities and by so placing the elements that they are protected from the direct heat of the furnace when in the non-operating position. Corrosion, due to back suction of the boiler gases into the blowing elements, has been reduced by the use of special air valves, and special precautions have been taken to drain the piping system of the blower to prevent condensation being forced out onto the heating surface to interfere with soot removal and to corrode the metal. These various improvements, better placing of the elements and nozzles of improved design have so perfected the mechanical blower that, according to reports from numerous users, the services rendered are excellent and the maintenance charges are comparatively small.

While users of the mechanical soot blowers realize that they are getting better heat transfer, that the flue gases are lower in temperature and that the boiler efficiency has been improved, there is a lamentable lack of specific data showing the saving actually effected and the average cost of maintenance. The blowers have

been installed. They are giving satisfaction. The boilers will carry more load, and it is known that the flue temperatures are considerably lower than previous to the installation. During the first two or three years of use repair parts are required occasionally. Depending upon the service, the average life of the blower is at least five or six years. The labor of blowing has been reduced, and as the work is less arduous, it is performed more frequently and with better results.

Such was the gist of replies from a large number of power-plant owners and engineers to whom inquiries had been sent by the ELECTRICAL WORLD concerning the saving in fuel and labor effected by the installation of mechanical blowers, the cost of maintenance and the degree of satisfaction the blowers gave in service. The substance of some of the replies, more specific than others, is presented in the following:

The Iowa Falls Electric Company has equipped three Edge Moor water-tube boilers of the four-pass type with soot blowers. Two of the boilers were rated at 410 hp. and the other at 550 hp. The boilers had previously been blown by hand, and the work required the full time of one man at a cost of \$850 per year. In the company's opinion it took a remarkably good man to stand up beside a hot boiler and blow every tube. Frequently some of the tubes were missed, and the result was a reduction in efficiency. Besides, a man could not hold a hose carrying 175-lb. (12.3 kg. per sq. cm.) steam pressure. It had taken the company two months to get all of the old scale off the tubes caused by blowing them with wet, low-pressure steam. The principal advantage of the mechanical blower in its estimation was the fact that full boiler pressure could be used and that better results were obtained. Since the installation of the blowers the services of the man previously mentioned had been dispensed with, and the firemen were blowing the tubes twice on every shift. The saving in coal was placed at 15 per cent. The blowers had been in service one year, and the maintenance expense had been the cost of 1 pint (0.47 l.) of oil to lubricate the swing joints.

The Iowa Railway & Light Company of Cedar Rapids

FIG. 2—TOTAL STEAM REQUIRED FOR PERIOD BLOWER IS IN OPERATION

had installed mechanical soot blowers on twenty-nine Edge Moor water-tube boilers during a period extending from 1909 to 1918. The company knew that the blowers were a great help both in labor and economy, but could give no definite figures. It had been found that the blowers would not keep clinkers off the first row of tubes. Here was a chance for improvement.

In the plant of the Indianapolis Light & Heat Company fourteen boilers, ranging in size from 500 hp. to 800 hp., were equipped with mechanical blowers. If properly operated, the blowers saved approximately 15 per cent in fuel and labor. About $12\frac{1}{2}$ per cent of this saving was attributed to higher boiler efficiency and $2\frac{1}{2}$ per cent to a reduction in labor cost. The maintenance had been approximately \$5 per installation per month.

The Richmond Light & Railroad Company had blowers on ten 606-hp. B. & W. boilers, equipped with Taylor stokers. The maintenance on the blowers, which had been installed from one to two years, had been practically nothing. The company had no accurate data to show the saving in coal and labor, but was satisfied that the blowers were a good investment.

The Edison Electric Illuminating Company of Brooklyn had in use blowers on seventeen B. & W. boilers averaging 650 hp., and forty-five additional units were being installed. Installation work had begun in November, 1916, and no definite figures as to fuel saving are available, as the majority of the boilers were

FIG. 3—STEAM CONSUMPTION OF 2-IN. BLOWER FOR VARIOUS PRESSURES

still blown by hand. In the opinion of the operating engineer there was no question that the boilers were much cleaner by the use of the mechanical soot blower, and as a result a saving in fuel must result. When all of the soot blowers were installed, the labor saving would eliminate the services of five men and would amount to about \$13 per day.

Soot blowers on 4900 hp. of Stirling boilers are in use at the plant of the Indiana Railways & Light Company of Kokomo, Ind. No tests have been made to determine the percentage of saving. Cleaner tubes so clearly indicated a saving that the question had not been analyzed. It had been their experience that the soot blower complete had to be removed in from five to six years.

Four 750-hp. Bigelow-Hornsby boilers in the plant of the Salem Electric Lighting Company of Salem, Mass., had been equipped with soot blowers in 1915; five blowers were installed on 280-hp. Heine boilers in the plant of the Rockland Light & Power Company of Nyack, N. Y., in 1914, and in the same year a 600-hp. B. & W. boiler of the Malden Electric Company of Malden, Mass., was equipped with a blower. In the plant first mentioned the saving in labor was \$675 per year, in the second plant \$411 per year, and in the Malden plant the labor saving was undetermined. Blower repairs in the three plants had been negligible. In the opinion of the engineering manager controlling the three prop-

erties there was no question that there had been a saving in fuel on all the boilers equipped with mechanical soot blowers, as it was possible to clean the tubes twice in twenty-four hours so that the heating surface was maintained in much better condition. No exact data were available.

The Central Hudson Gas & Electric Company of Poughkeepsie, N. Y., had equipped six of eight Stirling boilers with mechanical blowers. These blowers were much more effective than the compressed air they had previously used, and there was a considerable reduction in labor.

Installation of soot blowers on two 400-hp. Heine water-tube boilers in the plant of the Chester Valley Electric Company of Coatesville, Pa., in the year 1911 had resulted in a saving in the operation of the plant roughly estimated at 5 per cent. The above figure was considered conservative and was divided into 1 per cent in labor and 4 per cent in fuel. The maintenance charges, which had been small, were placed at \$100 in seven years.

With blower installations on two 350-hp. Heine boilers and two Stirling boilers for several years, the Texas Power & Light Company placed the cost of upkeep at \$5 per blower per year. A saving in fuel of approximately 10 per cent was estimated over hand blowing.

The public lighting plant of the city of Detroit had installed soot blowers on two 685-hp. Stirling boilers on April 21, 1916. To clean the soot from two 400-hp. Stirling boilers by means of a steam hose from ladders required the labor of two men for about three hours. With the mechanical blowers the battery of two 685-hp. boilers was cleaned by one man in one-half hour, the ratio being twelve to one in favor of the mechanical blower. So far there has been no maintenance expense.

One of the large central-station companies of the country has equipped fifty-five boilers with mechanical soot blowers. These blowers are of competitive types, and a few of home manufacture. Fifteen of the installations have been made on Stirling boilers rated at 2365 hp., that operate between bank and about 200 per cent of rating. On overload the temperatures are high and the conditions severe, so that it has been found necessary to assist in the further development of the blowers. To clean one of the large boilers by hand requires twelve to fourteen hours' time with two men operating. These men receive 38 cents per hour, so that the labor cost for hand blowing averages about twenty-six hours of 38-cent time, or just under \$10 per 2500 boiler-hp. per twenty-four hours.

With soot blowers installed two men blow a boiler in about one hour. They blow each boiler three times per day, so that the total labor cost approximates \$2.30 per 2500 boiler-hp. per twenty-four hours. Thus the labor item is reduced to less than one-fourth, and the boiler has the advantage of three cleanings per day. The job is much better done, and no useless air is admitted through open doors. The effect of this factor will be appreciated when it is noticed that it takes from twelve to fourteen hours to blow one of the boilers by hand.

To clean one of the big boilers with a mechanical blower requires about 3500 lb. of steam per blow. Three operations per day would require about 10,500 lb. (4762.7 kg.) of steam per 2500 boiler-hp. every twenty-four hours.

The maintenance charges on soot blowers had not been separated from certain other somewhat similar costs, but it was estimated that soot blowers properly installed could be kept in good operating condition with a maintenance expenditure of not over \$200 per 2500 boiler-hp. per year. The average charge had been higher than this, but it was due to the fact that certain parts as originally designed and installed had given out frequently and had to be replaced. Owing to imperfect methods used for measuring flue-gas temperatures accurate data were not available to indicate the thermal advantage obtained from the use of soot blowers. It was believed safe to assume, however, that mechanical soot blowing maintained a flue-gas temperature about 30 deg. to 40 deg. lower than could be maintained with hand blowing, and unless the latter operation was completely and conscientiously done, the difference would be more nearly 80 deg. to 100 deg. less.

PRACTICAL SUGGESTIONS FOR ECONOMY IN USE OF FUEL

By Using High-Grade Coal at Peak Time Poorer Coal
Can Be Utilized at Other Periods Without
Increasing Boiler-Room Investment

BY P. B. JUHNKE

Chief Load Dispatcher Commonwealth Edison Company

THE ever-increasing fuel requirements of this country entailed by the immensely increased industrial requirements focus the engineer's attention on a subject not generally considered heretofore. It is the burning of lower-grade fuels without greatly increasing the boiler-room investment.

The steaming value of a given coal is within certain well-defined limits a function of the size of the coal; likewise, the price of coal is dependent on the size selected, screenings being rated lowest in value. While their test B.t.u. value may be equivalent to that of any given coal, their steaming value in boiler rooms is considerably lower than similar screened coal. However, as screenings will always be a necessary by-product in the coal industry and as 90 per cent of the time they are sufficient, they constitute the logical fuel for central stations.

Burning the lower grade of fuel exclusively, however, requires additional boiler-room equipment over what would be required with the more expensive screened coal for a given steaming capacity. The additional investment required is vitally important to central-station companies, whose loads have the familiar sharp peaks, during which time alone the development of maximum capacity is necessary.

A decided step in the direction of economy of both boiler-room investment and high-grade fuel has been made by the Commonwealth Edison Company in its principal generating stations during several peak seasons. The fuel ordinarily burned is not quite sufficient for the development of maximum capacity during the winter evening peaks, and is supplemented in these periods by higher-grade fuel, to permit maximum output. This is done by storing the more suitable coal on the floor and during the peak supplementing the stoker firing of lower-grade fuel by hand firing of the higher-grade fuel in the proportion of approximately fifty-fifty. Such practice permits good combustion of the

entire supply and enables the stations to carry their rated full load and more at the most critical time of the daily load, something that would be scarcely possible were the hand firing of high-grade coal not resorted to.

This scheme of developing full load, however, is not altogether free of objections. First, it requires that a large amount of coal be stored on the boiler-room floor, a poor place for coal according to modern conceptions. Second, it requires a large amount of help to store and shovel the coal into the stoker, and this help may be difficult to obtain and is quite expensive.

To overcome these difficulties a scheme has been adopted at the Fisk Street station which has proved quite satisfactory. High-grade coal is kept in one bunker out of every group of sixteen, and the corresponding boiler is kept banked at all times except during peak loads. A traveling bucket movable by a crane is filled from this bunker to supply high-grade fuel to any other hopper requiring it. This arrangement has reduced the labor expense considerably.

Despite the aforesaid difficulties connected with this method of supplementing low-grade with high-grade coal when required, the underlying principle seems good enough to demand special consideration from designers who look to the fuel situation ahead. Provision for auxiliary high-grade coal bunkers that will be large enough to meet the increased demands during peak periods has been made in a few stations, but it might be advisable for all future stations. The capacities of such bunkers need hardly exceed 5 per cent to 10 per cent of the ordinary bunker capacity. Perhaps one or more central bunkers with chutes to a number of stokers would be desirable, but the method of storing and distributing the coal is mostly a matter of detail arrangement.

It is not difficult to imagine conditions which will give additional economic importance to providing auxiliary bunkers for peak coal, conditions which will affect operating costs as well as investment cost. When they obtain, such an arrangement will recommend itself still more forcibly and is likely to show a decided saving both in the outlay for investment and in operating costs.

To state offhand the saving effected in dollars and cents is somewhat difficult, as location, the price of coal, cost of boiler equipment, and the like, are factors entering into the matter. Outside of the auxiliary coal bunkers, very few other changes will be necessary to adjust the fuel to the load conditions. With such an arrangement one precaution would have to be taken—to prevent waste of the higher grade coal, it being much easier to burn. With hand firing the difficulties connected with burning the higher-grade fuel serve as a good brake against this tendency in human beings to make things as easy for themselves as possible. But even at the worst it would not be a grievous problem for modern types of generating-station executives to solve.

In all events, the conservation of high-grade fuel is an important matter. This suggested development is not only a method of offsetting higher coal prices and effecting economies, but may be a necessity dictated by the anticipated post-war activity and commercial rivalry between the nations trying to restore the sadly depleted accumulations of decades.

Industrial Trucks in War Service

Shipyards, ammunition factories, army depots, khaki cloth mills, arsenals and other war plants all have had their work speeded up by the electric truck. Thousands of these ve-

hicles are now in use, thereby releasing men for employment in other occupations where labor is much in demand.

Economical Use of Copper

Does It Pay a Company to Maintain on the Pole Line, in Anticipation of Additional Load, Copper Wire That Remains Idle or That Is Not Working Sufficiently?

BY P. O. REYNEAU

Distribution Engineer Detroit Edison Company

WITH the increased price of copper and the unreliable deliveries brought about by the war the most efficient possible use of wire becomes a vital problem in many places. It becomes necessary to take stock and make the available wire in the warehouse and on the line go as far as possible. In many instances very radical changes are necessary.

FIG. 1—AVERAGE WIRE-STRINGING COSTS FOR POWER LINES

Many of these changes are not good engineering or good economics fundamentally, but they are forced upon operating companies by absolute necessity. In order to keep as nearly as possible on the right track it becomes imperative to analyze the situation critically and determine in so far as possible the relative value of all the factors entering the proposition, especially those that can be gaged in a concrete manner. Therefore the object of this paper is to attempt to suggest a way of handling the copper in distribution systems as they exist to-day.

As a starting point we can consider any distribution system of the present day and look at it critically, studying its load conditions and its saturation in various parts. There are all kinds of systems—good, bad and indifferent. Some have been built up without a clear concept of the underlying fundamentals of good distribution. Their growth has often been affected mostly by physical conditions, the laying out of streets, the regulations imposed upon operating companies by state, county or city governments. Each superintendent has developed his distribution system according to methods that seemed to fit in best with the conditions at the time of building, changing these methods as outside influences made it necessary to do so. Even where the best talent has been used for designing the system and where no expense has been spared to keep up with the latest improvements, it is very often true that those in charge have been so busy operating the old and putting in the new equipment that they have not had time to stop and look their distribution system over to realize how time has changed their conditions. For these reasons we shall find nearly everywhere that some wire is not working at all though it is probably charged, that other wire is working far be-

low its full rated load (determined by economical considerations and modified by its relative location and use in the system), and finally that some wire is overloaded, thereby causing losses greater than those allowed under economical operation. These conditions are usually natural ones; they are the result of unforeseen conditions such as unexpected or abnormal growth or decline of load.

It is not the purpose here to deal with overloads except by suggesting that idle wire could well be used in many cases to relieve them. The problem which will be considered can be summed up in one question: Does it pay to maintain on the pole line, in anticipation of additional load, copper wire that is idle or that is not working sufficiently? A question of such broad character cannot be answered with a yes or a no without any qualifications, but concrete information can be presented which should assist good judgment in approaching perfection.

In the first place, if the wire will not be put in service in its present location it is self-evident that it should be removed to the warehouse at the first opportunity and put up again as soon as needed in another location. The interest and depreciation on the wire is a net yearly loss while it is not being used. If it were in the warehouse as a part of the stock which must necessarily be kept on hand, the necessity of purchasing the same amount of new wire would be eliminated. If it were giving service on some line it would be earning a return on the investment. Even where the insulation is so far destroyed that the wire has only junk value its sale will permit the purchase of a certain amount of new wire. It should be noted that the expense incurred in taking down the wire will practically always be very small compared with the cost of

FIG. 2—AVERAGE EXPENSE OF REMOVING PRIMARY CIRCUITS

the wire. It should also be noted that the first cost of installation of the wire (possibly from 10 per cent to 60 per cent of the original cost of the wire) is a net property loss when the wire is removed. This loss to property really exists just as much whether the wire is up or down; the net loss of leaving it up remains the interest and depreciation yearly charge on the wire.

*Assisted by C. E. Mowrer.

In many cases it is impossible to determine definitely that lines will never be used again. When this is so it would be wise to hesitate about removing any wire from the lines unless forced to it by necessity. In order to make the proposition more definite, however, let us consider that a certain amount of wire is idle on the pole line at present but that it will be put to work

To reduce the cost of wire to a curve, the average weights per 100 ft. were plotted against wire size (Fig. 3). As the wire depreciates only in so far as insulation is concerned, the annual depreciation rate will be $6\frac{2}{3} \times$ (insulation weight \div total weight), if the copper market is stable, assuming the life of insulation to be fifteen years. Curves for this ratio are plotted against wire size in Fig. 4. Finally, by combining the several curves and their equations, an equation and curve was found, as shown in Fig. 5, that expresses the relation desired.

The expressions for each relation and methods of combining them to give the final equation are shown in the following. It should be noted here that interest was taken at 6 per cent and the cost of copper at 30 cents per pound (13.6 cents per kg.). Other values can be substituted in the equation. For a more general solution it would be desirable to carry these factors through the equations to a final one where any value could be substituted, but this procedure would have complicated the final equation too much for this discussion.

Solid Wire

Years = (stringing cost + removal cost) \div total annual fixed charges

Circ. Mils

$$\text{Stringing cost} = 0.000345 + 126$$

$$\text{Removal cost} = 0.000215 + 34.5$$

$$\text{Total} = 0.00056 + 160.5$$

$$\text{Cost of wire/100 ft.} = \text{cost/pounds} \times \text{weight 100 ft.} = 30 \times (0.000356 \text{ circ. mil} + 4)$$

$$\begin{aligned} \text{Cost of wire in place} &= \text{original cost} + \text{stringing cost} \\ &= 30(0.000365 \text{ circ. mil} + 4) + 0.000345 \text{ circ. mil} + 126 \\ &= 0.01068 \text{ circ. mil} + 120 + 0.000345 \text{ circ. mil} + 126 \\ &= 0.011025 \text{ circ. mil} + 246 \end{aligned}$$

$$\text{Interest/year on investment} = 0.06$$

$$\text{Depreciation/year on investment} = 0.067(3.4 \text{ circ. mil}^{-0.219})$$

$$\begin{aligned} \text{Interest and depreciation/year} &= 0.06 + 0.067(3.4 \text{ circ. mil}^{-0.219}) = (0.06 + 0.226 \text{ circ. mil}^{-0.219}) \\ &\text{in per cent} \end{aligned}$$

$$\begin{aligned} \text{Annual fixed charges} &= (0.06 + 0.226 \text{ circ. mil}^{-0.219})(0.011025 \text{ circ. mil} + 246) \\ \text{Years} &= (0.00056 \text{ circ. mil} + 160.5) \div [(0.06 + 0.226 \text{ circ. mil}^{-0.219})(0.011025 \text{ circ. mil} + 246)] \end{aligned}$$

$$\begin{aligned} \text{Years (solid)} &= (0.00056 \text{ circ. mil} + 160.5) \div (14.75 + 0.00066 \text{ circ. mil} + 0.00249 \text{ circ. mil}^{0.751} + 55.6 \text{ circ. mil}^{-0.219}) \\ &\quad (1) \end{aligned}$$

Stranded Wire

Years = (stringing cost + removal cost) \div total annual fixed charges

Circ. Mils

$$\text{Stringing cost} = 0.000345 + 126$$

$$\text{Removal cost} = 0.000215 + 34.5$$

$$\text{Total} = 0.00056 + 160.5$$

$$\begin{aligned} \text{Cost of wire/100 ft.} &= \text{cost/pounds} \times \text{weight 100 ft.} \\ &= 30 \times (0.000385 \text{ circ. mil} + 4) = (0.01155 \text{ circ. mil} + 120) \end{aligned}$$

FIG. 3—AVERAGE WEIGHT PER 100 FT. OF TRIPLE-BRAID WEATHERPROOF WIRE

some time in the future. In this case the time during which the wire will be idle is the determining factor in the study of economy.

A. If the idle line is taken down and used and no new wire is bought, the following costs are involved:

Removal cost from old position.

Stringing cost of new wire.

Interest and depreciation on wire for length of time before it will need replacing in old position.

Cost of stringing new wire in old position at end of that period.

B. If the old line is left up and new wire bought to build present extensions, the costs involved are:

Stringing cost of new wire.

Interest and depreciation on old wire left up idle.

Interest and depreciation on new wire.

Equating the cost of operations A and B and solving for the time gives that length of time in years where the costs involved in leaving the line up idle and buying new wire to fill present needs just equal the costs involved in taking it down and restringing it. In other words, if the line is to remain idle longer than this period of time, it will pay to remove it at once and then replace it when necessary. If the line must be replaced sooner than this time, it would not pay to take it down. Several factors enter into both sides of the equation and may be eliminated from the calculations,

FIG. 4—RATIO OF INSULATION WEIGHT TO TOTAL WEIGHT FOR TRIPLE-BRAID WEATHERPROOF WIRE

leaving the following as active terms: (1) Removal cost from old position, restringing cost in old position; (2) interest and depreciation on new wire.

The method of procedure is as follows: Wire stringing and removal costs per 100 ft. (30.5 m.) of single wire have been obtained from available data, these costs being plotted against wire size in Figs. 1 and 2.

Cost of wire in place original cost stringing cost
 (0.01155 circ. mil + 120) +
 (0.000345 circ. mil + 126)
 0.011895 circ. mil + 246
 Interest year on investment 6 per cent 0.06
 Depreciation year on investment 0.067 (2.4 circ. mil⁻¹)
 Interest and depreciation year 0.06 +
 0.067 (2.4 circ. mil⁻¹) = (0.06 + 0.1608 circ. mil⁻¹)
 Annual fixed charges = (0.06 + 0.1608 circ. mil⁻¹)
 (0.011895 circ. mil + 246)
 14.75 + 0.00071 circ. mil +
 0.00191 circ. mil^{0.79} +
 39.557 circ. mils^{-0.21}
 Years (stranded) = (0.00056 circ. mil + 160.5) :
 (14.75 + 0.00071 circ. mil + 0.00191 circ. mil^{0.79} +
 39.557 circ. mils^{-0.21}) (2)

Curves obtained by substituting various sizes of wire expressed in circular mils in equations (1) and

FIG. 5—WHEN IT PAYS TO TAKE DOWN IDLE WIRE

If the line is to remain idle longer than the period indicated it will pay to remove it at once and replace it when necessary. If the line must be used before this time it would not pay to take it down.

(2) are given in Fig. 5. They apply to only one general case where one given size of wire is replaced on the same pole line with the same size of wire, there being a time interval between the removal of the first wire and the installation of the second. There are naturally a great number of possible combinations of various sizes of wire being replaced by various other sizes, and for each case data and curves could be obtained. This one general case can only suggest what could be expected in all the others.

In this discussion there remains to be considered the economy of replacing with smaller wire large wire that is not loaded sufficiently. Here again curves could be obtained to show the length of time at which the interest and depreciation of the large wire would equal the interest and depreciation on the small wire plus the cost of installing and removing the large wire. It has been attempted here to indicate by one concrete example what is the correct point of view to take with regard to the working efficiency of copper wire on distribution systems, to furnish some definite assistance to the good judgment that is necessary for successful handling of all matters dealing with the future.

CONCLUSIONS

The curves of Fig. 5 tend to lead to the conclusion that not enough attention has been paid to the removal of wire when it is not effective in distribution systems and that a greater over-all efficiency would probably be obtained by doing away with idle wire or wire not working sufficiently. It is obvious that under present conditions, with the price of copper far above the

average price formerly paid for the distribution system as a whole, and probably higher than it will be in the future, the removal of wire as suggested above is far more profitable than if all wire had been and would be purchased at the same price. At the same time it should be noted that a uniform price of copper at 30 cents was assumed in plotting the curves; thus the above gain was not taken into consideration and the proposition was not made so general as it could be.

DUCT SPLICING SAVES SHORT LENGTHS OF CABLE

How Splice Diameter Is Minimized—Tests Indicate Practicability of Splice—Extent to Which Duct Splices Are Used

BY J. B. NOE AND A. RABE
New York Edison Company

THE financial loss due to inability to utilize short lengths of cable is a serious one to all companies operating underground systems of distribution. These lengths are constantly accumulating owing to withdrawal of old cable necessitated by changes and replacements of existing circuits. Large companies doing a great deal of underground work keep these lengths and eventually can utilize them by matching in with new construction, but this involves keeping on hand a large quantity of slow-moving stock, tying up investment and often using valuable space for storage. Smaller companies usually are obliged to scrap their short pieces of cable, often at only a fraction of the original cost.

It has long been the practice to splice the shorter lengths of small cables, such as arc-light and main cables, to make up lengths that could be used, but a joint such as is usually made in large high-tension and low-tension feeders would be too big to draw into the standard-sized duct. It has doubtless occurred to many underground superintendents, however, that if a small enough splice could be made in such feeders much of

FIG. 1—DUCT SPLICES IN THE MAKING

The splice in the foreground shows the staggering of the individual conductor joints employed to minimize the diameter of the joint. In the background a man is lead-burning a split sleeve to the sheaths of two cables that have just been joined. Note small diameter of splice compared with cable.

this slow-moving or waste cable could be utilized. This possibility is of especial interest at the present time owing to the high cost of metals, difficulty in obtaining cable deliveries and desirability of releasing as far as

possible the full capacity of the cable factories for the manufacture of materials directly useful in the prosecution of the war. In view of these facts the long experience of one of the large lighting companies in the development and use of duct splicing may be of interest.

HOW SPLICE DIAMETER IS MINIMIZED

The underground department of this company made such a splice in November, 1904, joining two sections of three-conductor, 250,000-circ. mil., 6600-volt cable. The diameter of the splice was kept down by staggering the joints in the three conductors, making a joint 24 in. (71 cm.) long, over which was placed a split lead sleeve slightly larger than the original cable, soldered at the seam and wiped to the cable sheath at the ends. This joint was made by drawing in the first section, making the splice in the manhole, and then resuming the pulling, drawing the splice and second section on into the duct. This original duct splice remained in service without failure for several years and when finally withdrawn for some cable changes was opened and found perfect.

Prior to 1911 no great difficulty was experienced by this company in utilizing short lengths of feeder cable, the large amount of construction work continually in progress providing a comparatively ready outlet for such material. In this year, however, the size of the standard high-tension feeder was increased from 250,000-circ. mil. round conductor to 350,000-circ. mil. sector, all new cable purchased being of the latter size. As a result large quantities of the smaller-size cable began to

ever occurred in any of these splices or on any of the more than 600 duct splices made on various cables.

During the next few years very extensive changes in the underground cable system due to starting up a new generating station provided an ample outlet for released cable, but in 1915, the accumulation of short lengths again becoming critical, serious attention was turned to the duct splice. Before adopting it as a permanent policy for all types of cable, tests were conducted to determine:

First—Mechanical strength, both of the spliced sleeve and the spliced conductor, as compared with the strain put on them in installing and withdrawing the cable under the severest duct conditions.

Second—Dielectric strength of the duct splice after it had been subjected to the strain of installation.

Third—Heating in the duct splice due to heavy loads.

All of these tests showed the duct splice as made up to be superior to the body of the cable.

A decided improvement was made at this time by "burning" on the lead sleeve instead of using solder. This made the joint as flexible as the rest of the cable, and as the spliced lengths could be put upon reels without fear of cracking, it became the practice to make the joints in the cable yard instead of in the manhole, effecting a very great saving in cost. At odd times and on rainy days the short pieces were spliced up to make sections of such lengths as could be easily matched.

During 1916 a duct splice was developed for two-conductor, 1,000,000-circ. mil low-tension concentric

GENERAL VIEW OF CABLE-SPLICING HOUSE

In this room short pieces of cable are spliced into continuous lengths and reeled for future use. At the left is a carriage bearing a geared-down motor which may be connected with any reel

in the house by sprocket and chain. Note gas tanks for burning cable sleeves and V-shaped mirror under cable by which inspector can examine physical conditions of all sides at once.

accumulate in the stockyard, it being impossible to match in the short lengths of old cable as parts of new feeders as had been the previous practice.

In the same year the proposed addition to the system of about twenty-five high-tension service connections offered a tempting opportunity for the use of this cable, provided that it could be spliced up to make such lengths as could be used in existing subway. Duct splices similar to the one made in 1904 were successfully utilized, and all these connections, involving the use of more than six miles (9.7 km.) of feeder, were made, using this old cable exclusively. Not one failure has

cable with three pressure wires. Large quantities of slow-moving stock of this type of cable were thus made available for immediate use.

Among the various types of cable on which the duct splice has been used, two deserving of special mention are triplex 350,000-circ. mil, 25,000-volt armored submarine cable and single-conductor 2,500,000-circ. mil low-tension cable with pressure wires. Of the first type three 910-ft. (277-m.) reserve lengths were made available for immediate installation as four 610 ft. (186-m.) lengths by cutting and splicing. Of the latter type 2100 ft. (640 m.) left dead in the subways by

The starting of a new substation were salvaged and are now installed as direct feeders to a new large customer.

Some idea of the amount of cable transformed from scrap or very slow-moving stock to actual service may be gained from the fact that the company previously referred to has to date a total of 211,569 ft. (approximately 64,460 m.) of duct-spliced cable of various types, representing a value of approximately \$380,000. Practically all of this material is now installed.

SPlicing DONE IN CABLE HOUSE

The work of making these special splices was at first done in the cable yard, temporary tarpaulin shelters being erected for protecting the exposed ends of the cables from rain, snow or whatever necessary. As the work assumed larger proportions it was decided to erect a building with special facilities for handling the reels expeditiously and with a minimum of labor. A narrow-gage track enters this building from the point where the reels are delivered by truck and runs the entire length of one side. The reels are placed on small cars running along the track, from which they can be delivered to any of the six splicing stations. At each

of these stations are two specially designed cable racks to hold the reels, the splicing being made between the racks. An electric motor with suitable speed control has been mounted on a car, and by means of a sprocket and chain connection can be used to reel or unreel cable on any of the racks. Only one man is required for this work instead of the usual gang of four or more. A convenient system of piping makes easy the connection of the oxy-acetylene outfits used for the lead burning at each of the splicing stations, thus avoiding a multiplicity of tanks.

Very little expense for material was incurred in the equipment of the splicing house. Much of it was rescued from the scrap heap, and some, such as the rails of the narrow-gage railway, was purchased from contractors at practically its scrap value.

While it would not be necessary for all companies using cable to prepare such an elaborate plant for duct splicing as the one described, it is obvious that all companies generally can adopt with great advantage the practice of making such duct splices to save considerable cable material that would otherwise be scrapped or kept in slow-moving storage.

Central-Station War Service

Analysis of Power Load of Representative Company Shows that More than 90 per Cent of the Energy Delivered to Motors Is for War Material Production—Nine Routings for Power Supply to Industrial Plants

UNTIL the war is over nothing like a full account of what the modern central station is doing to help win the great conflict for democracy and liberty can be prepared for publication; but when the inside story becomes known the entire electrical industry will be proud of its record. War to-day is a conflict between entire nations and not only a series of campaigns against armed enemies. An organized, efficient producer and distributor of electrical energy is therefore one of the most valuable resources of a community engaged in the manufacture of munitions and other supplies for war use. More and more, industry is going upon a war basis, and steadily the demand upon the central station increases in this connection. In some cities the supply of power to war customers is now so large a part of the business that the management of the local central station has comparatively little time for the consideration of any other outlets for his plant capacity, if, indeed, he is not looking anxiously into the future and wondering how and when he will be able to secure additional equipment to meet forthcoming war industrial requirements and whether, when such equipment is installed, the supply of fuel will be sufficiently continuous to enable him to give 100 per cent service.

President Wilson and other officials of the government have gone on record on behalf of the central station's essential service, and many of the leaders of the industry appreciate to the full the important part the electric utility company is playing in efficient war material production. Many central-station employees, however, scarcely realize the scope and variety of this service or the close connection between the way in

which they do their daily work and the "carrying on" of the country's war activities. For this and other reasons it is of interest to examine the war service work of a central station in the East now supplying energy to a city of about 200,000 population and which recently through its power sales department made a survey of the so-called "war load."

This investigation was undertaken last December as the coal situation became more and more threatening, and was primarily intended to anticipate curtailment of power, especially to factories not engaged in war material production. The following questionnaire was sent at this time to the company's larger power customers:

"In order that we may have on hand a record of companies doing government work, will you please send us the following information:

"Government Contracts.—(1) Contract numbers; (2) date; (3) material; (4) percentage of factory output.

"Government Sub-Contracts.—(1) With whom (name and address); (2) contract number and date; (3) sub-contract number and date; (4) material; (5) percentage of factory output."

The response was very gratifying, for practically every questionnaire sent out was returned with the desired information, thus showing the hearty co-operation of the manufacturers, who realized only too well what a shut-down of their power would mean.

These questionnaires were classified by the power sales department, and a complete survey was made of all power customers of the company. The customers were divided into the following classes:

1. Factories devoted to war industries.
2. Factories devoted to war essentials and public necessities.
3. Non-war industries.

Under Class 1 were placed all customers who are actually engaged in war work, such as manufacture of ammunition, ammunition trucks, gun platforms, gun-mount parts, shell tools, torpedo equipment and other ordnance; textiles, such as tent tops, blankets, army woolens, and equipment for the emergency fleet, including machine manufacture of all kinds. Practically every department of the government was being supplied with material from these different factories.

Under Class 2 were included such war essentials as meat and provision factories, wholesale food producers, public utilities such as telephone, telegraph and gas companies; public schools, daily papers and the necessary lighting for police protection in the city.

Under Class 3 were included such non-essential industries as those of wall-paper manufacturers, printers, department stores, brewers and liquor sellers.

These classified data and the connected load of each customer were taken from the latest available records of the central station, and the kilowatt demand (fifteen-minute) was taken from the demand-meter record of each customer. Whenever there was any doubt as to the classification of a power user his load was placed in the lower class. This assured the central station of a conservative estimate of the power output for government work, enabling each case to be taken up individually in case of curtailment.

RESULTS OF CLASSIFICATIONS

The results of these classifications may be summarized as follows:

Class	Number of Customers	Hp. Connected	Percentage Connected Power
1	129	20,598	67.9
2	185	6,780	22.4
3	154	2,941	9.7

From this it appears that 90.3 per cent of the total connected power load is devoted to war industries and war essentials. Forty-seven representative factories in Class 1 have a total arithmetical demand sum of 9994 kw. and a connected load of 17,620 hp. This is an average of 376 hp. per customer, with a demand per customer of 0.568 kw. per horsepower connected load.

In Class 2 seventeen representative customers, with a total connected load of 3692 hp., have an arithmetical demand sum of 1677 kw., an average connected load of 217 hp. and a demand of 0.454 kw. per horsepower connected.

In Class 3 eight representative customers, with a total connected load of 1168 hp., have an arithmetical demand sum of 522 kw., with 146 hp. average connected load and a demand of 0.447 kw. per horsepower connected.

This indicates that the factories devoted to war work are pushing their mills harder than those on the so-called non-essentials.

Inasmuch as 74 per cent of the total station output is power and 90.3 per cent of connected power load is devoted to war work or the war essential industries, it follows that 67 per cent of the total station output is devoted to the war industries.

On the basis of the above classification, the average monthly output devoted to war work is 3,100,000 kw.-hr. out of a total of 4,000,000. The latter includes

power, commercial, residential and street lighting. The installed capacity of the station at the time of the survey was about 40,000 kw.

This plant, like many other central stations, is so tied in with other reliable and interconnected sources of power that an adequate supply is assured at practically all times. In the city where the above analysis was made there are no less than nine different routings by which power can be supplied to the customers in the event of a partial shut-down of any of the substations. In other words, the power service of this company has as many lives as the proverbial cat!

Preliminary studies of the individual loads in these war industry plants indicate that the diversity factor is between 1.5 and 2. In some cases the load conditions are unusually good.

It is significant that this station, in negotiating at present for additional power loads, finds upon a conservative estimate that 89.5 per cent of the new "prospects" are devoting their energies to war industries.

Based on an average isolated mill-plant fuel consumption of 4.5 lb. to 5 lb. of coal per horsepower-hour, this one central station is saving the country and its allies about 3500 tons of coal per month in supplying power to war industries alone, and through its interconnection with other systems not only is the service safeguarded, as mentioned above, but the use of fuel within the various connected plants is kept down to economical limits. Although over sixty employees of this company are with the colors, the foregoing data prove that not all the patriotic service of the central-station personnel is being performed in uniform. The priority rights of the central station in the matter of fuel, equipment and material supply are very much in evidence in the face of such facts as the foregoing. The central station is doing its part splendidly in the great cause to which the uttermost resources of the civilized world are being summoned and dedicated, and every faithful employee shares in the honorable performance of this high and responsible duty.

Tungsten Patent Suit Dismissed in England

A reserved judgment, dismissing the appeal of the British Thomson-Houston Company against an order of the Court of Appeal confirming the judgment of Justice Astbury in favor of Durham, Ltd., has been delivered by the House of Lords of England. The issue was whether a patent for the treatment and working of metallic tungsten was valid.

The main object of the patent on which the present action was brought was to manufacture the filaments by drawing the tungsten in the form of wire.

The Lord Chancellor was unable to read the words "the metal in a coherent form" as meaning tungsten which had been subjected to appellants' preparatory process as described in the specification.

Appellants further asserted that the application of heat, especially of continuous heat during the process of working, showed invention and was good subject-matter. There could be no subject-matter in the application to tungsten of the old process of working under heat. The claim was merely for subjecting the metal to the action of heat while it was being worked, and the operator was left to find out by experience what were the necessary precautions.

War's Influence on Central-Station Selling

Changes in New-Business Methods Forced by Prohibitive Cost of Extensions—Getting More Business from Existing Customers—Eliminating the Carbon Lamp and Furthering Use of Appliances

THE great war has brought many influences and counter influences through the past year that have affected central-station policy and practice in many ways. In no department, however, have these war-time conditions been more far-reaching in their contact than in the field of selling. The national concentration on the winning of the war has begun to warp the daily lives of all the people and is naturally reflected in their dealings with the central station. As they react to their increased prosperity or greater caution in the face of the uncertainties of the times, the central station feels it promptly. The industry, therefore, has step by step been adjusting itself to each new factor in the market, working carefully to maintain a balance between the present higher costs and physical restrictions in doing business and the natural desire to render service to the utmost.

The first great change which the war demanded came in the matter and manner of taking on new business. The steadily mounting cost of copper and other materials soon reached a point where the expense entailed in making an extension to connect a new consumer was more than the business was worth. At the same time conditions in the money market made it practically impossible to finance any further investment of the sort, and as a measure for the conservation of capital there has been a general embargo declared against new business. The degree to which it has been necessary to apply this restriction has, of course, varied widely with conditions in the city.

PROVIDING POWER FOR WAR INDUSTRIES

Naturally, the most pressing obligation is to provide the power needed for industrial uses so essential to the winning of the war. Whenever there has been so great a demand that the capacity of the station has been hard pressed, active measures have been taken to protect the vital industries at all cost. In Seattle, Wash., Worcester, Mass., and several other cities the co-operation of local manufacturers was actively secured and a better distribution of the load effected through slight changes in the hours of starting and quitting and other rearrangement of the power uses. In Springfield, Ohio, a meeting of the leading local business men and manufacturers was called, at which the central station laid the matter before them and said: "Here is the power that we can provide. How shall we apportion it among you to best advantage?" In the face of the practical impossibility of securing additional station capacity without conflicting with the government's huge need for electrical machinery of every kind such measures have been very helpful.

Even where the capacity has been safely available the prohibitive cost of extensions has been met by requiring the customer to finance the cost himself. The Cleveland Electric Illuminating Company, for instance, established a form of contract under which the customer advanced the cost of construction, and the normal cost,

that is to say, the cost as of July 1, 1914, is returned to the consumer in periodic payments. This plan has been applied with varying details by many companies, some restricting all new business to locations along existing lines and others further holding it down to loads of definite characteristics. The Commonwealth Edison Company of Chicago and the Public Service Company of Northern Illinois petitioned the Utilities Commission to suspend the rule covering extensions for the period of the war. All the subsidiary companies of the Eastern Power & Light Company and General Gas & Electric Company announced to the public that as a war conservation measure no further extensions or connections would be made. These cases are typical.

With this general policy in force the selling effort has resolved itself into the development of more and better business from existing customers, both through the sale of household heating and power appliances to residence consumers and more motors to the industrial field; and in both directions the war itself has actively created market. The higher costs of living in these times and the growing scarcity of domestic servants have wrought a revolution in the attitude of the average housewife and her husband toward investing in modern home efficiency equipment. A good example is reported from Elmira, N. Y., where two large local industries advertised for women and within a few weeks took several hundred out of domestic service. This meant that hundreds of housewives were suddenly obliged to do their own work, and there came an immediate demand upon the central station for all kinds of electric household appliances to help them do it. The growth in power business, of course, has been tremendous owing to the general speeding up of industries all over the country under the impulse of war work.

Under these conditions there has been great opportunity for awaking the public to the value of electric service for saving time and labor in the home as well as in the factory, but not all central stations have taken advantage of the situation to build up the load along existing lines. Campaigns for the sale of cleaners and washing machines and other appliances where held have been particularly productive.

STRAIGHTENING OUT THE PRICE POLICY

The outstanding feature of this whole merchandising movement by central stations, however, has been the almost universal straightening out of the policy of price. Under the influence of the times it has been possible to increase prices without fear of the public misunderstanding the reason for it. Higher costs are forcing higher prices in all lines, and the revision of resale schedules necessitated by the raising of the manufacturers' list has brought to many companies the opportunity to bring an end to cost selling practices which had been robbing them of proper profits in the past. The old idea of embracing almost everything the customer required under the head of service, and looking

to the sale of energy to pay for it, has been made more difficult under war conditions.

As a result, a much healthier condition has been developed in the field of merchandising. The urgency of the need for holding down investment and decreasing the expense of maintaining the new business department has demanded more profit from sales and has gone far to rectify the old mistaken policy of selling goods too cheaply in order to get them on the lines. In addition many companies have instituted charges for all work done by troublemen on the customer's premises. In Rochester, for instance, when a man goes out on a "lights out" complaint, a charge of 25 cents is made for the call plus the retail price of the fuses installed, provided, of course, that the trouble was in no way the fault of the company. All this has greatly improved the position of the central station in its purely business dealings with the public, placing its scale of compensation more nearly on a basis of value received.

Over-long periods and easy-payment terms formerly offered in the sale of appliances have also been corrected in some cities at the same time. Also, as in New Orleans, the work of eliminating the carbon lamp has been taken up under the plea for war-time efficiency, and a most successful effort made to convert all consumers to the use of tungsten lamps. This, of course, is particularly timely. The idea appeals to the public as a further way to save and at the same time offers an immediate benefit to the central station by reducing the cost of lamp renewals. In Houston, Tex., an annual saving of about \$700 has been effected in this way. Such campaigns, supported by the sale of tungsten lamps at list, have been found well worth while.

This practice of pricing lamps at list, by the way, has been steadily growing under the influence of the times, and bids fair to continue to spread. In connection with this educational effort to extend the use of tungsten lamps many utilities have advertised broadly the need for conserving power and urged the public to exercise care in the use of light, turning off all lamps when not in actual use.

THE EVER-PRESENT LABOR QUESTION

One of the first reactions from the war affecting the central station was, of course, the labor situation, and this has brought a difficult problem which is being met in many ways. The sales department staff is usually composed of young men, and the number of these salesmen who have left to join the national forces has been large. There has been a tendency not to replace these men but rather to curtail the work of the department and save that much expense, and in fact often companies have transferred the members of their commercial departments to fill other jobs elsewhere and in these cases have practically discontinued all selling work. They feel that at this time they can better afford to drift with the current of their growing business and save the cost of salesmen's salaries. A practical alternative, however, has been applied in other cases by shifting the selling force onto a commission or salary-plus-commission basis, under which each man can prove himself self-supporting and therefore profitable. The Doherty companies have been operating on this plan for some time, and under the stimulated demand for appliances sales and profits have grown.

The profitableness of sales activities has been fur-

ther increased by the fact that the men have been concentrating along existing lines in the effort to fill up the valleys of the load by selling more motors and appliances to present customers. This work in many cases has taken the form of special campaigns on the high-priced motor driven appliances, like the washing machine, the dish washer and vacuum cleaner, which, while adding little to the load, pay a generous profit.

SMALL ECONOMIES BEING SOUGHT

But this is only one of the broad problems of administration where, under the spur of urgency, chances for new efficiencies in the operation of the business side of the central station have been discovered. The need has been to get along with fewer men and save as many dollars in as many ways as possible. Combination companies have found that they could save by having both gas and electric meters read by the same man, by billing for both on the same card, by having the same wagon set both meters, and, in short, eliminating duplication right down the line in its dual relations with the customer. Delayed meter-reading cards have been introduced which the reader slips under the door when he is unable to gain access to the premises, asking the consumer to indicate on a printed dial the reading of his meter. This saves many second calls. Systematic canvasses have also been made of all installations where more than one meter is in use, and many cases have been found where a single meter would suffice. This has not only restored a meter for service elsewhere but has brought a saving in the entire routine, from the reading to the paying of the bill.

It is in these innumerable small economies that the best results have been obtained in tuning up the system to a higher efficiency. The use of women and old men for meter reading has been tried out most successfully. Schoolboys have been adopted for delivering bills in Sandusky, Ohio, after very careful experiment, and their use is spreading—as is the use of women bill deliverers. This frees man-power for other work and at the same time cuts the cost appreciably. By changing over from the end-of-month to continuous meter-reading system it has also been possible to do the work with fewer specialized employees, and in Leavenworth, Kan., they are successfully trying the experiment of having the customer apply for his own bill when he comes to pay the money during the discount period. It is believed that this will reduce the cost and detail of bill delivering to a very small minimum. These and other measures for reducing delinquency and short-cutting the detail of reading, billing and collecting have received attention everywhere and have borne good fruit in small economies. A general appeal to the public to pay bills promptly in consideration of the times has brought response in almost every city.

The past year of war, therefore, has been a period primarily of business housecleaning among the central stations. Not only has the dead stock been brought out of storeroom corners, bargain-priced and sold to turn this dead investment into coin, but all those small details of administration system left in normal times to run themselves have been gone over with a fine comb with such results as have been enumerated. Matters of interrelationship with the local contractors have received a growing consideration, and in many cases a better degree of working harmony has been effected.

Present Status of Brass Melting—II*

Relative Merits of the Different Types of Electric Furnaces That Are Now Upon the Market—Only Two of These Have Been Found to Be Suitable for Use with Alloys That Are High in Zinc

BY H. M. ST. JOHN

Commonwealth Edison Company

Four types of electric furnaces are in commercial use for melting copper alloys. Of these only two are suitable for use with alloys high in zinc. One, the vertical-ring induction furnace, operates at high efficiency, but is somewhat limited in its application and not sufficiently flexible for general foundry use. Within its limited range it appears to be giving very satisfactory results. The indirect-resistance, indirect-radiation furnace is less efficient and has a lower rate of production in proportion to its holding capacity, but is more flexible and better suited to general foundry use. Neither of these furnaces can be classed as altogether satisfactory, but each is serving a useful purpose.

The indirect-arc furnace is in use for melting alloys which contain small percentages of zinc and those which contain no zinc at all. It is more efficient than the indirect-resistance furnace and, within its field, more flexible than the induction furnace.

The direct-arc furnace is being used to a limited extent in melting copper alloys which contain no zinc. Present conditions make its use profitable in some cases, but its continued application for this purpose is not assured.

THE obvious method of reaching a high thermal efficiency without overheating an alloy is to generate heat in the metal itself by the passage of an electric current through it—either by a direct resistance furnace, in which electrical contact with the metal is made through electrodes, or by means of an induction furnace, in which case the metal forms a complete circuit for the flow of an induced electric current, without the use of electrodes. In either case it is practically necessary to establish the circuit through molten metal previously melted in some other furnace.

The "pinch-effect" direct-resistance furnace was the first type in which this principle was utilized. Virtually all of the heat is generated in the molten metal temporarily occupying channels or tubes. The main portion of the metal, occupying the furnace chamber above, is heated by contact with the hot metal, and solid metal added to the bath is melted by the same means.

The stirring action of the moving streams of metal is vigorous, and the temperature of the main portion of the bath rises uniformly. There is no difficulty in restraining the vaporization of zinc, and, in fact, it may be said that the metallurgical requirements of any single alloy are almost perfectly fulfilled.

Generation of heat in the metal itself, where its presence is desired, is theoretically ideal from the standpoint of efficiency, since no part of the furnace is any hotter than the metal, and wall losses are reduced to a minimum. With this type of furnace, however, the massive metallic electrodes require a considerable water cooling. Consequently a large quantity of heat escapes from the furnace, and the thermal efficiency is much lower than it would otherwise be. Considerable difficulty has also been experienced in constructing satisfactory transformers for use with the extremely low voltages and high currents required. So far as is

known to the writer this furnace is not now used extensively.

The next step in the development of electric furnaces was the application of a similar principle to the induction furnace. In this the use of electrodes and troublesome transformers is avoided, since the furnace serves as its own transformer. The generation of heat takes place as before in the resistor channels, and the same vigorous circulation of metal results. Whether this action is due primarily to the pinch phenomena or to a motor effect resulting from the flow of current through the continuous molten resistor is open to question. It is difficult to tell where one phenomenon leaves off and the other begins.

The thermal efficiency of the induction-type furnace, operating, as it does, without electrodes, is very high, probably higher than that of any other electric furnace ever tried out for copper-alloy work. Its metallurgical characteristics are also excellent. It offers a perfectly steady, uniform load at a power factor which is satisfactory, at least in the relatively small sizes so far built, the largest requiring a 60-kw. input and pouring 600 lb. of metal per heat. In larger sizes there might be trouble with low power factor, as is so frequently the case with large induction furnaces.

The induction furnace is in commercial use and is said to be giving satisfactory results. It has, however, pronounced limitations which are partly inherent in its design and partly remediable. Its small size is one disadvantage, but it is probable that somewhat larger sizes can be successfully built. So far it has not been found practicable to use the furnace with alloys high in lead, because that metal has a tendency to penetrate minute cracks in the lining of the resistor channels, causing short circuits. The remedy for this is the development of a lining especially suited for use with lead.

LIMITATIONS OF INDUCTION FURNACE

The more serious limitations of the furnace are its lack of flexibility in changing from one alloy to another and the practical necessity of operating it continuously, never allowing the furnace to cool oftener than once a week. The length and cross-section of the resistor channels are especially designed to accord with the electrical resistance—in the molten state—of the alloy which is to be used. These same resistor channels cannot be employed with another alloy of widely different resistance, which, accordingly, requires the installation of new channels of properly modified design. In changing from one alloy to another, even if the resistance is approximately the same, it is necessary to pour the furnace clean and start with a molten charge of the new alloy, melted in another furnace.

The linings of the resistor channels stand up very well under continuous use but deteriorate rapidly un-

*See article by same title in June 1 issue.

der the daily heating and cooling of ten-hour-day operation. This can be obviated by maintaining over night sufficient power to keep the channels filled with molten metal, which, of course, results in some addition to the cost of operation.

The limitations mentioned tend to prevent the use of this furnace in commercial foundries, which melt a wide variety of alloys and do not work nights, but form no bar to its use in yellow-brass rolling mills, to the purposes of which it seems well suited.

There has been proposed a new design of induction furnace which would not be subject to the foregoing limitations. In this type a spark gap and an arrangement of condensers connected in series and in parallel are used in the primary circuit of the furnace, which operates at about 10,000 volts and some 15,000 to 20,000 cycles. The secondary of the furnace consists of a crucible or melting chamber with electrically conducting walls. The metal within the crucible also carries part of the secondary current, to a minor degree when it is first charged in the form of solid pieces, to a much greater degree when it becomes molten. The primary circuit is arranged around the melting chamber and is separated from it by suitable refractory and heat-insulating walls. The furnace is, in a sense, an eddy-current rather than an induction furnace, since no iron cores are used and the metal itself, lying in a circular pool, completely short-circuits what, in an induction furnace, would be called the secondary circuit. This unique arrangement is made possible by the exceedingly high frequency used.

According to last accounts, this furnace had been built only in very small sizes, capable of pouring not more than 45 lb. (20.4 kg.) of metal per heat. There is no apparent reason why the metallurgical characteristics should not be good, and the construction of the metal-containing portion of the furnace is desirably simple. It is obviously unnecessary to use molten metal in starting the furnace. Any alloy or even non-conducting material, such as glass, can be melted without changing the furnace design. The furnace is suitable for intermittent operation and need not be kept hot overnight.

ARC FURNACES

Next to the methods already described the most direct way of applying heat to the metal is by means of a heat source outside but in direct contact with the bath. The direct-arc furnace is the only type which utilizes this principle.

The application of direct-arc furnaces to copper alloy melting has been rather limited. One or two furnaces designed for steel melting have been tried, but no new type of direct-arc furnace has been developed for this specific purpose. No furnace of this general type has ever succeeded in satisfactorily melting yellow brass or other copper alloys containing an appreciable percentage of zinc. The high-temperature heat source in direct contact with the bath overheats the metal in its immediate vicinity and always causes excessive loss of zinc.

With copper alloys containing no zinc conditions are somewhat different, since lack of uniformity in heating is less likely to result in serious loss. In a direct-arc furnace of small size it has been found possible to melt a copper alloy containing as much as 15 to 20 per cent lead with less loss than is commonly the case with the

same alloy in fuel-fired crucible furnaces. In larger furnaces the greatly increased rate of heat input supplies heat to the metal in the neighborhood of the arc more rapidly than it can be conducted away to more distant portions. As a result the surface of the metal becomes overheated while other parts of the bath are still much below the desired temperature.

ADVANTAGE OF DIRECT-ARC FURNACE

The direct-arc furnace has the advantage of simplicity and high thermal efficiency. Its design has been more highly developed and perfected than that of most other electric furnace types. Since it is so widely used in the steel industry, several reliable and readily available furnace designs are on the market. It is very doubtful, however, if any direct-arc furnace deserves wide application for melting copper alloys. Its use is limited to only a few of the common alloys, and, if large units are employed, the metal loss, even with these alloys, is likely to be serious. Small units are more satisfactory in this respect, but are subject to the disadvantages of lower efficiency, higher fixed charges and higher operating costs per ton of metal produced.

Such direct-arc furnaces as are now in use in this field—and there are a few—hold their place by virtue of their simplicity, their elimination of crucible cost and their high rate of production, at a time when these qualities are at a premium.

The intensity of heat application to the metal is lessened somewhat by using an arc between two or more independent electrodes above the bath, heating the latter by direct radiation. This is the principle of the usual type of indirect-arc furnaces. The arc does not come in direct contact with the metal, and the latter forms no part of the electric circuit. It is apparent that in this type of furnace the surface of the metal is not so seriously overheated as in the direct-arc furnace, but such overheating as exists is, nevertheless, too severe to permit the use of such furnaces in melting yellow brass. The indirect-arc furnaces can be used economically with alloys containing 5 to 10 per cent of zinc, possibly as high as 20 per cent, but certainly not for higher values.

The design of the indirect-arc furnace is invariably somewhat more complicated than is the case with the direct-arc furnace, and its thermal efficiency is not so high, but in the melting of copper alloys it can be economically used in large units and seems to be in general a more satisfactory tool for the purpose.

Several indirect-arc furnaces are now in use in this country for melting copper alloys which contain small percentages of zinc or none at all. In a new type of indirect-arc furnace the metal, as soon as it becomes molten, is agitated by rocking the furnace mechanically, in order to avoid overheating of the surface layer. In this way non-uniformity of heating is largely rectified, and it is possible that alloys high in zinc can be melted without excessive loss. The furnace has received a comprehensive commercial test, the results of which will be published soon. This type gives considerable promise of success and should be applicable to a wide field of alloy melting.

INDIRECT RESISTANCE FURNACES

Resistance furnaces which do not utilize the metal itself as an electric resistor may be grouped in three

classes: (1) those which radiate heat directly to the metal, similar in principle to the indirect-arc furnace; (2) those which radiate heat to the furnace roof and thence to the metal by reflection and secondary radiation; (3) those which deliver heat to the metal by conduction through a refractory wall.

Heating by direct radiation is the most desirable of the three from the standpoint of efficiency. For this purpose it is practically necessary to support the resistor above the bath in some manner, and this has never been done successfully in furnaces of any size. In small furnaces it has been possible to utilize this principle and to melt brass satisfactorily without overheating the surface of the metal to an undesirable degree, since, as compared with an arc, the resistor has a large area and operates at a much lower temperature. At the same melting speed the application of heat to the metal is more uniform but the efficiency is somewhat less.

MECHANICAL DIFFICULTIES PREVENT COMMERCIAL USE

This type of furnace is applicable to the melting of yellow brass but is not in commercial use because of the mechanical difficulties involved in its construction. The possibility of its eventual use depends upon the development of a resistor material which is at once highly refractory, homogeneous, mechanically strong at high temperatures and possessed of a fairly high electrical resistance at the working temperature of the furnace.

The second type of indirect resistance furnace named ranks next in order of thermal efficiency. In this design a refractory wall separates the resistor from the metal, although not necessarily in contact with the metal, and the major portion of the heat is radiated from the resistor to the furnace roof, the latter acting as a secondary heat source which reflects and radiates part of the heat which it receives to the bath beneath it. The heat has to travel a rather long path, and much of it is lost by the wayside. As a result the furnace is not so efficient in principle as those previously discussed. In order to stimulate a reasonably rapid flow of heat the resistor element must be much hotter than the roof, and the roof, in turn, much hotter than the metal. Thus the possibility of a high rate of production depends upon the use of a resistor capable of operating at a temperature very much above that of the metal, even at the pouring point. The furnace roof must be exceedingly refractory, and the brickwork in the immediate neighborhood of the resistor must be even more refractory than the roof.

This furnace, in common with other indirect resistance furnaces, has another disadvantage, somewhat minor in character but worth considering, which does not exist with direct-resistance furnaces, nor to any great degree with arc furnaces. The heat storage of the furnace is large and the stored heat is at a higher temperature than that of the metal. Consequently, the temperature of the metal will continue to increase after power has been shut off so that the metal must be poured promptly when it has reached the desired pouring temperature in order to avoid overheating.

This is the only form of indirect resistance furnace which has been used commercially for melting copper alloys. In its present form it is simple, reliable, easy to operate and can be used for practically any alloy, with either intermittent or continuous operation. Its metal-

lurgical characteristics are excellent, with the single exception that it is somewhat difficult to secure thorough mixing. It is also especially suitable for melting alloys high in zinc. However, its production rate is not rapid and it is not so efficient as the types of furnaces already described.

A similar type of furnace exists in which a combination of arcs and resistance elements is utilized, all radiating heat to the furnace roof, which, as in the furnace just described, serves as a secondary heat source. The use of arcs makes possible a considerably higher power input, more rapid melting and probably a slightly more favorable efficiency, provided that a sufficiently refractory roof is used. A very high efficiency cannot, however, be expected from this type of furnace. Certain difficulties in furnace design have been encountered which have so far postponed the commercial use of this furnace. It has been under test for some time, but the results obtained have not yet been made public.

The least efficient method of transferring heat from its source to the metal is to force it through a refractory wall, even though this wall be that of a clay-graphite crucible, a mixture which has a fairly high heat conductivity. Theoretically, the least undesirable arrangement under these conditions is to inclose the resistor in the refractory wall or to use the wall itself as a resistor. In the latter case the wall must be separated from the metal by an insulating layer to prevent short-circuiting. It is not an easy matter to make this insulation permanent, so this factor has been a serious source of difficulty. A resistor inclosed in a refractory wall tends to reach excessively high internal temperatures, and no material, satisfactory in other respects, has yet been found which will not destroy itself under these conditions. Another troublesome difficulty results from the ease with which most resistor materials unite chemically with the furnace refractories at high temperatures, thereby destroying both themselves and the refractories. Some two or three furnace types have been designed to make use of this principle, but they have been collectively unsuccessful. At present there is no real activity along this line.

CRUCIBLE FURNACE LOW IN THERMAL EFFICIENCY

Finally, it is possible to melt brass in a crucible by means of resistor elements which surround but do not touch the crucible. Perhaps the most perfect results, from a metallurgical standpoint, can be obtained in this manner, but the thermal efficiency is at a minimum, and in any case the electric crucible furnace lacks most of the secondary advantages upon which the electric brass-melting furnace must depend in part for its successful use. In cases where perfection of metallurgical results is by far the most important consideration it is possible that an electric crucible furnace can be employed profitably, but, so far as is known to the writer, no commercial installation of this kind exists.

So far as thermal efficiency is concerned, the crucible furnace takes its place at the bottom of the list. Its energy consumption per ton of metal produced is about three times that of the induction furnace. One or two attempts have been made to improve the efficiency but owing to the facts just stated its development has been discontinued.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Elementary Principles of Continuous-Current Armature Winding.—F. M. DENTON.—A continuation of the article classifying and explaining the nature of the various classes of continuous-current armature windings. The symbols used to designate the various windings, the choice of type of winding, effect of re-entrancy, definitions and winding rules are given in this section.—*London Electrician*, April 5, 1918.

Generation, Transmission and Distribution

Iron Wire for Transmission Lines.—W. T. RYAN.—The author deals with the cost of conductors and the relative advantages of iron and copper, quoting Kelvin's law for maximum economy. He points out that there is difficulty in determining the relative advantages of iron and copper on alternating-current circuits because the alternating-current resistance varies widely with the current and grade of wire. For long extra-high voltage lines aluminum is sometimes cheaper than copper. The Germans are reported to have discovered an alloy of zinc which combines ductility and toughness with fair electrical conductivity. In some cases they have even used iron wire covered with a double coating of varnish instead of the ordinary form of insulated wire. The article includes several curves.—Paper read before the Minnesota Electrical Association.

Transmission-Line Practice; Construction and Costs.—LIEUT. E. T. DRIVER and E. V. PANNELL.—The chief problems of engineering at the present day are economic ones. The different factors which affect cost in transmission-line work may be briefly summarized as follows: (1) Right-of-way, (a) easements or purchase, (b) clearing; (2) surveys and engineering; (3) material, (a) tower steel, (b) conductors and ground wire, (c) insulators, (d) hardware and equipment; (4) labor, (a) distributing material, (b) digging holes, (c) erecting, (d) setting insulators, (e) stringing wire and cleaning up; (5) interest; (6) contingencies. These factors are discussed. The article includes two charts showing metal costs.—*Toronto Electrical News*, May 1, 1918.

Installations, Systems and Appliances

Operating Features of Motor Drive in a Bakery.—The application of electricity for industrial cases and use for central-station service is coming more and more into use in various industrial plants. It is apparent that in a bakery the cleanliness and regulating features that can be had by the use of electricity are very great advantages.—*Electrical Review*, May 4, 1918.

Relation of Load Factor to Operating Cost of Electric Drive.—D. R. SHEARER.—Some of the factors which govern electric rates are the maximum demand for a specified period of time, the time during which the peak occurs, the time duration for the desired class of ser-

vice, the actual amount of electricity consumed over a stated time, and the power factor of the load if alternating current is used. All of these factors may be determined mechanically. The economies of different methods of drive, the questions to be considered in applying electric drive and an example of economy from rearrangement of motor drive are taken up.—*Electrical Review*, May 4, 1918.

Wires, Wiring and Conduits

Substitutes in the German Electrical Industry.—An article in *Engineering* gives some interesting particulars of the substitutes being adopted by the German electrical industry, as disclosed in a paper read before a meeting of Swedish Electricity Works representatives by M. T. Husberg. Early in 1914 copper, rubber and other raw materials were commandeered by the German government. The shortage in copper and its alloys has perhaps caused the greatest difficulty. Efforts have been made to substitute zinc for copper, and drawn wire of this material, which is relatively abundant, has been produced by a special squirting process at 500 atmospheric pressures. The brittleness and sensitiveness to change of temperature have, it is said, been much reduced, and it has been employed for busbar conductors of various kinds and even for machine windings. Aluminum and its alloys, although the supply available is limited because of extended use for airplane construction and other munition purposes, are also being employed, especially in the form of alloys, such as "electron" (10 per cent Al, 90 per cent Mg), "magnalium" (90 per cent Al, 10 per cent Mg) and "duralumin" (91 per cent Al, 9 per cent Cu). These alloys are used largely for busbars and castings where non-magnetic material is required. The shortage in rubber, cotton, jute, oil, asbestos and mica has also been pronounced. Paper has been used as a substitute and refined rubber residues substituted for rubber proper, while a substitute for ebonite is found in an artificial product of phenol and formaldehyde. For overhead conductors iron is chiefly used and special regulations are proposed for composite conductors (e.g., galvanized steel with an outer layer of zinc). Overhead lines of zinc alone are not likely to be used. Machines with substitute metals naturally have a relatively low efficiency, the efficiency of direct-current machines with zinc windings and iron commutator being given as 50 per cent, while transformers with zinc windings are credited with 60 per cent. Recently aluminum has been more generally used for machine windings, but even so an efficiency about 20 per cent below that of a machine of similar type with copper windings is experienced.—*London Electrician*, April 12, 1918.

Electrophysics and Magnetism

Sustained Short-Circuit Phenomena and Flux Distribution of Salient Pole Alternators.—N. S. DIAMANT

With the ordinary field forms met with in practice, the resultant flux wave under sustained short circuit will be extremely distorted because of the low voltage obtained under such conditions. The fundamental of the B curve of the field is reduced so much by the armature reaction that the higher harmonics assume a predominant part and become several hundred per cent of the sustained short-circuit fundamental. The flux distribution at various power factors is considered, and results of investigations to determine the direct component of armature reaction and the resultant flux distribution under sustained short-circuit conditions are given. The author thinks that the words "sudden" and "sustained" seem suitable for specifying the kind of short circuits applied, but the great difference between these two important and complex phenomena of sustained and sudden short circuits should not be lost sight of in any consideration of the subject.—*Proceedings A. I. E. E.*, May, 1918.

Units, Measurements and Instruments

Determination of the Degree of Uniformity of Bars for Magnetic Standards.—RAYMOND L. SANFORD.—Concrete magnetic standards, consisting of straight bars of magnetic material selected and prepared with a view to obtaining the maximum degree of homogeneity, are of very great value in magnetic testing. A method of determining their uniformity is described and curves are given showing the distribution of magnetic induction and leakage for various bars. The observations show the degree of magnetic uniformity that may be expected in ordinary test bars as received. Uniformity curves for a number of characteristic cast-iron bars are given and normal induction curves taken with the permeameter test coils over the different regions of the iron are illustrated.—*Bulletin of the Bureau of Standards*, April 6, 1918.

Study of Electromagnet Moving-Coil Galvanometers for Use in Alternating-Current Measurements.—ERNEST WEIBEL.—This instrument can be used very advantageously with iron in the fixed coil, which results in a marked increase in the strength of the magnetic field, so that the induced current is sufficient to effect satisfactory performance. The equation of motion, effects of reactance, determination of constants and disturbing torques are given in the theoretical section of the paper. In the construction and performance section the general design is discussed and also four separate types of galvanometers. The instrument is better than a vibration galvanometer and equal to the best direct-current moving-coil galvanometer. It also gives satisfactory performance at low frequencies.—*Bulletin of the Bureau of Standards*, April 6, 1918.

Miscellaneous

Heat Transmission of Building Materials.—A. C. WILLARD and L. C. LICHTY.—An investigation to determine the coefficients of heat transmission of standard building materials for exterior walls has been completed at the engineering experiment station of the University of Illinois. The tests were conducted according to the so-called "hot-air-box" method, the boxes being built of the material to be tested and of such size as to insure conditions similar to those found in actual practice. The heating was done electrically so that the input of heat could be controlled and accurately measured. The

materials tested included various sizes of plastered tile, magnesia board, cork board, wood, concrete, brick, glass with and without an air space, sheet asbestos and asbestos board. The degree to which the transmission coefficients of the various materials are affected by variations in air velocity, by humidity and by the use of air spaces in the wall is discussed, and the results of the tests are given in detail.—*Bulletin 102 of the Engineering Experiment Station of the University of Illinois*.

Electric Welding in Shipbuilding.—In the discussion on Capt. James Caldwell's paper on "Welding Systems," recently read before the Institution of Engineers and Shipbuilders in Scotland, various speakers especially well informed on the subject referred in definite terms to progress in electric welding as applied to shipbuilding. O. A. Payne, whose remarks had been prepared with the sanction of the Director of Naval Construction, gave the results of experimental work carried out at Portsmouth on plate connections in which there were riveted joints supplemented by runs of welding and plain electrically welded joints. One of the findings was that a plain butt V weld is quite as strong as, or stronger than, the best riveted joint attainable, whether riveted by hand, hydraulic or pneumatic machine, in double or treble rows. The general result of the experiments is that the Admiralty has accepted electric welding in full confidence as a shipyard method having great potentialities. When it is considered that the cost of an electrically welded joint is even now not much in excess of a riveted one, and that the process enables the output per man to be vastly increased—an important factor under existing circumstances—it is seen to be time that electrical welding be placed upon an approved basis in British shipyards, so as to be available at the slipway, dock side or the refitting berths. It can be used first on work of minor importance, such as calking, attaching fittings to water-tight bulkheads, etc., in order to gain experience in handling apparatus. Next it can be used to construct bulkheads flats, etc., with laps partly riveted and partly welded, proportionally reducing the connecting rivets. Finally, when full confidence in the use of the plant had been obtained, electric welding can be substituted to a large extent for the present laborious process of riveting, with great resultant gain.—*London Engineer*, April 12, 1918.

Tests on Oil Switches.—In an appendix to a paper by Dr. C. C. Garrard, read before the British Institution of Electrical Engineers, some interesting tests on the speed of operation of oil switches are reported. A number of tests were made by means of a rotating drum with a pencil mechanically connected to the moving portion of the switch. At the bottom of the drum two traces are made, one by a tuning fork vibrating at a rate of fifty times per second and the other by a marker connected across the trip coil. The latter exactly indicates when the tripping circuit is completed, and the tuning fork gives a time scale. The effect of the oil on the speed is very small, and with the spring in action the contacts separate at the rate of 4.7 ft. (1.43 m.) per second. After this velocity has been reached it remains practically constant during the rest of the movement. Without the oil the initial speed is 3.6 ft. (1.09 m.) per second, and if the spring is not used the speed recorded is not so great as this.—*London Electrician*, April 12, 1918.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities in the Technical, Commercial and Manufacturing Fields

PROGRAM FOR N. E. L. A. ATLANTIC CITY CONVENTION

Arrangements Now in Final Shape, and Sessions
Will Be Crowded with Vital Papers,
and Discussions

Arrangements for the war convention of the National Electric Light Association, to be held at the Hotel Traymore, Atlantic City, on June 13 and 14, are in final shape. The program is of direct importance and value to the electric utilities in their effort to use all resources and abilities to give service to the government.

The prospective program in detail follows. One or two other interesting items may be added:

FIRST SESSION

Thursday, June 13, 9.30 a. m.

Welcome to the city, Mayor Bacharach.

Presidential address, John W. Lieb.

Report of the treasurer, W. H. Atkins.

Report of the secretary, T. C. Martin.

Report of the membership committee, Walter Neumuller, chairman.

Reports of the national sections.

"Relationships Between the Government and Our Industry," discussion opened by Alex Dow, Detroit.

"War by Civilians," Arthur Wright, London, England.

SECOND SESSION

Thursday, June 13, 2.30 p. m.

Report of National Committee on Gas and Electric Service, George W. Elliott, secretary, Washington, D. C.

Report of National Committee on Public Utility Conditions, P. H. Gadsden, chairman, Charleston, S. C.

Report of public policy committee, W. W. Freeman, chairman, Cincinnati, Ohio.

Symposium on labor problems, participated in by Loyall A. Osborne, Washington, National Labor Board; D. H. McDougall, Toronto, president Canadian Electrical Association; Dr. Schuyler S. Wheeler, Ampere, N. J., president Crocker-Wheeler Company; James T. Hutchings, Rochester, N. Y., Rochester Railway & Light Company.

THIRD SESSION

Thursday, June 13, 6.30 p. m.

Informal dinner in the main dining room, Hotel Traymore, at which addresses will be made by Oscar T. Crosby, United States Treasury Department; P. B. Noyes, United States Fuel Administration; Samuel Insull, chairman Illinois Council of National Defense; Arthur Williams, federal Food Administrator for New York City; E. W. Rice, Jr., president General Electric Company, and W. W. Freeman, president Union Gas & Electric Company, Cincinnati.

FOURTH SESSION

Friday, June 14, 9.30 a. m.

Flag Day exercises.

Appointment of nominating committee.

"The Coal Situation," general discussion led by Past-president Herbert A. Wagner; "The Utilization of Water Powers as a Measure of Coal Conservation," Philip Torchio, New York Edison Company.

Technical Section subjects: (a) "Cable-Carrying Capacity Increase," (b) "Cable Reinstallations," (c) "Aerial

Cables," (d) "Female Employment in Laboratories," (e) "Extension of Testing Schedules," (f) "Increased Output from Existing Apparatus," (g) "Increasing Capacity of Overhead Distributing Lines," (h) "Interconnection and Power Requirements of Atlantic Seaboard District."

"Hydro-Turbine Efficiencies," W. W. Nichols, vice-president Allis-Chalmers Manufacturing Company, Milwaukee.

FIFTH SESSION

Friday, June 14, 2.30 p. m.

Vehicle Section subject, "The Electric Vehicle as a War Measure," James H. McGraw, New York City, president McGraw-Hill Company.

Commercial Section subjects: (a) "Results of Daylight-Saving Law," Preston S. Millar, New York Electrical Testing Laboratories; (b) "Peak Equalization," R. R. Young, Newark, N. J., Public Service Electric Company of New Jersey; (c) "Stimulating Appliance Sales," John G. Learned, Chicago, Public Service Company of Northern Illinois; (d) "Selling United States War Securities," T. I. Jones, Brooklyn, N. Y., Edison Electric Illuminating Company of Brooklyn.

Accounting Section subjects: (a) "Radical Accounting Practices," William Schmidt, Jr., Baltimore, Md.; (b) "Accounting Education," Fred R. Jenkins, Chicago, Ill.

Report of committee on memorials.

Report of nominating committee.

Election of officers.

SIXTH SESSION

Friday, June 14, 8.30 p. m.

"Emergency Construction for the War Department in United States," Col. Peter Junkersfeld.

"Emergency Shipbuilding at Hog Island," Past-president W. H. Blood, Jr.

Frank W. Smith, chairman of the hotel committee, 130 East Fifteenth Street, New York, urges delegates who have not yet secured hotel accommodations to communicate with him at once in order that arrangements for them may be made.

LIGHT LESS IN NEW YORK FOR ENEMY AIR RAIDERS

Experiment Made at Suggestion of the War Department Because of the Submarine Activities
of the Hun

New York city experimented with partly darkened streets on the night of June 4 as a precaution against possible bombing by aircraft from a German submarine. Electric signs and other commercial lights, except street and dwelling lighting, were out. The experiment was ordered by the police department at the suggestion of the War Department. United States aviators flew over the city to determine to what extent street lighting alone would guide enemy aircraft. As a result of the observations, these aviators recommended a reduction in street lighting on Fifth Avenue, Broadway and some cross streets. Their recommendations were put into effect and further observations followed.

NEED FOR CONSERVATION OF TECHNICAL ENGINEERS

Engineering Council, in Address to Secretaries of War and the Navy, Voices Alarm at Waste of Technical Training

An address to the Secretary of War and the Secretary of the Navy by the Engineering Council voices the alarm of technical engineers in every branch of the profession who are taking part in the war activities of the army and navy at the unfortunate waste of technical training caused by the drafting and enlisting of engineers for regular service with little or no regard for their technical attainments. These technically educated and experienced men are essential to the successful conduct of the war and cannot be replaced. There is continuing evidence that America is repeating in some measure England's mistake of sending technical men into the ranks when they should be carefully conserved for special duties in the fighting forces or on the technical staffs.

These facts have been forced upon the attention of engineers who have been co-operating with the government through the Naval Consulting Board, the National Research Council and the Engineering Council. To these organizations requests have constantly been made for engineers, chemists and other technical men for a great variety of military services. Thousands of names have thus been furnished to the government departments and bureaus. The Engineering Council especially has devoted attention to this personal work through its committee, known as the American Engineering Service, which has available classified lists of approximately 25,000 engineers and unclassified lists of many more. It is from these lists, directly or indirectly, that most of the names have been selected for war service.

The total membership represented by the organizations which constitute the Engineering Council or are co-operating with it in this service is approximately 50,000. Already from 10 to 15 per cent of the members of these several organizations are in the uniformed services of the country, and it is safe to say that a large majority of their remaining members are in the government civilian service or otherwise directly or indirectly engaged in the war. Engineers do not seek to avoid fighting, but earnestly desire to be given opportunities for fighting and other services in which they can be most effective and which cannot be performed by others.

It is known that, through the committee on classification of personnel in the war service exchange of the War Department and in some other ways, efforts are being made to counteract the tendency toward the loss of our technical men in the ranks of the army and navy. It is believed, however, that these efforts are insufficient and that they should at once be supplemented by other stringent measures dealing with the subject in the draft boards and recruiting stations.

In view of the foregoing, the Engineering Council, created to provide means for united action and to speak authoritatively for its member societies on all public questions of common interest to engineers, has offered the following resolution:

Whereas technically trained engineers are indispensable to the army, the navy and the war industries, in the Engi-

neering Corps, the Ordnance Bureau and the Signal Corps, in aviation, submarine and tank service, in shipbuilding and in many other assignments; and

Whereas, through draft and otherwise, many of these unreplaceable men have been and are being diverted so that their special qualifications are not being utilized, be it

Resolved, that, in the opinion of the Engineering Council, technically trained men of all ages should be enrolled and conserved for technical duties and special efforts should be made immediately by the War and Navy departments to find and record such men among drafted and enlisted forces and to assign them to places in which their special qualifications are needed, and be it further

Resolved, that the Engineering Council offers to assist the War and Navy departments in locating and classifying such men, if its assistance be desired, provided these departments will give the necessary facilities for collecting information about engineers now in the army and navy or whose names are upon the selective draft lists.

These resolutions are offered solely in a patriotic spirit of helpfulness, writes Alfred D. Flinn, secretary of the Engineering Council, in transmitting the address.

INDIANAPOLIS COMPANIES

ASK MORE RELIEF IN RATES

Two Properties Join in Petition to the Indiana Public Service Commission for New Authorization

The Indianapolis Light & Heat Company and the Merchants' Heat & Light Company of Indianapolis have petitioned the Indiana Public Service Commission for authority to add new surcharges to all bills for electrical energy, beginning on July 1. The two companies have been operating since last September under an order from the commission which allowed as a war emergency measure the addition to all bills of 5 mills for each kilowatt-hour of energy consumed. This first relief will expire June 30. The petitions, which the two competing companies filed jointly, have been set for joint hearing on June 17, 18 and 19 by the commission. One of the petitions says:

Petitioner represents and shows that since the filing of its said petition and the entry of the order made thereon there have been additional increases in the cost of coal, labor, material, taxes and other elements entering into the cost of the production and distribution of electric energy, and petitioner is of the opinion, from its experience and from extensive investigations made, that it will not be possible during the continuance of the war to purchase either coal, supplies, materials or labor except at prices greatly in excess of prices prevailing at the time of filing its said petition and the entry of the order made thereon, and that its taxes, both local and federal, have been greatly increased since said time and may be subject to still further increase.

Petitioner says that as a result of the foregoing increase in costs it has suffered serious loss in net revenue and will continue to suffer still greater losses which threaten to and will result in the curtailment of present service and the inability to finance necessary extensions and additions if sufficient temporary relief is not given in such a way as to return to petitioner the difference between the prevailing excessive prices and the normal prices upon which its existing rates and charges are based. That, as a temporary expedient to relieve the financial distress following the extraordinary prices as aforesaid and to make possible necessary betterments and extensions and prevent the curtailment of services, your honorable commission is requested to authorize petitioner to add to each bill rendered by it for all electric service furnished by it a surcharge sufficient to return to it the difference between the present excessive prices and the prices upon which its existing rates and charges are based.

Chester Station of the Philadelphia Electric Company

Philadelphia is in the very center of the country's war activities. The greatest shipbuilding plants, the largest munition works and other war industries are located there.

These all use the service of the Philadelphia Electric Company, and W. C. L. Eglin is rushing work on the company's new Chester station to provide 60,000 kw. more this fall.

NEW YORK EDISON RATES TO HOLD NOW

J. W. Lieb Shows Effect of Higher Costs and Reduced Gross Business Upon the Operating Income

At a hearing on June 3 before the New York Public Service Commission, J. W. Lieb, vice-president and general manager New York Edison Company, said that in spite of higher operating costs an increase in rates will not be asked at present.

Mr. Lieb said that the doubts and fears expressed by the company nearly a year ago in relation to a steady increase in the cost of manufacture had been realized. He added:

Our revenue has suffered a considerable decrease due to the reduction in rates, while our output has been actually less than last year. Our expense account has shown a steady increase as compared with last year in the price of coal and labor, and, in fact, in supplies of every description concerned with articles of consumption and those needed in repairs and maintenance.

Our records show that for the four months ended April 30, 1918, as compared with 1917, our operating income has been reduced from \$3,624,723 in 1917 to \$2,683,069 in 1918, a total of \$941,654 in the four months. Net income, therefore, suffered a serious decrease. What the future may have in store for us it is difficult to predict. In fact, with the rapid changes which are taking place we can only express our doubts and anxieties.

The loss in our operating revenue is not entirely accounted for by the reduction in the maximum rate from 7½ cents to 7 cents which went into effect July 1, 1917. It is disquieting, to say the least, that the reduction in the quantity of energy sold was from 223,061,388 kw.-hr. for the first four months of 1917 to 213,513,941 in 1918, a reduction in the output in excess of 4½ per cent.

The increase in operating expenses in 1918 and 1917 is a reflection of the increased cost of coal, of labor, supplies and taxes, and, with the exception of coal, the future price and efficiency of which is at this time problematical, these higher costs will continue, and possibly in an increasing ratio throughout the year. We believe that these conditions would justify the company in going back to the 8-cent rate. At the same time it is not absolutely certain that the decreases in output will continue for the rest of the year.

The present situation is one of extreme doubt and uncertainty. We do not desire to come before the commission at this time and announce our decision to restore the 8-cent rate. We believe that probably the best solution would be a continuation of the present arrangement with the commission, maintaining the status quo for another six months, and reserving such rights as we have under the present arrangement.

The commission agreed to this. The agreement affects practically all points in Manhattan and the Bronx and applies also to the United Electric Light & Power Company.

The company also announced that while it would continue to furnish lamps, it would be compelled to charge for them, and that the prices would be in line with the general increases made by the manufacturers.

WAR SERVICE WORK OF THE ELECTRIC POWER CLUB

Manufacturers of Power Apparatus, Meeting at Hot Springs, Va., Consider Questions Touching Service to the Government

War service and other matters related intimately to war conditions occupied much of the interesting program at the annual meeting of the Electric Power Club at the Homestead, Hot Springs, Va., on May 30 to June 1. The attitude of the manufacturers of power apparatus and of the government was the subject of discussion at special sessions to which all such manufacturers were invited, whether they were or were not members of the club.

As a representative of the government, Walter Robbins, chief of the power equipment section of the finished products division of the War Industries Board, showed the tremendous and fast-increasing scope of the nation's war mobilization. Robert K. Sheppard, chairman of the General War Service Committee of the Electrical Manufacturing Industry, outlined the spirit in which its work is being done and the patriotic need of the devotion of every resource to the one aim of winning the war. In addition, the address and remarks of C. L. Collens II, the president, and of others made plain the desire to give the fullest measure of support in the paramount cause.

PRESIDENT COLLENS ON STANDARDIZATION

At the opening meeting President Collens called attention to the permanent importance of the work of standardization, with which little was done last year because members gave their time to the war program. He said that standardization, however, had been the main work in the past and that it must still be a very important part. The handbook of standards is still far from complete and omissions should be supplied as the work can be done.

In his address at the meeting last fall Mr. Collens recommended that if possible the work of the club be broadened to endeavor to correct any bad practices in the industry, promote equitable competitive relations, and place the industry on a sound economic basis. He still feels that this ought to be undertaken, especially if it is done in full co-operation with a government agency. The club activities should be broadened so as to include commercial standards as well as the character of work done in the past.

President Collens then reviewed orders, rulings, etc., of the Federal Trade Commission affecting other industries, but which he felt were instructive as indicating the trend in the gradual development of properly defining what unfair competition is and the classes of bad practice which should be eliminated. Among these were the question of quality, so that there should be no room for misunderstanding by the public; contracts giving rebates based on volume of business, especially if contingent on the customer's refusal to deal with others; giving something to influence purchases; discrimination as to price, as in making prices very low or below cost in competitive territory.

Another point is the Federal Trade Commission's desire to compile statistics by industries. Mr. Collens believes with the commission that this is a function of the government and that the manufacturers should aid.

The possibilities of foreign trade under the Webb law should also be considered, added President Collens.

It was voted to remit the dues of all members in the national service.

At the evening session on May 30 reports were presented by the standing and standardization committees. A. H. Timmerman, chairman of the standardization committee, said that the fact that every one is working under the pressure of war conditions has materially handicapped further progress in standardization. Notwithstanding this, however, some excellent work has been done and the work should be continued.

Upon recommendation of the standardization committee it was decided to appoint as a sub-committee a safety committee to draw up safety rules. This committee will be entirely distinct from both the Underwriters' Laboratories and the Bureau of Standards.

Changes to classify the rules on dielectric tests, recommended by the committee on fractional-horsepower motors, were approved.

The general engineering recommendations committee presented the report of the conference committee of the American Institute of Electrical Engineers and the National Electric Light Association, making additions to the method of terminal marking on transformers. This was adopted, to go into effect not later than June 1, 1919.

Some discussion took place over the question of packing for foreign shipment, which has been taken up by the government from the point of view of saving ship space. It was also brought out, in connection with a reference to the bulletin issued recently by the General War Service Committee of the Electrical Manufacturing Industry, that the companies are making strenuous efforts to reduce tin consumption.

WORKING WITH THE WAR INDUSTRIES BOARD

At the first "war service session" on May 31 Walter Robbins, before taking up in detail the work with which he is in direct touch because of his position in the War Industries Board, gave a comprehensive picture of the great organization which has been developed to handle new governmental activities incident to the war, showing how bureaus had been expanded and new agencies created to deal with the large problems.

Mr. Robbins illustrated by one chart the general classification of purposes demanding preference treatment and by another the interrelations of the various divisions and committees of the War Industries Board.

The War Industries Board uses the committee form of operation, or conference system, which has been found to give the best co-ordination and results.

In showing the way in which the government necessities become greater and greater Mr. Robbins spoke of the pledge which the steel manufacturers have given, as follows:

For myself, my corporation or my firm, I pledge the prompt production and delivery of the largest possible quantity of material in our departments that is or shall be required by the United States government for the necessities of itself and its allies, and agree that all other lines of our business shall be subordinated to this pledge, and all this in accordance with the request of the War Industries Board.

In answer to a question, Mr. Robbins said that the zone system which is now under consideration was designed to facilitate the distribution of new needs to in-

dustries now operating on the less essential types and to facilitate the distribution of materials without useless transportation from district to district.

In general, the advice of Mr. Robbins is that each manufacturer begin now to satisfy himself that the work which he is doing is essential to the war. Every manufacturer should have his business so classified that he would know that which is essential or "non-essential" or in a middle class.

Robert K. Sheppard then told of the activities of the General War Service Committee of the Electrical Manufacturing Industry. He mentioned specific instances in which service has been given to the government and outlined the general attitude and purposes of the committee.

Speaking as chairman of the war service committee of the Electric Power Club, President Collens said that the power apparatus manufacturers co-operated with the War Industries Board some time ago in making a canvass which indicated that there were 15,000 motors

C. L. COLLENS, II

in stock in the country, and the disclosure of this fact eliminated the apparent shortage which existed at that time. The war service committee of the Electric Power Club has also assisted the General War Service Committee in organizing the power apparatus manufacturing branch of the industry into groups. Since the original organization of these groups four others have been added, electro-medical apparatus, radio apparatus, electric furnaces and electric welding. Organization of a group for electric storage battery manufacturers is now in a preliminary stage.

It is hoped to extend this, said Mr. Collens, so that in the end the electrical manufacturing industry will be organized 100 per cent. The effort will be to develop the efficiency of the group committees so that the general committee will be largely executive.

It was announced by Mr. Collens at the evening session on May 31 that the board of governors, after considering the reports on war service, had some preliminary recommendations to offer until more definite advice can be given. Each manufacturer should endeavor to determine as business is received into what class it falls regarding the war. Three classes of business are recognized as essential—direct government orders, indirect government orders, and work of exceptional or national importance which, while not directly

touching the war, is of great public interest and essential to public welfare.

It would be desirable to get a definite idea of the purposes for which apparatus not of these three classes is intended. If the order as received is not covered by a priority certificate, a written statement should be secured from the customer showing to what purpose it is to be put.

It is also recommended by the committee, added Mr. Collens, that manufacturers prepare immediately to tabulate data regarding needed raw materials, such as sheet steel, castings, bar steel, tool and alloy steels, copper wire, adhesive tapes, mica, fabrics, babbitt, solder and varnishes. Information should be prepared showing consumption last year and rate of monthly consumption now. As the nature of the business requires that power apparatus be manufactured for stock, there will have to be some agreement or guarantee that products will be reserved for essential war work.

It is desirable, Mr. Collens said, that each manufacturer study his own situation and if possible increase the percentage of his war work. Foreign orders should not be taken unless the necessary export license is secured.

F. S. Hunting and J. C. Hobart discussed the question of labor shortage and the employment of women.

S. L. Nicholson described experiences in transportation and embargo matters. A representative of the War Industries Board, T. C. Powell, is authorized to act to grant relief to manufacturers in these matters.

REPORT ON TRADE ACCEPTANCES

Mr. Hobart presented a report as chairman of the committee on trade acceptances, recommending the use of this system and showing the national economic advantages which make it especially desirable under war conditions. The report was adopted.

The first business at the concluding session on June 1 was the presentation of a report on handling freight claims, prepared in the secretary's office.

James Burke presented a paper on "Economies in Building Motors During the War." He urged full exchange of information and experience between manufacturers and every other form of effort to assure the largest possible economies of material and labor while the war lasts.

Dana Pierce, Underwriters' Laboratories, Inc., spoke on standards for control apparatus with reference to accident hazards. He asked the co-operation of the club in the preparation of standards which the Laboratories have been requested to compile for the National Workmen's Compensation Service Bureau. The matter was referred to the board of governors, which will act on it.

Dr. M. S. Lloyd, Bureau of Standards, spoke on the importance of the safety work.

H. F. Stratton, chairman of the cost accounting committee, reported that the club, as at present organized, does not include representatives who are specially concerned with cost accounting. The committee feels that the industry would be benefited by stabilization of cost accounting and recommends enlargement of the functions of the club.

O. F. Stroman delivered an address on "Variations in Manufacturing and Commercial Cost," with diagrams. He showed a method of determining the ef-

feet on manufacturing costs of market changes in basic costs.

J. C. Hobart, member of the war service committee, reported on fuel supply and conservation. He indicated the shortage in production below consumption demands and urged that every one inspect his methods of burning fuel.

F. M. Kimball, W. A. Layman, J. C. Hobart and S. L. Nicholson were elected directors. At the ensuing meeting of the board of governors officers were elected for the new year as follows:

President, Clarence L. Collens II, Cleveland; vice-president, James Burke, Erie, Pa.; secretary, C. H. Roth, Chicago; treasurer, R. J. Russell, St. Louis.

JOBBER TO CO-OPERATE WITH THE CONTRACTORS

Resolution Passed by the Electrical Supply Jobbers' Association as a Result of Conference of Committees

At the request of the National Association of Electrical Contractors and Dealers the co-operation and harmony committee of the Electrical Supply Jobbers' Association met a committee of three contractors, appointed by the contractors' association at the Homestead, Hot Springs, Va., on May 19, 1918. The following were present, representing the contractors' association: W. K. Tuohey, Springfield, Mass., chairman; J. R. Strong, New York; G. M. Sanborn, Indianapolis. Representing the jobbers there were W. E. Robertson, chairman; F. S. Price, N. G. Harvey, F. M. Bernardin, E. W. Rockafellow, Fred Bissell, V. C. B. Wetmore (by invitation), F. Overbagh, F. E. Neagle and E. D. Tolles.

After a full discussion of the problems confronting the electrical contractors, a request was made by them summarized as follows:

That the jobbers aid the contractors' association to increase its membership by, personally and through salesmen, urging contractors not members to join the association.

That in the same way the jobbers urge retail electrical dealers, hardware and other stores operating retail electrical departments to become associate members, and that jobbers operating retail departments also join the association, to the end that a far-reaching, properly financed campaign of education as to cost accounting and proper merchandising methods may be carried on, resulting in making the contractors better business men and merchants and larger and better customers of the jobbers, with a corresponding improvement in the credit risk involved.

That the jobbers' association appoint a committee to attend the national meeting of the contractors' association at Cleveland in July and that this committee, preferably of three, meet a similar committee of contractors to confer from time to time with reference to matters of mutual interest.

As a result of the meeting of the committees, the following resolution was passed by the Electrical Supply Jobbers' Association:

Your committee, in accordance with the objects expressed in the constitution of this association, believes that we should forward, by co-operative action, improvement in all

lines that will benefit the electrical industry and therefore recommends:

First—That all members of the jobbers' association having retail departments become associate members of the contractors' association.

Second—That the members of the association personally and through their salesmen urge all electrical contractors and electrical contractor-dealers to become members of the contractors' association, and urge all electrical dealers and all other merchants operating retail electrical departments to become associate members.

As there seems to be some misunderstanding as to the meaning of the term "retail department" or "retail business," the following definition, to avoid misunderstanding on the part of jobbers not present, is given:

By retail departments operated by jobbers your committee understands the term to cover departments that sell at retail prices, in retail quantities, to the consumer, and expressly excludes sales to isolated plants, central stations and power companies, philanthropic, educational, health or corrective institutions or enterprises related thereto; industrial firms or corporations of every kind engaged in commerce or in undertakings relating thereto; the government or any political subdivision thereof or agency in connection therewith.

Third—That the invitation to attend the national convention in July be accepted, and that the chairman of the co-operation and harmony committee designate three members of the committee to attend.

THE KANSAS CITY CENTRAL STATION RATE SITUATION

Analysis of Conditions That Make an Increase in Charges Necessary and a Statement of What the Company Is Asking For

In May, 1917, the Missouri Public Service Commission reduced the rates of the Kansas City (Mo.) Light & Power Company. At that time the commission decided to allow the Kansas City company to earn 6½ per cent on a valuation of \$7,200,000. A rate schedule was made effective which it was expected would give the company the stipulated return.

Prevalence of high prices and constant increase in cost of labor and material during the year have prevented the company from getting the net return expected. The earnings have fallen \$300,000 short of the allowable amount. During the same time a reduction in steam-heating rates was made effective. This has added further burdens to the company, and if these heating rates are effective during the coming winter the company's heating revenue will be reduced \$100,000. But, in addition to all this, the rate which the Kansas City Light & Power Company pays the Kansas City Railways for electricity which it buys to distribute has been increased by the commission by an amount that means an added annual expenditure of \$400,000 to the electric light company. The rate was formerly 1 cent per kilowatt-hour. It was increased to \$15 per kilowatt of maximum demand and 1.14 cents per kilowatt-hour.

So in the aggregate the company stands to-day with \$300,000 less than the commission expressed willingness to allow it and also in a situation where it will see revenues reduced and expenses increased. The shortage for the coming year, unless some relief is granted, will be in round figures \$800,000, in addition to the existing shortage of \$300,000.

The company has asked the commission for this relief in the shape of an increase in electric service rates.

The approximate amount of the increase asked is \$500,000. The application to secure this increase in revenue contains two plans either of which the company considers satisfactory.

One plan contemplates an increase in all rate schedules in an amount equal to about 1 cent per kilowatt-hour. This applies to both power and light. At present the top step in the residential rate is 8 cents.

The other plan is a combination of the surcharge and straight increase ideas. Under the terms of this plan the company asks a surcharge of 7 cents per room per month against residential consumers; a surcharge of

The 1917 Light, Heat and Power Rates Failed to Meet the Fixed Expenses.

"It Is Essential Public Utilities Be Maintained"

Under an order made by the Missouri Public Service Commission the present schedule of rates—a reduction of the former rates—was placed in effect by us May 1, 1917.

These rates were based on pre-war prices and were to be given a trial for one year. They were made in good faith to meet the requirements of the Commission, and were calculated to bring the service given by this Company to the consumer at the actual cost of delivery plus a FAIR RETURN on the actual investment.

Since May 1, 1917, we have increased the wages of our employes \$155,000, over 46 per cent as compared with a year ago. Most of this increase has been made during the last six months.

In the same period materials used by this Company have advanced \$90,000; a 30 per cent increase; fuel advanced more than \$200,000 or 57 per cent above a year ago; our tax increase was \$56,750, an increase of 53½ per cent.

With the advances in fuel, labor, materials and taxes the rates fixed failed to produce sufficient revenue to meet the expenses by approximately \$300,000 (\$265,000 for eleven months).

During the same time our heating rates were reduced, which, if in effect during the coming winter, will decrease our revenue from that source more than \$100,000.

Most of the electric current used by us is purchased outside our own plants. Under the recent finding of the Public Service Commission the same amount of current purchased this year as purchased in 1917 will cost us \$400,000 more during 1918 than in 1917 under the present coal prices. This means the Company is now facing a deficit during the current year of approximately \$800,000.

The rate which has been fixed for light, heat and power service in Kansas City will not meet the cost of supplying that service. It will not pay the increases in labor, fuel and materials, to say nothing about a fair return on the money invested in the property.

The Kansas City Light & Power Company

HOW THE KANSAS CITY COMPANY TALKED TO THE PEOPLE

\$1 per kilowatt of connected load per month on commercial consumers, and an increase of 25 cents per month per kilowatt of demand on an increase of 1½ cent in the energy rate for power customers.

No change in the municipal lighting rate is asked.

In preparation for the pending hearing on its application for increased rates the company has conducted an advertising campaign in the daily papers. This advertising is written in a vein of frankness and sincerity. It sets forth that the company is supplying power to many essential war industries and that it is therefore essential and must be maintained. President Wilson's correspondence with Secretary McAdoo is quoted. Facts and figures from the company's books are also used to show that the company has not made the money which the commission said it is entitled to make.

IOWA ASSOCIATION DISCUSSES PROBLEMS OF VARIOUS SORTS

Methods of Holding Labor, Securing Higher Rates and Saving Coal Are Topics of Two-Day Round-Table Discussion

On May 31 and June 1 the Iowa Section of the National Electric Light Association held at Des Moines its first convention since the declaration of war. About fifty operating men, most of whom are responsible heads of properties, were in attendance. The convention was noticeably different from those in former years because of its entire lack of entertainment features and the absence of set papers. The program, as laid out, provided only for discussions of topics which are now uppermost in the minds of all utility men. The convention was also notable for the wealth of valuable discussion which its more or less informal sessions developed.

President John M. Drabelle, in addressing the first session, dwelt at length on the increasing cost of giving service and the difficulty of keeping sufficient labor. He expressed the belief that interconnection of plants and the shutting down of inefficient stations could be carried still further with beneficial results. As a suggestion to companies which are having trouble in getting local city councils to agree to proper rate increases, he advised that recourse be had to the federal courts. He also stated that, in figuring rates, companies should revise their ideas of interest and fixed charges.

A round-table experience meeting on the labor situation brought out that difficulties in getting and keeping plant men are extraordinary. It was the opinion that it is cheaper to pay more, to firemen especially, than to change frequently. In Iowa wages for firemen and engineers are now ranging between \$80 and \$100 a month for shifts from eight hours to twelve hours long. On the question of hiring women it was agreed that it is wise to begin immediately, if the plan has not already been adopted, to replace with women men who leave, so that it will be possible to get into the woman labor market while conditions are favorable. While only one man present had had experience with women as meter readers, many seemed to think they would soon be using women in this work.

F. A. Warfield of Peoria, Ill., leading the discussion on rates, told how the properties of the Illinois Traction System had recently secured an increase amounting to 18 per cent. He also emphasized the national aspect of the present tendency to ask for increased rates and pointed out that it is as much to the interest of communities as to utilities that relief be granted to afflicted companies. He declared the present rate situation to be a test of commission regulation. The discussion brought out that many rate increases have been effected in Iowa. These have amounted to an average of about 20 per cent, but some rates will have to be raised a second time. Even in communities paying 16 cents for energy the price has been raised to 20 cents per kilowatt-hour.

Next in point of interest to the question of getting more revenue was that of reducing operating expense. This program, it was conceded, should start in the boiler room. E. S. Hight of Peoria, in leading the discussion, stated that a boiler-room economy department of the Illinois Traction System had saved the company

\$239,000 in six years by simply seeing that the obvious sources of loss were stopped.

Frank Linebaugh of Boone, Iowa, speaking on the coal situation, urged early purchase and storage. "No all-wise authority," he said, "is going to take care of central stations this winter. They must help themselves by storing clean lump coal if the other grades they can secure do not permit successful storage." Mr. Linebaugh also advised that managers study the relative cost of operating on mine-run coal and steam coal. In many instances it will be learned that the higher-priced coals are least expensive in the long run. While coals which contain lumps require crushing, Mr. Linebaugh said plants should have crushers anyhow for emergency work.

Those who took prominent part in the various round-table discussions were: W. H. Abbott, Omaha, Neb.; R. H. Holbrook, Cedar Rapids; H. Simonds, Dubuque; M. G. Linn, Des Moines; R. C. Clifton, Idagrove; E. T. Hughes, Sheldon; John M. Drabelle, Cedar Rapids; Harold Boehner, Malvern; J. W. Walsh, Burlington; R. E. Brooks, Red Oak; C. E. Fahrney, Ottumwa; C. O. Ingersoll, Marion; L. C. Spake, Chicago, and Mr. Ham-lon, Mason City.

Officers elected for the ensuing year are: President, Herbert Bellamy, secretary Marion County Electric Company, Knoxville, Iowa; vice-president, O. H. Simonds, Dubuque; secretary-treasurer, M. G. Linn, Des Moines; assistant secretary-treasurer, Ira Steel, Des Moines, and director, John M. Drabelle, Cedar Rapids.

EXEMPTION PROVIDED FOR TECHNICALLY TRAINED MEN

Highly Skilled Enlisted Men Are to Be Returned
to Necessary Industries by the
War Department

In response to appeals from all over the country, the War Department has decided upon a policy which will permit the return to necessary industries of highly skilled men taken from such industries, under a system of furlough which will be automatic and which will not in the future as in the past leave to the discretion of company and other subordinate commanders the question of whether such furloughs shall be granted. Thousands of applications for such furloughs are now being sent out of Washington by various branches of the War Department, in response to the appeals of manufacturers and other producers of war material whose draftsmen, mechanics and other employees, engaged in the past and now upon government orders for war work, have been taken from them by operation of the draft.

The application blank is reproduced here.

The adoption of the new policy means that enlisted men are to be returned to industry only in cases where the drafted man's employer is willing to swear that the man is badly needed and that no one can take his place. The government department for which the manufacturer or other employer is working will, upon application, send one of the blank forms to the employer, which he must fill out, swear to before a notary and have a government inspector conversant with the facts also sign. The signed application then goes to the Adjutant General's office, with request from the in-

terested government department that the man wanted be granted an indefinite furlough, without pay, with the promise that after the need for the man's service has passed he will be returned to the army and the government notified.

While such men are on furlough they are not to be allowed to wear the uniform. The company employing such men must furnish to the government each month a report that such men are still in employment and of the class of work in which they are engaged. In case

APPLICATION FOR RETURN OF ENLISTED MAN IN HIGHLY SKILLED CLASS OF LABOR TO "NECESSARY" INDUSTRY

Dated at.....191

Application is hereby made for the return of following enlisted man:

such men leave their employment the employers must immediately notify the government.

Thousands of applications for furloughs for enlisted men in necessary industries have recently reached Washington, and Washington has been unable to grant permission for the necessary furloughs because company commanders and other subordinate officers could not be convinced that certain of their men might be more necessary in civil life than in the ranks. The Adjutant General's office has now sent a circular to heads of War Department divisions permitting the new system. The government is protected, from the army-in-the-ranks point of view, by the fact that wherever a fraud is perpetrated or an attempt is made to perpetrate fraud enough persons will be familiar with the facts to result in the War Department being notified.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Electrical League of Cleveland.—William T. Clark, a Civil War and Spanish War veteran, talked before the Electrical League of Cleveland on Wednesday, May 29.

N. E. L. A., Toledo Section.—At a meeting of the members of the joint section of the Toledo Railways & Light Company and Associates held May 24 G. E. Snider was elected chairman and G. E. Lafferty secretary.

A. I. E. E., Erie Section.—The Erie (Pa.) Section of the American Institute of Electrical Engineers held a meeting on May 23, at which the subject of discussion was "The Part Electricity Is Taking in the World War."

New York Electrical Society.—The annual meeting of the New York Electrical Society for the election of officers was held in the board room of the National Electric Light Association, in the Engineering Societies Building, New York, on June 6.

San Francisco Electrical Development League.—At the May 29 meeting of the San Francisco Electrical Development League D. C. Nutting, superintendent construction of the navy at the Union Iron Works, San Francisco, spoke on "How Shipbuilders Are Helping to Win the War."

A. I. E. E., Spokane Section.—The annual session of the Spokane (Wash.) Section of the American Institute of Electrical Engineers was held on May 17. Prof. M. K. Akers spoke on "The Fundamental Mathematics of Alternating-Current Circuits," and P. T. Acland of the Forty-eighth Highlanders of Canada gave his "Recollections of Ypres Salient."

Electrical Dealers and Contractors of Tennessee, Mississippi and Arkansas.—On May 27 and 28 the Electrical Dealers and Contractors of Tennessee, Mississippi and Arkansas held a meeting in Memphis. W. L. Goodwin gave a talk on "The Science of Electrical Merchandise." General trade topics were discussed at the meeting, and the aviation camp at Millington, which is near Memphis, was visited by the members attending the meeting.

A. I. E. E., Portland Section.—The last meeting of the Portland Section of the American Institute of Electrical Engineers was held on June 4 at Crown Point on the Columbia Highway. O. F. Stafford, head of the department of chemistry at the University of Oregon, addressed the meeting on "Utilization of Waste Wood in Two New Processes." The apparatus described was developed at the University of Oregon for producing distillation products and high B.t.u. gas.

Society of Automotive Engineers.—There will be a meeting of the Society of Automotive Engineers at Dayton, Ohio, on June 17 and 18. The papers will be on subjects such as refining of petroleum, aeronautic engineering, tractor engineering and the design of heavy fuel engines.

National District Heating Association.—Although there will be no regular convention of the National District Heating Association this year, it has been decided that the executive committee, together with the chairmen of the standing committees and as many members as possible, will hold a meeting at the Breakers Hotel, Cedar Point, Ohio, July 8 and 9, to discuss various matters now affecting the heating companies and to receive the reports of the standing committees for the year.

National Association of Manufacturers.—Among the important papers presented before the twenty-third annual meeting of the National Association of Manufacturers at New York were "Export Trade During War Time," by H. B. van Sinderen, director Bureau of Exports, Washington, D. C.; "France and Her Industrial Needs," by Charles F. Beach of Paris; "Combinations for Foreign Trade," by N. B. Williams, Washington, D. C., and "Trade Acceptances and the Manufacturer," by W. M. Nones, Norma Company, New York.

A. I. E. E., San Francisco Section.—At the May 24 meeting of the San Francisco Section of the American Institute of Electrical Engineers Lieut. William S. Leffler, reserve military aviator, described the training given to combat flyers. Before entering the air service Lieut. Leffler was assistant to W. W. Briggs of the Great Western Power Company. Lieutenant Flynn of the British Royal Flying Corps, an instructor at the Fort Worth (Tex.) flying school, also spoke on the work of the air service. J. W. Beckman of the Beckman-Linden Company, read a paper on "Electrochemistry and the Power Industry."

Providence Engineering Society.—The importance of thermal insulation as a factor in coal saving in steam plants under present conditions was emphasized at a recent meeting of the Providence (R. I.) Engineering Society in a paper by L. B. McMillan, consulting engineer, general power specialties department, H. W. Johns-Manville Company, New York. At present fuel costs, the author said, the losses of heat encountered in uninsulated pipe and fittings are very serious. The loss of heat per square foot of bare pipe at 100 lb. pressure may easily represent the equivalent of more than one-third of a ton of coal per year at the pipe surface alone, or more than one-half ton at 150 lb. The loss at the coal pile itself may be five or ten times as great. More attention should be given to insulating pipe flanges than in the past. A 10-in. bare flange at ordinary steam-plant pressures like the above may cost more than a ton of coal per year in fuel loss. From 80 to 90 per cent of these losses can be prevented.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Wires Accessible to Boys.—Electric companies stretching wires through trees which children can climb must anticipate their presence in such trees, and where a boy climbed from a building into a tree and a twig broke and he fell against electric company's uninsulated wires and was injured, the company was liable, the Supreme Court of Missouri held in *Williams versus Springfield Gas & Electric Company* (202 S. W. 1). Where a boy playing upon a building belonging to another party by owner's sufferance climbed upon a tree either on such party's premises or in an alley and while there was injured by defendant's uninsulated wires, such boy was not a trespasser as to defendant. Where plaintiff, a boy, climbed into a tree and slipped or fell, because of the breaking of a twig, against defendant's uninsulated wires passing through the tree, and there was no evidence that he knew of the defect of the insulation or that he purposely touched the wires, contributory negligence is not shown.

Validity of Municipal Contract with Competing Utility.—The act of the Georgia General Assembly empowering the board of lights and waterworks for the city of Marietta to "take the proceeds of any bonds sold for the purpose of creating a system of waterworks and build and erect such waterworks for the best advantage of the city," and to this end, if thought proper, to "purchase and acquire any property now owned and operated by any other company," and to "make all contracts for the lights and water supply for the city of Marietta," did not authorize such board, after it had built and equipped an electric light and waterworks plant, to pay \$15,000 to a competing plant to "quit operating its electric light plant in the city," where, under the contract, the board obtained nothing in the way of plant, poles, wire or other property of any kind from the selling company, and where the consideration was not money arising from authorized sale of bonds, but where part of the purchase price was to be met by unauthorized borrowed money and a new debt created for the remainder, payable in notes due beyond the year in which they were executed. In the opinion of the Supreme Court of Georgia (95 S. E. 7) such contract is illegal and the payment of such notes can be enjoined at the instance of a taxpayer of the municipality. This ruling above makes it unnecessary to decide whether the contract would have been legal had the consideration therefor been obtained from the sale of the bonds authorized by the act.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

San Diego Company Now Employing Water Power.—On May 21 connection was made with the Southern California Edison Company's transmission lines at San Juan Capistrano, and the San Diego Consolidated Gas & Electric Company is now purchasing a considerable part of its electric energy requirements from the Southern California Edison Company, whose electricity is largely developed by water power.

War-Time Strikes on War Utilities.—Commenting on the threatened strike of the Western Union telegraphers, the New York Times says in an editorial: "Public utility strikes differ from other strikes in that the rights of the public are superior to those of either party to the strike. Capital is not compelled to invest in public utility undertakings, but if it does invest it invests with knowledge that the investment is subject to continuous service of the public. There should be the same understanding on the part of labor. . . . There should be no reluctance to meet the issue. It will not grow less if dallied with. The right to unionize, the right to bargain collectively, the right to improve conditions of employment, are all subordinate to the right of the public to have uninterrupted public service. If there should be a strike so obviously in the interest of the enemy, there should be the strictest inquiry into any concealed motive for the strike, and punishment fit for any such disclosure of treachery."

Change of Rates Sanctioned in San Bernardino, Cal.—The California Railroad Commission has authorized the Southern Sierras Power Company and the Southern California Edison Company to change their electric lighting rates for domestic and commercial service to consumers in San Bernardino. This revision of the previous rates fixed by the commission will reduce the rates to residence and large commercial lighting consumers, while the rest of the rates will remain as formerly fixed. The company asked for the change. The new rates are as follows for both companies: First 100 kw.-hr. a month, 7 cents per kilowatt-hour; next 200 kw.-hr. a month, 6½ cents per kilowatt-hour; next 500 kw.-hr. a month, 5½ cents per kilowatt-hour; next 1000 kw.-hr. a month, 5 cents per kilowatt-hour; next 1000 kw.-hr. a month, 4 cents per kilowatt-hour; next 2000 kw.-hr. a month, 3 cents per kilowatt-hour. All energy used in excess of 5000 kw.-hr. a month is to be billed at 2½ cents per kilowatt-hour; minimum monthly bill, 75 cents.

The Doherty Fraternity Plan.—The initial plan for a Doherty fraternity, to be known as "The Doherty Men," has been prepared by a committee of which George Williams of New York is chairman. It is proposed that there be a central organization which shall grant charters to subsidiary bodies on their petition. The general purposes of the fraternity, it is stated, are to foster patriotism, to promote the interests of Doherty men and their families, and to perpetuate and develop the business ideals of Henry L. Doherty. Different classes of membership are contemplated.

Hartland Power Company.—The Hartland Power Company was organized several months ago as an independent public utility operation by W. S. Barstow & Company, New York, and Steel, Jones & Company, bankers, Philadelphia, to supply power to West Virginia coal mines. The plant of the company is at Hartland, on the Elk River, West Virginia, the center of the new coal-mining activities, and consists of 1000-kw. General Electric steam turbines, complete with condensers, boilers, etc. Construction work is now completed, the organizers state, and within the next ten days the company will start operation. Transmission lines have been built up Middle Creek to the coal mines in the section and are being extended to other nearby developments. The coal operators are rapidly installing modern electrical machinery and a number of them are ready for power. Within a radius of four miles of the power plant there are some ten or twelve large coal-mining developments. The Coal & Coke Railroad, running along the Elk River Valley, passes through the center of the field and is equipped with adequate facilities for handling a large output.

Officers for Submarine Duty Needed.—Lieut. Commander Conant Taylor, U. S. N., calls attention to the fact that the submarine force of the United States Navy requires the services as officers on board submarines of young men who have had technical training and experience in mechanical and electrical engineering. It is intended to enroll a number of such men as provisional ensigns in the Naval Reserve force, give them a course of instruction in deck duties at Annapolis and a course in submarine work at New London. Those who successfully pass these courses will then be sent on board submarines for regular duty. Candidates with the degree of M. E., E. E. or E. M., who have had two and a half years' practical experience in their profession and are not over thirty-five years old and physically strong and sound, should apply to the commander of the submarine force, U. S. S. Chicago, care of Postmaster, New York. The indorsement of one of the following organizations is desirable but not obligatory: Naval Consulting Board, National Research Council, American Society of Mechanical Engineers, American Institute of Electrical Engineers and American Institute of Mining Engineers.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Rates of Return in Illinois.—The Illinois Public Utilities Commission, in a decision affecting the Citizens' Gas, Electric & Heating Company, Mount Vernon, allowed a return of 6½ per cent for gas property which appeared undeveloped, 8 per cent for electric property which seemed efficiently managed, 7 per cent for water property and 6 per cent for heating property which appeared ill-advisedly located. The commission believed, in considering the reproduction cost of utility property, that it would be just and proper that the value of utility land should reflect proportionate increases of value as shown to exist in adjacent and comparable property.

Rate-Making Practices in Illinois.—Authorizing an increase in electric rates by the Lena Electric Light & Power Company, the Illinois Public Utilities Commission comments on rate-making practices as follows: "It appears from the record that the company in the past has charged certain consumers at flat rates for power service. These consumers in some cases have been large users of power. In addition to these power consumers several lighting consumers have been charged at flat rates. This practice must be discontinued in the future and all rates must conform to the schedules on file. The commission has frequently expressed itself regarding flat rates when applied to consumers who have the opportunity to waste energy. In the case of very small light consumers whose monthly bills would scarcely justify the installation of a meter there appears to be a legitimate demand for flat-rate service. For a small plant, and particularly in case it does not operate twenty-four hours per day, it would appear that the advantages of such a rate more than offset its theoretical disadvantages. Such a rate will be provided in the schedule hereinafter ordered. The records of the company have not been well maintained. No records are available showing the energy supplied for municipal pumping or for some of the largest power consumers; neither are there means provided for obtaining the total energy generated. The order will provide for maintaining more complete records. The rates filed by the company contemplate a monthly minimum bill for lighting service of \$1.25 per month per consumer. This amount is unusual for a community of this size, and in the absence of proof as to any peculiarity of conditions which would make the cost of service to small consumers unusually expensive the commission will not authorize an increase in the present minimum bill, which is \$1 per month."

H. N. Slaughter, lieutenant-colonel in the Signal Corps, engaged in the development of radio apparatus for all branches of the army, was research engineer for the Western Electric Company on radio-telephone work for a year and a half prior to entering the Signal Corps. He was born March 17, 1888, at Danville, Va., and at the age of twenty was graduated from the Georgia School of Technology with the degree of B. S. in electrical engineer-

H. N. SLAUGHTER

ing. For three years he taught electrical engineering at Pennsylvania State College. The next three and a half years were spent with the Marconi Wireless Telegraph Company in England and in Hawaii. When in Hawaii he was in charge of construction and operation of one of the world's largest radio stations. He then entered the employ of the Western Electric Company. In April, 1917, he was commissioned as major in the Signal Reserve Corps to take charge of development of radio apparatus and in December was promoted to lieutenant-colonel.

James T. White, manager for the Oregon Gas & Electric Company at Roseburg, Ore., has been appointed to succeed O. R. C. Grow, resigned, as manager at Medford, Ore.

Henry G. Kobick, who has been with the Commonwealth Edison Company of Chicago for the last nine years, has resigned his position as superintendent of employment bureau to enter the aviation section of the Signal Corps, United States Army.

Arthur H. Savage, newly elected president of the South Dakota Electric Power Association, is a resident of St. Paul, Minn., and is treasurer of the Dakota Light & Power Company. He organized this company in 1912, and it commenced operations in August of that year, supplying the city of Flandreau, S. D. Mr. Savage was for thirteen years in charge of the Northwestern district as representative of the Fort Wayne Electric Works, severing his connection with that concern in 1914. He has since then been a manufacturer's agent for the sale of electrical machinery and central-station power plants.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Ralph E. Harris has been appointed successor to George W. Scott, resigned, as superintendent of the Warrenton (Ga.) municipal light and power plant.

J. A. Harnett, electrical engineer with the Western States Gas & Electric Company, has resigned to become connected with the Southern California Edison Company.

L. J. Porter has resigned as superintendent of the municipal water and light plant at Sandersville, Ga., to take charge of the municipal water and light plant at Waynesboro, Ga.

Charles H. Maxfield, superintendent of the Dexter district of the Central Maine Power Company, has taken charge of the Dover-Foxcroft office, of which W. G. Parker was formerly in charge.

A. D. Mackie, general manager of the Springfield (Ill.) Gas & Electric Company, has been appointed by Governor Lowden as a captain of infantry in the Fifth Regiment, Illinois Reserve Militia.

R. H. McKibbin, who has been with the Cerro de Pasco Mining Company at Pachachaca, Peru, for the past year on hydroelectric construction, is now electrical engineer for the Southwest Cotton Company at Phoenix, Ariz.

Fay Griffith, who has been superintendent of the lighting department of the Little Rock (Ark.) Railway & Electric Company, has been promoted to be superintendent of light and power and has taken over both the meter and line departments.

Clarence K. Beilharz, engineer in charge of operation of the steam and electrical plants of the Northwestern Ohio Light Company and for six years manager of the company at Delphos, Ohio, has been appointed manager of the Alva (Okla.) Light & Power Company.

A. A. Brown, formerly sales manager of the St. Paul division of the Northern States Power Company, who received a commission as first lieutenant on completion of the second Officers' Reserve training camp course, has been promoted to a captaincy and transferred to the Seventh Division engineers, Waco, Tex.

Ex-Senator John W. Slocum of Monmouth, N. J., has been elected president of the Board of Public Utility Commissioners, succeeding Lieut. Col. Ralph W. E. Donges, who recently resigned to devote his entire time to his duties as a member of the War Department Board of Appraisers. Mr. Slocum has been acting president of the commission.

D. C. Green, the president-elect of the Arkansas Public Utilities Association, is vice-president and general manager of the Fort Smith (Ark.) Light & Traction Company. Mr. Green was graduated from Purdue University with the class of 1908. After a brief experience with the Allis-Chalmers Company in its Cincinnati works he became associated with H. M. Byllesby & Company of Chicago. His experience with the Byllesby company has in-

D. C. GREEN

cluded such positions as manager of new business at San Diego, Cal., and manager at Albany, Ore., Marshfield, Ore., Everett, Wash., and Fort Smith, Ark. Mr. Green has been with the Byllesby organizations continuously since his first affiliation with them except for a period of about one year when he was connected with the Electric Bond & Share Company at Salt Lake City, Utah.

Malcolm G. Chace of Providence, R. I., has been appointed Fuel Administrator for Rhode Island, succeeding George H. Holmes, resigned. Mr. Chace is a partner in the firm of Chace & Harriman, Boston, which has developed from their inception the hydroelectric systems now combined in the New England Power Company.

Obituary

Charles Christopher Trowbridge, assistant professor of physics, Columbia University, died suddenly on Monday of blood poisoning. Professor Trowbridge, who was forty-eight years old, had been a member of the Columbia faculty since 1892. Owing to his efforts in physical research the Ernest Kempton Adams Precision Laboratory was founded at Columbia six years ago. The laboratory was given to the university by Edward Dean Adams in memory of his son, and Professor Trowbridge planned the laboratory and developed the institution until at the present time it is considered one of the best-planned and best-equipped laboratories of its kind in the country. In it are kept instruments equipped to determine with the highest accuracy facts affecting electricity and kindred subjects.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

ELECTRICAL EXPORTS FOR MONTH OF MARCH, \$5,147,921

Volume of Foreign Trade Is Falling Off, with Indications of Still Further Decrease in Future Months

Exports of electrical merchandise during the month of March last amounted to \$5,147,921, as compared with \$5,199,163 for March, 1917. During the month, however, there was a particularly large shipment of motors. This item reached a total of \$785,233. Telephone exports also were large, amounting in all to \$758,233.

During the nine months ended March last electrical exports reached a total of \$39,921,619, as compared with \$36,992,004 for the corresponding period of the previous year.

Electrical exports so far this year have been falling off in comparison with 1917, and with the most recent limitations on exports by the War Trade Board it seems very doubtful, unless the war comes to a close very quickly, that electrical exports will reach the total set last year. According to present indications, exports will be somewhere in the neighborhood of \$40,000,000 to \$50,000,000 for the year 1918.

The figures in the accompanying table were compiled by the Bureau of Foreign and Domestic Commerce.

	March		Nine Months Ended March	
	1917	1918	1917	1918
Articles				
Batteries	\$380,992	\$289,251	\$2,150,150	\$2,502,333

NEW OFFICIAL SPECIFICATIONS FOR RED-CEDAR POLES

Revised Standards Are Issued by the Producers' Association for 4-In., 20-Ft. and Larger Poles of This Description

The Western Red Cedar Association, Spokane, Wash., has issued the following official specifications, as revised April 30 last, for Western red-cedar poles 4-in., 20 ft. and larger:

1. Live Timber.—All poles must be manufactured from live growing cedar timber.
2. Manufacture.—All poles must be peeled, knots trimmed close and butts and tops sawed square.
3. Variation in Length.—Poles may be 6 in. longer or 3 in. shorter than length specified.

4. Knots.—Knots are not a defect if they are sound, trimmed smoothly and do not plainly impair the strength of the pole.

5. Discoloration.—Discoloration is not a defect.

TABLE NO. 1—MINIMUM TOP MEASUREMENT

Top Designation	Circumference, In.
4-in. top	12
5-in. top	15
6-in. top	18 1/2
7-in. top	22
8-in. top	25
9-in. top	28
10-in. top	31

6. Miscellaneous Defects.—No poles shall contain sap rot, woodpecker holes, plugged holes or evidence of having been eaten by ants.

7. Rot.—Tops of poles must be free from rot. Butt rot in center, including small ring rot, shall not exceed 10 per cent of the area of the butt. Butt rot of a character which impairs the strength of the pole above the ground line is a defect.

TABLE NO. 2—MINIMUM BUTT MEASUREMENT

Poles 35 ft. and longer shall have a minimum circumference measurement at extreme butt as follows:

Length, Ft.	7-In. Top, In.	8-In. Top, In.	9-In. Top, In.	10-In. Top, In.
25	33	36	39	42
40	34	37	40	44
45		39	42	45
50		41	44	47
55		42	45	48
60		44	47	50
65		45	48	51
70		47	50	53
75		48	51	54
80		50	53	56
85		51	54	57
90		52	55	58

8. Cat Faces.—Sound cat faces are not a defect if no part of the cat face shows on the upper one-fifth of the length of the pole or within 2 ft. above or 1 ft. below the ground line.

9. Dead or Dry Streaks.—A sound dead or dry streak is not a defect if it does not cover more than 25 per cent of the surface of the pole at any one point.

10. Minimum Measurements.—(a) The tops of all poles shall have a minimum circumference measurement as shown in Table No. 1. (b) The extreme butt of all poles shall have a minimum measurement as shown in Table No. 2. (c) Poles having a decided swell or flare at the butt shall

TABLE NO. 3—MAXIMUM ONE-WAY SWEEP

Length of Pole, Ft.	Maximum Sweep Between Top and Ground Line, In.
20	3
25	3
30	4
35	5
40	5 1/2
45	6
50	7
55	8
60	9
65	10
70	10 1/2
75	11
80	12
85	13
90	14

have a sufficiently larger measurement at butt to insure a reasonable measurement at the ground line.

11. Short Kinks.—Short kinks are not permitted.

12. Reverse Sweep.—Reverse sweep and two-way sweep, meaning a sweep in two planes, is permitted, provided a

straight line drawn from the center of pole at top to center of pole at ground line does not leave the pole at any point.

13. One-Way Sweep.—One-way sweep is permitted provided it does not exceed maximum shown in Table No. 3.

14. Method of Measuring Sweep.—That part of the pole below the ground line not to be taken into consideration. Tightly stretch a tape line from point at ground line (see paragraph 15) on the side of the pole where the sweep is greatest to the upper surface at the top of the pole, and having so done, measure widest point from tape to surface of pole and if, for illustration, upon a 30-ft. pole the widest point does not exceed 4 in., this pole shall be accepted.

15. Explanation of Term "Ground Line."—The term "ground line" as used in these specifications shall mean a point on the pole a distance of 4 ft. on 20-ft., 5 ft. on 25-ft. and 30-ft. and 6 ft. on 35-ft. and longer poles from the extreme butt.

HIGHER PRICES PUT ON ELECTRICAL APPARATUS

**Motors, Switchboards, Turbines, Transformers and
Generators Are Marked Up 10 per Cent—
Selling Terms Stricter**

Within the past ten days numerous announcements of advances in power-plant equipment have come out from the manufacturers. A general advance of 10 per cent on motors was made in the neighborhood of June 1. One of the leading manufacturing concerns sent the following notice to its agents:

"Effective Saturday noon, May 18, advance net selling price 10 per cent on all lines covered by apparatus, switchboard, turbine and motor price book sheets dated prior to May 16, pending receipt of revised price sheets or discounts."

Another company of prominence made the switchboard advance about the middle of May; but on motors of all sizes, alternating and direct current; transformers, generators and motor-generator sets its new prices went into effect June 3. Transformers, electric locomotives and some other specialties were made exceptions under the new ruling by the first-named concern. Special motor manufacturers in some cases also exempted fractional motors. Their lists became effective June 1.

It is held by the various manufacturers that a steady advance in the cost of material has rendered the increase in finished goods imperative. Further, it is also the opinion of several large producers who adjust their operations strictly on market and general conditions that a mark-up in a couple of months on all lines of electrical supplies should be no cause for special astonishment. The manufacturing situation, for obvious reasons, has been getting more acute within the last few months. It is safe to say, according to authorized statements, that with the still further anticipated scarcity and difficulty of obtaining material, shortage of skilled labor and other drastic contingencies, conditions are speculative and far from stable or certain. Therefore it is hard to tell what may occur.

With possibly one exception, the manufacturers have a standing rule of "price subject to change without notice," applicable to current buying and ordering. This concern stipulates that a leeway of fifteen days be allowed on all acceptance orders. For a while this clause was more or less loosely construed, but recently the trade was notified that it would be strictly enforced.

In the past it was the general practice in this branch of the industry to inform the trade in advance of a price increase. It was found, however, that some of the larger jobbers immediately proceeded to "load up" with goods to the disadvantage and detriment of the smaller buyers. In fact, it is said that several attempts were made to corner the market on motors. The factories were swamped with orders, and to protect the trade and check this tendency it was necessary to establish a system of allocation. This led up to the present method of wiring agents or house representatives of any change as being immediately effective, with no general notice to the trade. Buyers, under the circumstances, were uninformed until they actually came into the market.

THE WEEK IN TRADE

ADVANCING prices have been discussed and looked for in all parts of the country. Conditions due to the war are constantly changing, with almost kaleidoscopic effect. The actual happenings along this line justify expectations, for recently prices have actually been advanced on motors, turbines, transformers, generators and switchboards by the principal manufacturers. Some of the announcements became effective the middle of May, with the more recent dating from this week. It is even hinted that a further increase on general supplies may be looked for in a couple of months.

The shortage in conduit has not been overcome, New England points being in slightly better shape on some types. In the Far West substitution on color and size is in order. Fans are in active movement, distributors and jobbers who were forehanded in contracting for liberal stocks reaping the benefit of sound judgment, and supplies are being absorbed rapidly. Everywhere shipping delays are inconveniencing all branches of the trade, and no decided improvement is expected in the near future. The new increase in freight rates, effective June 25, is causing no little concern, particularly among jobbers distant from the factories.

Collections are reported as satisfactory in some sections and falling behind in others. An improvement is looked for. Credits are receiving close attention.

NEW YORK

Business in all departments of the electrical trade during the past week has been excellent. Occasional reports of a low supply or shortage of some staples are heard. As yet, however, no uneasiness is felt. Jobbers and distributors have in not a few instances anticipated their requirements for the fall and winter as much as possible. Manufacturers are not disposed to accept other than the usual orders from any one at the present time. They will do their utmost to take the best care of the old, steady customers, but new trade, unless gilt-edge and of the best repute, must take chances.

Some changes in prices were made, especially on motors, while mysterious suggestions of sharp increases on other lines are afloat. Collections represent a strong average, with credits held along an undeviating line of firmness.

WIRE.—Rubber-covered wire has hardened in price, an advance of from 2½ to 3 per cent being ordered by the manufacturers. The American Steel & Wire Company advanced the base price to 31 cents a pound.

DRY BATTERIES.—Stocks are in fair condition, and the demand is active. The high price of solder has not as yet influenced the dry-battery producers to change their prices. If this necessary material suffers a few more mark-ups—there have been drastic changes in the mill prices—an advance on the finished goods would be no surprise.

CONDUIT.—Jobbers report all sizes of conduit as being short in supply, with general stocks becoming weaker. The latest news from the mills is not reassuring by any means. Some producers are pushing their plants to the limit for output, and others have been required to curtail their operations to release steel for more pressing needs in war material.

PORCELAIN.—General report, which reflects current opinion, says that porcelain is hard to get. No advance in prices has materialized, though for a month reports of this tenor have been discussed by jobbers in the East. The government's requirements are still heavy, leaving little for commercial purposes.

COLLECTIONS AND CREDITS.—Credit men with leading jobbers and distributors state that collections are steadily

improving, the week's record being at least 5 per cent better than at the close of May. Credits are closely watched, with new accounts rigorously handled.

MOTORS.—Sizes from 25 hp. to 50 hp. are difficult to obtain. Within the past two weeks a number of the more prominent manufacturers have advanced their prices 10 per cent. One of them announces also that hereafter adherence to the fifteen-day price acceptance clause will be rigidly enforced.

HOUSEHOLD APPLIANCES.—Prominent New York department stores say that during the past few weeks their sales on household appliances, especially tableware, were not only very satisfactory but in some instances broke previous records. Sewing and washing machines led the list.

WIRING DEVICES.—Jobbers report a fair sale of wiring devices, particularly for suburban homes. The slump in building operations has worked havoc with the call for these staples, but there is still quite a movement. New England manufacturers are running their plants up to capacity on government orders.

SOCKETS.—Standard lamp sockets are said to be selling as well as could be expected at this time of year.

LAMPS.—The factories claim to have strong stocks on all the standard numbers, but have not yet quite caught up on miniatures. They are making good progress, and in a couple of weeks believe they will be on an even footing. Deliveries are shorter.

CHICAGO

The opinion of jobbers seems to be that while business is holding up fairly well, it is at this time rather unsettled and is in a state which makes it difficult to predict what the future will bring. The general plan followed by these distributors in the present market is to discover those points which are now most active and to make a special effort to keep sales representatives on the job at these points during as much of the time as possible. Prices still continue to increase.

The city of Chicago is still without a great deal of war work that it might handle if the government were convinced that the labor situation was bearable. Business men who are interested in getting war factories to come to Chicago feel very strongly that a strenuous effort should be made to get some sort of an understanding with labor which would permit the city to take care of its share of the country's war program.

Railroads are only buying from "hand to mouth." All have made up their budgets and, according to the newspapers, have been told how much they can spend in the coming year. None of the roads in this territory, however, has yet had official announcement on this point. While business with the roads is not so good now as it should be, it is momentarily expected that something will open up in this line.

In Chicago shipbuilding activities largely consist of making over passenger vessels into freight vessels and doing other repairs. The buying for some of this work is being done in Cleveland. Further north along Lake Michigan the activity is more intense, and Chicago and Milwaukee jobbers are securing some of this business.

LAMPS.—Distributors report that stocks are accumulating on all sizes except 75-watt. This does not apply to the miniature lamp business, where the shortage of stock still is acute.

WIRE.—Rubber-covered wire has advanced about 10 per cent.

CONDUIT.—The situation in the metal conduit field is still bad. It is most essential now to be able to tell where conduit is going before it can be secured, as there is a tendency to curtail the use of this class of goods in any except war work.

SCHEDULE MATERIAL.—There has been an increase in this class of goods which amounts in the aggregate to about 8 per cent.

FANS.—Even as far north as Chicago jobbers report that fans are moving in good fashion. Further south the activity in this class of goods is reported to be still better.

INDUSTRIAL LIGHTING FIXTURES.—Sales are bigger this spring than last, indicating that the operators of plants which have night shifts are breaking over the seasonable precedent and are buying fixtures right through the summer.

BOSTON

No let-up is to be seen in the volume of trade, speaking generally. This is a natural result of the accelerating war preparations of industrial New England, which are throwing a flood of orders upon jobbers and which are giving the contractor some important work in the way of plant remodeling, extensions and some new construction. The pressing claims of war funds are influencing collections a little unfavorably. Trade acceptances are being used with good results between jobbers and contractors, but credits are being very carefully watched. Transportation congestion is very serious in spite of open-weather conditions. Work is progressing rapidly at the army and naval bases, and the shortage of labor reported last week tends to grow more and more acute. There is a good deal of unrest in the textile industry at present, but in the main labor seems to be continually employed, although the turnover is abnormally high. A 10 per cent advance in prices took effect June 1 on Lincoln motors, otherwise prices are showing little change.

FANS.—The retail trade is picking up rapidly, and some dealers report an unusually heavy demand for fans, despite increased prices. Jobbers are well stocked, and one house reports fan sales of over \$2,000 so far this season. Another house has received nearly 8000 fans from the factories and notes a larger demand from the distributors in the retail trade than at this time a year ago. Some buying for summer homes is in evidence.

STORAGE BATTERIES.—The automobile trade is buying heavily, especially for renewal business. Stocks are still pretty well prepared for this call, but there is some question how long orders can be filled immediately upon receipt, owing to railroad congestion and enormous government demands. No price changes have been heard of since April.

LAMPS.—As the central-station demand sags off stocks are increasing somewhat. A shortage is reported in miniature sizes, factories being from three to six months behind on orders. Ordinary sizes are now well in hand, and if the anticipated coal-saving campaign develops as expected, conditions should be much easier this fall than during the past winter.

FIRE-ALARM APPARATUS.—A substantial demand is reported at present for protective equipment for industrial plant service. One maker reports that he has more orders on his books than he can fill.

MOTORS.—Prices remain steady, with the exception of a 10 per cent advance by the Lincoln Electric Company dating from June 1. Government commandeering of steel and labor scarcity are factors in the increase. Delays in shipments are proving troublesome. One dealer reports that he has received no motors for stock additions since the last of April, and that an important shipment has been three weeks en route between New York and Boston. The demand for alternating-current motors seems to predominate.

ELECTRIC WELDING APPARATUS.—Increasing interest in this equipment is noted in New England, and the outlook is exceptionally good for its use in shipyard, railroad and metal repair shop service.

CONDUIT.—Rigid pipe is plentiful in sizes up to and including ¾-in., but above this it is very difficult to obtain deliveries even on quasi-government work. The demand for larger-sized pipe continues heavy in connection with war-service plants, where first-class wiring now appears to be an essential on account of the severe working conditions present.

SMALL STEAM TURBINES.—Few commercial orders, so called, are being received at present in comparison with naval requirements. Quotations for commercial delivery give little hope of meeting the purchaser's requirements in less than five months.

APPLIANCES.—A Boston department store reports exceptionally active sales in percolators and curling irons. Small electric cooking devices in general are in good demand. Few central stations are doing much with ranges at the moment, but here and there sales are being recorded even of large units.

ATLANTA

Jacksonville, Fla., has been named as one of the locations for the establishment of yards for the construction of concrete ships. Official announcement covering details will be available very soon. For those that have been following the rapid expansion and influx of population at Southeastern coastal cities, it will be of interest to note the announcement of the War Department to the effect that the Butterworth-Judson Corporation of New York City has secured a contract to erect a plant for the manufacture of picric acid on Turtle Island, three miles from Brunswick, Ga., costing \$7,000,000. The plant itself will cost \$5,000,000 and the industrial city \$2,000,000.

These developments will have a tendency to stimulate sales in all electrical staples and to expand the market for marine supplies at Jacksonville and heavy apparatus at Brunswick. The Marion Coal & Lumber Company of Chattanooga, Tenn., has been incorporated for \$1,000,000. This company will open up timber and coal land, accelerating the market for electric locomotives, generating apparatus and miscellaneous equipment.

FANS.—The hot wave this week has started a heavy movement of fans to all outlying sections, the demand for all sizes being strong. A large number of the ceiling type are being used locally. A few jobbers' stocks are in excellent shape, but others are experiencing great difficulty with the transportation problem. Shipments received are absorbed before stocks have a chance to accumulate.

AUTOMOBILE SUPPLIES.—There is no cessation in the call for spotlights, and prompt deliveries are made in the face of this pressure. The demand continues for miniature lamps, with some improvement in shipments, which is accounted for by the jobbers by the fact that factories are getting ahead with stocks.

ENTRANCE CUT-OUTS.—Stocks are very good considering the heavy draft that is evidenced by an ever-swelling volume of business.

LABOR-SAVING DEVICES.—Sewing-machine motors are moving freely. A brisk trade has been done this week in washing machines, dish-washers and churns. While vacuum cleaners are not quite so active, a satisfactory volume of business is being transacted for this time of the year.

ELECTRIC RANGES.—Manufacturers and jobbers report a very good business in these, the states most active being Florida and South Carolina. The latter State handles the larger volume at this time.

SEATTLE

In spite of holiday sales the volume of business for the past week nearly equaled that of the week previous. The volume to shipyards and industrials was maintained but there was a slight decrease in commercial business. Government buying too, was noticeably less. Freight from Eastern factories is subject to serious delays, and local jobbers are considerably inconvenienced. Jobbers have practically given up hope of improvement. Mix-ups and delays in L. C. L. shipments are the rule. Outgoing freight, both rail and steamship, is terribly congested. A slight impetus in sales of power apparatus, particularly of the smaller-size motors, is noted. There has been no change in price of any consequence. Dealers are apprehensive about an announced increase of 25 per cent in freight rates and are anxiously awaiting specific information.

As usual, activities pertaining to the Puget Sound, Gray's Harbor and Columbia River shipyards command the center of the stage, aside from actual shipbuilding, which is going on night and day. During the first five months of the year

the Seattle yards have launched twenty-two steel ships, aggregating 180,400 deadweight tons, all for the Shipping Board. In addition, one wooden steamship for the government and seven wooden ships for foreign governments and private interests were launched during the week. The Shipping Board awarded contracts to the Seattle yards involving \$31,000,000. The contracts are for nineteen 8800-ton steel freighters. In less than a month the Shipping Board has added more than \$130,000,000 to Seattle's shipbuilding contracts. The yards obtaining the above contracts will make enormous extensions to the present establishments.

Portland reports that the supply of vacant dwellings is exhausted and the demand increasing daily. In spite of increased building activity in residence sections, towns in the Gray's Harbor district to date have been unable to meet urgent demands for housing. Record residence construction in Seattle and Tacoma continues unabated, notwithstanding the excessive costs of materials. New business accepted by the West Coast lumber manufacturers during the past week was the greatest for any single week in more than six months.

Seattle retailers report fixture and small domestic appliance sales for the past week very satisfactory. In spite of the holiday considerable out-of-town business was received, particularly from Bremerton, where unprecedented residence building is under way. Local retail sales were on an equal level with the past few weeks. Conduit shortage is extremely acute. Shipyards, the principal users, are forced in many cases to resort to substitution. For instance, if black cannot be obtained white will be used, and the same applies in sizes. Substitution is also practiced in the larger type of lamps. The scarcity of the smaller lamps is practically overcome. The lamp sales in all sizes to shipyards have increased considerably over the past month.

METAL MARKET SITUATION

Orders and Deliveries on Copper Closely Scrutinized
—Tin Coming in Stronger

Apparently there is no trouble in getting all the copper needed for commercial consumption, although deliveries are uncertain. No complaint is heard on the part of wire and cable producers that the metal is difficult to obtain in any reasonable quantity when its purpose is disclosed to the official distribution committee. It is said the producers continue to book domestic orders with reluctance and great circumspection and shipments are closely looked after. The jump in the price of zinc by government designation was a surprise to outsiders. Tin is reaching this market in better quantities.

The new maximum base price for aluminum, effective June 1 to Sept. 1, has been fixed by the President at 33 cents a pound, under an agreement between producers and the War Industries Board. This figure applies to the ingot of 98 to 99 per cent grade in lots of 50 tons or more. Differentials for sheet, rod and wire will be increased about 12½ per cent. Advances in freight rates on June 25 may affect future prices on steel following June 30.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.
